Tungsten is placed in contact with either molybdenum, tantalum, niobium, vanadium, rhenium, or other metal of atoms having a different diffusion coefficient than tungsten. The metals are heated so that the atoms having the higher diffusion coefficient migrate to the metal having the lower diffusion rate, leaving voids in the higher diffusion coefficient metal. Heating is continued until the voids are interconnected.

21095 Magnetic and electronic properties of Ni films, surfaces, and interfaces. Tersoff, J.; Falicov, L.M. (Materials and Molecular Research Division, Lawrence Berkeley Laboratory and Department of Physics, University of California, Berkeley, California 94720). *Physical Review* [*Section*] *B: Condensed Matter;* **26**: No. 11, 6186-6200(1 Dec 1982).

Results of various calculations lead to a unified understanding of the magnetic behavior of thin nickel films. We thus explain disparate experimental results. We report results for magnetic and electronic properties of Ni films of one to five atomic layers on Cu (100) and (111), of the Ni-Cu (100) and (111) interfaces, and of the Ni (100) and (111) surfaces. Results are in good agreement with the few published calculations. We find that magnetization is suppressed at the Ni-Cu interface, but enhanced in isolated thin films. The net effect of this competition is that a Ni monolayer is substantially magnetic on Cu(100) but paramagnetic (or nearly so) on Cu(111). Film magnetization is found to be very sensitive to substrate composition. For substrates which couple strongly to the Ni film, ferromagnetism first appears at about three atomic layer Ni, in quantitative agreement with experiments based on Al and Pb-Bi substrates. The crucial mechanism acting to suppress Ni magnetization is sp-d hybridization, just as in most Ni alloys.

21096 Absence of phason contribution in the specific heat of potassium. Van Curen, J.; Hornung, E.W.; Lasjaunias, J.C.; Phillips, N.E. (Department of Chemistry, University of California, Berkeley, California 94720). *Physical Review Letters;* **49**: No. 22, 1653-1656(29 Nov 1982). Contract AC03-76SF00098.

The specific heat of potassium has been measured between 0.33 and 20 K, on an accurate and well documented temperature scale. The results show no evidence of the previously reported phason contribution.

21097 Electronic structure of clean and carbon-covered closed-packed rhodium and ruthenium surfaces. Feibelman, P.J. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Physical Review* [*Section*] *B: Condensed Matter;* **26**: No. 10, 5347-5356(15 Nov 1982).

In order to determine the nature of the active species which several groups have found to be important in catalytic carbon hydrogenation reactions, self-consistent linear combination of atomic orbitals (LCAO) calculations have been performed of the electronic structure of clean and C-covered Rh(111) and Ru(0001) surfaces. Apart from the shift of the Fermi level to higher energy to accomodate an extra electron per atom in Rh, the results are quite similar for the two metals. A (1 x 1) layer of C's, occupying threefold-coordination sites binds by forming tetrahedral bonds with its neighbors, leaving a nonbonding p/sub z/ band at the Fermi energy. Thus the model C species examined here should be very reactive. Additionally, the C 2s—C 2pz binding-energy difference is about 10 eV, in accord with the Auger-peak separation seen by Goodman et al. for a reactive carbidic layer on Ni. Partial local density of states (LDOS) and energy-band dispersion curves are presented to permit the verification of the model carbidic overlayer. Results presented for the clean surfaces include work functions that are in excellent accord with the measured values, and band dispersions, notably a surface resonance band that has been observed on Ru, by Himpsel et al. Finally, surface-bulk core-level binding-energy shifts have been calculated. For the clean surfaces, they are in reasonable agreement with empirical heats of segregation. For the C-covered surfaces, they indicate that C binds most strongly to Ru, followed by Rh and Pd.

21098 Phonon dispersion curves of fcc La. Stassis, C.; Loong, C.; Zarestky, J. (Ames Laboratory and Department of Physics, Iowa State University, Ames, Iowa 50011). *Physical Review* [*Section*] *B: Condensed Matter;* **26**: No. 10, 5426-5432(15 Nov 1982). Contract W-7405-ENG-82.

Large single crystals of fcc La were grown in situ and were used to study the lattice dynamics of this phase of La by coherent inelastic neutron scattering. The phonon dispersion curves have been measured along the [ξ00], [ξξ0], [ξξξ], and [0ξ1] symmetry directions at 660 and 1100 K. The T[ξξξ] branch exhibits anomalous dispersion for $\xi > 0.25$ and, in addition, close to the zone boundary, the phonon frequencies of this branch decrease with decreasing temperature. This soft-mode behavior may be related to the $\beta \rightarrow \alpha$ transformation in La, an assumption supported by recent band-theoretical calculations of the generalized susceptibility of fcc La. At X the frequencies of the L[ξ00] branch are considerably lower than those of the corresponding branch of γ-Ce; a similar but not as pronounced effect is observed for the frequencies of the L[ξξξ] branch close to the point L. Since the calculated generalized susceptibility of fcc La exhibits strong peaks at X and L, these anomalies may be due to the renormalization of the phonon frequencies by virtual fbold-arrow-left-rightd transitions to the unoccupied 4f level in La. The data were used to evaluate the elastic constants, the phonon density of states, and the lattice specific heat at constant pressure C/sub P//sup(1/).

21099 Theory of static structural properties, crystal stability, and phase transformations: Application to Si and Ge. Yin, M.T.; Cohen, M.L. (Department of Physics, University of California, and Materials and Molecular Research Division, Lawrence Berkeley Laboratory, Berkeley, California 94720). *Physical Review* [*Section*] *B: Condensed Matter;* **26**: No. 10, 5668-5687(15 Nov 1982).

We demonstrate that not only the static structural properties but also the crystal stability and pressure-induced phase transformations in solids can be accurately described employing an ab initio pseudopotential method within the local-density-functional formalism. With the use of atomic numbers of constituent elements and a subset of crystal structures as the only input information, the calculated structural properties of Si and Ge are in excellent agreement with experiment.

21100 Radiative decay of surface plasmons on oblate spheroids. Little, J.W.; Ferrell, T.L.; Callcott, T.A.; Arakawa, E.T. (Health and Safety Research Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Physical Review* [*Section*] *B: Condensed Matter;* **26**: No. 10, 5953-5956(15 Nov 1982). Contract W-7405-ENG-26.

We have obtained a general expression for the radiative decay rate of surface-plasmon modes on oblate spheroids in terms of familiar spherical functions. Experimental observations of the polarization, wavelength, and angular dependence of light emitted by electron-bombarded silver spheroids were compared with the theoretical calculations, and good agreement was obtained. We have shown that it is possible to use both nonretarded electrodynamics and bulk-metal optical properties to describe plasmons on particles with 10—40 nm dimensions. The results given can be used to study the angular and wavelength characteristics of other plasmon-related effects such as photoemission and surface-enhanced Raman scattering.

21101 **Enhanced thermal conduction associated with formation of the superionic state.** Williams, R.K. (Metals and Ceramics Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Physical Review [Section] B: Condensed Matter;* **26**: No. 10, 5983-5986(15 Nov 1982). Contract W-7405-ENG-26.

High anion mobilities associated with formation of the superionic state in fluorite crystals may lead to a measurable enhancement of the thermal conductivity. The enhancement was estimated for $SrCl_2$, and found to reach a maximum value of about 0.02 W/m K. The temperature dependence of the effect differs from that of ambipolar thermodiffusion of electron-hole pairs. The enhancement due to ionic transport is dependent on the thermodynamics of the anion disordering process, and some experimental tests of the mechanism are suggested.

21102 **Deuterium re-emission from 304LN stainless steel.** Wilson, K.L.; Baskes, M.I. (Sandia National Labs., Livermore, CA (USA)). *Journal of Nuclear Materials;* **111**: 622-627(Nov-Dec 1982).

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

Deuterium re-emission measurements have been conducted on 304LN stainless steel implanted cyclicly with 10 keV D^+ or D_2^+ at temperatures from 35 to 95°C. Re-emission during implantation was more rapid at the higher temperatures, but slowed markedly for the higher-energy implantations. The data are consistent with a model involving diffusion in the presence of trapping sites with a recombination boundary condition. Detrapping from an approx. equal to 0.8 eV radiation damage trap appears to be the rate limiting step for release in the temperature range of 35 to 65°C. Molecular recombination becomes important for implantation temperatures approx. $>=$ 95°C. The model is applied to wall re-emission calculations for tokamaks such as TFTR.

21103 **Deuterium retention in helium-damaged stainless steel: detrapping energy.** Pontau, A.E.; Baskes, M.I.; Wilson, K.L.; Haggmark, L.G. (Sandia National Labs., Livermore, CA (USA)); Bohdansky, J.; Scherzer, B.M.U.; Roth, J. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). *Journal of Nuclear Materials;* **111**: 6[illegible]-653(Nov-Dec 1982).

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

Published in summary form only.

21104 **He bubbles in Ni: a small-angle X-ray scattering study.** Haubold, H.G.; Lin, J.S. (Oak Ridge National Lab., TN (USA). Metals and Ceramics Div.). *Journal of Nuclear Materials;* **111**: 709-714(Nov-Dec 1982).

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

The bubble distance of 80 A was found to remain unchanged in the concentration range Csub(He) = 0.06 - 1.1%. This indicates a low-dose nucleation with an interbubble distance of about 80 A. At higher doses, the bubbles grow and tend to rearrange themselves in an energetically more favorable 'lattice structure' with ordering mainly on [111]-planes. The bubbles are found to be strongly pressurized with a He pressure p = 300,000 bar for R = 11.7 A. This pressure is estimated to be high enough for a dislocation loop punching mechanism. (111)-plane punching is expected to be energetically most favorable, and to shift the bubble position along the <111>-directions. This could explain the ordering that was observed along [111] for the higher dose. The state of the helium in these bubbles is superdense: $n = 0.18\ A^{-3}$ for bubbles with a radius, R = 11.7 A. This density exceeds that necessary for He to be solid at room temperature.

21105 **Hydrogen ion impact desorption of adsorbed deuterium from stainless steel.** Bastasz, R.; Haggmark, L.G. (Sandia National Labs., Albuquerque, NM (USA). Physical Metallurgy Div.). *Journal of Nuclear Materials;* **111**: 805-808(Nov-Dec 1982).

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

The removal of adsorbed deuterium for stainless steel by energetic molecular hydrogen ions (H_2^+ and H_3^+) has been studied with secondary ion mass spectrometry. Desorption cross sections for this process range from 1.2 x 10^{-16} cm^2 to 5 x 10^{-17} cm^2 for incident ion energies 0.3 to 1.5 keV/atom. The cross sections increase as the incident ion energy is lowered. At low energies, direct interactions between incident particles and adsorbate atoms appear to be important in causing desorption. Dissociation of molecular hydrogen ions occurs prior to desorption. The implications of these findings with respect to the mechanisms for ion impact desorption and to fuel recycling phenomena in tokamaks are discussed.

21106 **Electron-electron scattering in vanadium.** Gautron, G.J.; Zablocki, J.E.; Hsiang, T.Y.; Weinstock, H.; Schmidt, F.A. (Department of Physics, Illinois Institute of Technology, Chicago, Illinois). *Journal of Low Temperature Physics;* **49**: No. 1, 185-191(1 Oct 1982).

Measurements have made over a range from liquid helium to room temperature of the electrical resistivity of a single crystal of vanadium with residual resistance ratio (RRR) of 1974, the highest ever reported. The data were analyzed in terms of electron-impurity scattering, electron-electron scattering, and electron-phonon interband and intraband scattering. We have obtained a T^2 electron-electron scattering coefficient of (1.6 +- 0.2) x 10^{-11} $\Omega cm/K^2$, in agreement with that obtained earlier in the same laboratory on a crystal with lower purity. Therefore, we conclude that electron-electron scattering does contribute measurably to the electrical resistivity of vanadium at low temperature.

21107 **Vacuum brazing beryllium to Monel.** Glenn, T.G.; Grotsky, V.K.; Keller, D.L. (Rockwell International Corp., Rocky Flats Plant, Golden, CO). *Welding Journal (Miami);* **61**: 334.S-338.S(Oct 1982). (CONF-820449—).

From 63. annual meeting of the American Welding Society; Kansas City, MO, USA (26 Apr 1982).

The tensile strength of beryllium to Monel vacuum furnace brazed joints was studied. The filler used was the 72% Ag-28%Cu(BAg-8) alloy. The strength of these joints, which require the use of a titanium hydride powder or physical vapor deposited titanium wetting agent on the beryllium, was found to approach the yield strength of the base metals. Strength was found to be reduced by the interaction of increased titanium hydride quantity and brazing time. Metallographic and scanning electron microscope (SEM) studies correlated these effects with microstructure. The formation of the brittle copper-beryllium delta phase was found to require conditions of high brazing temperature and the presence of a reservoir of the copper-containing filler such as found in fillet areas. Two other filler metals: pure silver, and a 60% Ag-30% Cu-10%Sn (BAg-17) alloy were shown to be acceptable alternatives to the BAg-8 alloy in cases where the filler metal can be preplaced between the base metal surfaces.

21108 **Production of aluminum metal by electrolysis of aluminum sulfide.** Minh, N.Q.; Loutfy, R.O.; Yao, N.P. US Patent Application 6-364,282. 1 Apr 1982. 19p. Contract W-31-109-ENG-38.

Metallic aluminum may be produced by the electrolysis of Al_2S_3 at 700 to 800°C in a chloride melt composed of one or more alkali metal chlorides, and one or more alkaline earth metal chlorides and/or aluminum chloride to provide improved operating characteristics of the process.

21109 **Gas-tungsten arc welding of aluminum alloys.** Frye, L.D. US Patent Application 6-361,932. 25 Mar 1982. 14p. Contract W-7405-ENG-26.

The present invention is directed to a gas-tungsten arc welding method for joining together structures formed of aluminum alloy with these structures disposed contiguously to a heat-damagable substrate of a metal dissimilar to the aluminum alloy. The method of the present invention is practiced by diamond machining the fay surfaces of the aluminum alloy structures to profice a mirror finish thereon having a surface roughness in the order of about one microinch. The fay surface are aligned and heated sufficiently by the tungsten electrode to fuse the aluminum alloy continguous to the fay surfaces to effect the weld joint. The heat input used to provide an oxide-free weld is significantly less than that required if the fay surfaces were prepared by using conventional chemical and mechanical practices.

21110 Photoelectric determination of work function via CREMSEE enhancement: photo-CREMSEE. Nilges, M.; Freed, J.H. (Cornell Univ., Ithaca, NY). *Chemical Physics Letters;* **85**: No. 5/6, 499-504(29 Jan 1982).

CREMSEE (cyclotron resonance from microwave-induced secondary electron emission), operated at a microwave power level just below threshold for self-sustaining signals may be used as an electron-amplifier and detector of photoelectrons. A determination of the work function of air-oxidized Ag on the interior surface of a uhv-microwave cavity yields 4.06 +- 0.05 eV.

21111 X-ray diffuse scattering from several platinum-atom chain 1-D conductors and a detailed investigation of the solid-state properties of $Rb_3(H_3O)_{0.2}[Pt(CN)_4](O_3SO.H.OSO_3)_{0.5}.0.8H_2O$. Coles, G.S.V. (Technical Univ. of Denmark, Lyngby); Lindegaard-Andersen, A.; Williams, J.M.; Schultz, A.J.; Brown, R.K.; Besinger, R.E.; Ferraro, J.R.; Underhill, A.E.; Watkins, D.M. *Physica Scripta;* **25**: 873-878(1982). Contract W-31-109-ENG-38.

X-ray diffuse scattering studies at room temperature for seven one-dimensional metallic complexes are reported. The crystal structure and the temperature dependence of both the electrical conductivity and x-ray diffuse scattering for $Rb_3(H_3O)_{0.2}[Pt(CN)_4](O_3SO.H.OSO_3)_{0.5}.0.8H_2O$ are reported and related to the development of a non-Peierls superstructure below room temperature. The Rb complex is unique in that it contains a polyatomic (>2) trianion and a ratio of three alkali metal ions per Pt atoms instead of the usual two.

21112 Role of electron scattering in the surface enhanced Raman effect on Ag-Au alloys. Kester, J.J. (Ames Lab., IA); Furtak, T.E. *Solid State Communications;* **41**: No. 6, 457-460(1982). Contract W-7405-ENG-82.

SERS has been observed from AgAu alloys using incident photon energies above and below the onset for interband transitions. Below the onset, electron scattering processes due to alloying cause a decrease in SERS intensity below that observed on either pure metal. This behavior is most easily explained by theories which are based on the optical properties of the substrate.

21113 Grain boundary precipitation in aluminum alloys: effect of boundary structure. Gronsky, R. (Lawrence Berkeley Lab., CA); Furrer, P. *Metallurgical Transactions, [Section] A: Physical Metallurgy and Materials Science;* **12**: 121-127(Jan 1981). Contract W-7405-ENG-48.

A transmission electron microscope study of grain boundary precipitatrion in Al-Zn and Al-Zn-Mg alloys has been conducted with emphasis on the influence of localized boundary structure. Intrinsic grain boundary defects are found to have a significant effect on the precipitation sequence in that they assist the emerging precipitates in establishing a low energy habit plane relationship with at least one bordering grain. Under more extreme conditions of unavailable habits or unfavorable intrinsic structures, extrinsic defects dominate the precipitation reaction.

21114 Pulsed laser mixing of Ni-Au surface films on nickel substrates. Pronko, P.P.; Wiedersich, H.; Seshan, K.; Helling, A.L.; Lograsso, T.A.; Baldo, P.M. (Argonne National Lab., IL). pp 599-606 of Laser and electron-beam solid interactions and materials processing. Gibbons; Hess; Sigmon (eds.). Amsterdam, Netherlands; Elsevier North Holland, Inc. (1981).

The melt phase alloying of Ni-Au films on Ni substrates has been studied for rapid quenches following 35 nano-second Q switched ruby laser pulses (0.69μ wavelength) in the energy regime of 0.5 to 3.0 j/cm^2. The Ni and Au films were each 200 angstroms in thickness having been deposited on a polished Ni substrate by standard hot ribbon vapor deposition methods. Data was obtained on pre and post alloyed surface layers using Rutherford backscattering (RBS) transmission electron microscopy (TEM) and scanning TEM energy dispersive X-ray analysis. The melting and resolidification dynamics of the liquid-solid interface was monitored through finite difference integration of the non-linear heat conduction equation to give temperature profiles, depth of melting and melt front velocities associated with the liquid-solid phase change. Resolidification velocities were typically 15 meters/second with melt depths extending to a few thousand angstroms depending on pulse energy. RBS data confirms that liquid phase diffusion of gold in nickel has occured. TEM analysis reveals the presence of a two phase mixture being composed of nickel rich and gold rich material. Microbeam energy dispersive X-ray analysis indicates the presence of a relatively uniform mixing of these two phases.

21115 Effects of pressure on the mixed valent properties of Ce and its intermetallic compounds. Liu, S.H. (Oak Ridge National Lab., TN). pp 327-333 of Physics of solids under high pressure. Schilling, J.S.; Shelton, R.N. (eds.). Amsterdam, Netherlands; North Holland Publishing Company (1981). Contract W-7405-ENG-26.

The rare earth element Ce and a number of rare earth compounds exhibit valence transition under pressure. This has been one of the most active research topics in recent years. There also exist several intermetallic compounds of Ce that do not undergo abrupt valence changes. Instead, the valence varies continuously with pressure or temperature. A systematic high presure study of these compounds will further elucidate the phenomenon of valence fluctuation. For these materials, the single parameter which is most sensitive to the pressure is the position of the Ce 4f level relative to the conduction bands. Therefore, it should be possible to monitor the valence with pressure and follow the evolvement of the system from a local moment state to a nonmagnetic state. The latter may be a spin compensated Kondo lattice state of a lattice of virtual bound states. The experimental evidence of these exotic states is reviewed and new experiments to investigate their physical properties are suggested.

21116 The parabolic growth of oxide solid solutions on binary alloys: a semiempirical approach. Whittle, D.P. (Lawrence Berkeley Lab., CA); Gesmundo, F.; Viani, F. *Oxidation of Metals;* **16**: No. 1/2, 81-98(1981). Contract W-7405-ENG-48.

The growth of solid solution oxide scales on alloys has been described by considering either the transport of the cations themselves, or that of the defect species in the oxide lattice. The two approaches have been shown to be similar. However, it has become apparent that the simplified defect model implicitly assumed in previous analyses using the ionic transport approach is not adequate to fully describe the variation of ionic diffusivities with oxygen potential or oxide composition. Further analyses, using a combination of the two approaches, are suggested.

21117 (AD-A—111575) Thermo-mechanical and thermal behavior of high-temperature structural materials. Hasselman, D.P.H.; Bentsen, L.D.; Brennan, J.J.; Claussen, N.; Knight, C.E. (Virginia Polytechnic Inst. and State Univ., Blacksburg (USA)). Dec 1981. 179p. NTIS, PC A09/MF A01.

The thermomechanical and thermal behavior of high temperature structural materials wre reported as follows: (1) observations on the characteristics of a fluidized bed for the thermal shock testing of brittle ceramics, (2) effect of delta-T and spatially varying heat transfer coefficient on thermal stress resistance of brittle ceramics measured by the quenching method, (3) analysis of effect of crack interaction on nature of strength loss in thermally shocked brittle ceramics, (4) analysis of thermal fatigue behavior of brittle structural materials, (5) analysis of thermal stresses in a partially absorbing plate asymmetrically heated by cyclic thermal radiation and cooled by convection, (6) anisotropy effects in the thermal diffusivity of Si_3N_4-BN composites, (7) thermal diffusivity of silicon carbide-silicon composites, (8) effect of microcracking on the conduction of heat in brittle composites, (9) measurement of the thermal conductivity and diffusivity of fine silicon carbide fibers by the composite technique, and (10) thermal stress in materials heated internally by radiation absorption.

21118 **(AD-A—116581/0) The role of additives in the densification of nitrogen ceramics. Annual report no. 2 (final).** Jack, K.H. (Newcastle upon Tyne Univ. (UK)). Oct 1979. 97p. NTIS, PC A05/MF A01.

Densification of silicon nitride by either hot-pressing or pressureless sintering requires an additive which reacts with the surface silica and some of the nitride to give an oxynitride liquid that promotes shrinkage and, at the same time, the phase transformation from alpha to beta. Silicon nitride is densified by hot-pressing with scandia additive but theoretical density is not achieved by pressureless sintering. The kinetics of densification are interpreted in terms of a Kingery model with a slope of one-third for the solution-precipitation stage indicating that solution of alpha or precipitation of beta is rate-controlling. Sintering with equal weights of scandia and alumina gives improved densities. An important advantage over beta yttrium sialon is that the quaternary scandium oxynitride and glassy grain boundary phases do not undergo catastrophic oxidation at 1000 C.

21119 **(CONF-820325—13) Stabilities, stoichiometries, and site occupancies in hydrides of intermetallic compounds. Final report.** Westlake, D.G. (Argonne National Lab., IL (USA)). Feb 1982. Contract W-31-109-ENG-38. 13p. NTIS, PC A02/MF A01. Order Number DE83007958.

From International symposium on the electronic structure and properties of hydrogen in metals; Richmond, VA, USA (4 Mar 1982).

In the literature, one can find numerous attempts to explain the observed stabilities, stoichiometries and site occupancies in hydrides of the various families of intermetallic compounds. Some of the approaches to these problems are critically reviewed here. For some, but not all such hydrides, the stabilities have been shown by different researchers to correlate with the enthalpy for formation of the intermetallic compound, itself, or with cell size, or electronic properties, or elastic properties. It appears, therefore, that all of these effects may play a role, but none is dominant in all cases. The development of the procedure for qualitative and quantitative determinations of H-site occupancy from calculations of enthalpies for the formation of imaginary binary hydrides was reviewed. Such inspection raises the question of possible fortuitous agreement between experimental observations and predictions arising from the technique. The concepts of minimum hole size for H occupation and minimum H-H distance in stable hydrides of metals or intermetallic compounds have been discussed in terms of their importance to preferred H sites and to stoichiometry, and considerations necessary to a geometric model have been outlined. The model is used to rationalize observed H sites and stoichiometry of $LaNi_5H$/sub x/. The review points up the need for theoretical treatment leading to fundamental understanding of such systems. 2 figures.

21120 **(CONF-820929—11) Neutron-scattering studies of magnetic superconductors.** Sinha, S.K.; Crabtree, G.W.; Hinks, D.G.; Mook, H.A.; Pringle, O.A. (Argonne National Lab., IL (USA); Oak Ridge National Lab., TN (USA)). 1982. Contract W-31-109-ENG-38. 27p. NTIS, PC A02/MF A01. Order Number DE83007814.

From IUPAP international conference on magnetism; Kyoto, Japan (6 Sep 1982).

Results obtained in the last few years obtained by neutron diffraction on the nature of the magnetic ordering in magnetic superconductors are reviewed. Emphasis is given to studies of the complex intermediate phase in ferromagnetic superconductors where both superconductivity and ferromagnetism appear to coexist.

21121 **(CONF-8206160—1) Impurity diffusion in transition-metal oxides.** Peterson, N.L. (Argonne National Lab., IL (USA)). Jun 1982. Contract W-31-109-ENG-38. 44p. NTIS, PC A03/MF A01. Order Number DE83007617.

From 2. international conference on transport in non-stoichiometric compounds; Perpignan, France (28 Jun 1982).

Intrinsic tracer impurity diffusion measurements in ceramic oxides have been primarily confined to CoO, NiO, and Fe_3O_4. Tracer impurity diffusion in these materials and TiO_2, together with measurements of the effect of impurities on tracer diffusion (Co in NiO and Cr in CoO), are reviewed and discussed in terms of impurity-defect interactions and mechanisms of diffusion. Divalent impurities in divalent solvents seem to have a weak interaction with vacancies whereas trivalent impurities in divalent solvents strongly influence the vacancy concentrations and significantly reduce solvent jump frequencies near a trivalent impurity. Impurities with small ionic radii diffuse more slowly with a larger activation energy than impurities with larger ionic radii for all systems considered in this review. Cobalt ions (a moderate size impurity) diffuse rapidly along the open channels parallel to the c-axis in TiO_2 whereas chromium ions (a smaller-sized impurity) do not. 60 references, 11 figures.

21122 **(DOE/ER/10654—T1) Optical and electrochemical investigation of ruthenium and iridium and their oxides in relation to their electrocatalytic activity. Progress report.** Pollak, F.H. (Brooklyn Coll., NY (USA). Dept. of Physics). Feb 1983. Contract AC02-80ER10654. 46p. NTIS, PC A03/MF A01. Order Number DE83006563.

Large crystals of RuO_2 were grown. Raman spectra and magnetic susceptibility of single-crystal RuO_2 were measured. Preliminary channeling studies were also performed. Electrochemical investigations of single-crystal RuO_2 included cyclic voltammetry, hydrogen adsorption/desorption reactions, potential of zero charge, ad chlorine evolution reaction. A study of the surface structures of RuO_2 (110) and (100) was begun using LEED, AES, and XPS. 20 figures. (DLC)

21123 **(DOE/ER/12069—T1) Experimental test to unify sintering theory. Progress report.** Doremus, R.H.; German, R.M. (Rensselaer Polytechnic Inst., Troy, NY (USA). Dept. of Materials Engineering). 1982. Contract AC02-82ER12069. 8p. NTIS, PC A02/MF A01. Order Number DE83007504.

α-Al_2O_3 was prepared and converted into γ-Al_2O_3 by 1000°C calcination; this gamma powder transformed into alpha upon heating at 1200°C. X-ray diffraction lines were compared with ASTM values for α-Al_2O_3. Sintering of γ-Al_2O_3 was studied. Swelling in sintering of MgO-doped Al_2O_3 was also studied. (DLC)

21124 **(DOE/NBM—3007365) Evaluation of advanced materials. Final report.** Wright, I.G.; Clauer, A.H.; Shetty, D.K.; Tucker, T.R.; Stropki, J.T. (Battelle Columbus Labs., OH (USA)). 18 Nov 1982. Contract W-7405-ENG-26. 171p. NTIS, PC A08/MF A01. Order Number DE83007365.

Cemented tungsten carbides with a binder level in the range of 5 to 6 percent exhibited the best resistance to erosion for this class of materials. Other practical cermet materials were diamond - Si/SiC, Al_2O_3-B_4C-Cr, and B_4C-Co. SiAlON exhibited erosion resistance equivalent to the best WC-cermet. The only coating system to show promise of improved erosion resistance was CVD TiB_2 on cemented TiB_2-Ni. Cracking and/or spalling of a TiC coating and a proprietary TMT coating occurred in the standard slurry erosion test. Ranking of cemented tungsten carbide materials in the laboratory erosion test was the same as that found in service in the Wilsonville pilot plant. Specimens from the Fort Lewis pilot plant which performed well in service exhibited low erosion in the laboratory test. A substitute slurry, was found to be 2 to 4 times more erosive than the coal-derived slurry 8 wt% solids. Ranking of materials in the substitute slurry was nearly identical to that in the coal-derived slurry. Three modes of erosion were: ductile cutting; elastic-plastic indentation and fracture; and intergranular fracture. Erosion of a given material was closely related to its microstructure. In the substitute slurry, the angle-dependence of erosion of two forms of SiC, hot-pressed and sintered, were similar, but the sintered material eroded slower. Laser fusing of preplaced powder mixtures can produce cermet-like structures with potential for erosive and sliding wear resistance. TiC particles in Stellite 6 matrix proved less prone to cracking than WC particles in the same matrix. 74 figures, 14 tables.

21125 (LA-UR—83-367) rf plasma synthesis of ultrafine, ultrapure silicon carbide powder. Hollabaugh, C.M.; Hull, D.E.; Newkirk, L.R.; Petrovic, J.J. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 18p. (CONF-830215—2). NTIS, PC A02/MF A01. Order Number DE83007551.

From International conference on ultrastructure processing of ceramics, glasses and composites; Gainesville, FL, USA (14 Feb 1983).

Ultrafine, ultrapure silicon carbide powder has been produced by reaction of silane and methane in a high temperature rf plasma. Preliminary studies include the effect of gas composition and of powder (plasma temperature) on the stoichiometry of the powder. The carbon-to-silicon ratio of the powder was varied from 1.0 to 1.9 by changing the process conditions. The powder has a BET surface area of 101 m^2/g, which is equivalent to a particle diameter of 18.5 nm. A particle size in the range of 10 to 20 nm was measured by transmission electron microscopy. X-ray diffraction results indicate a domain size of 7.5 nm and a crystal structure of beta (cubic) silicon carbide. Spectrographic analysis shows that metallic impurities are lower than high quality grade commercial powder. Because of the high surface area, the powder must be stored and processed in an inert atmosphere to prevent severe contamination with oxygen.

21126 (LBL—15293) Erosion of hard-metal coatings. Levy, A.; Bakker, T.; Sholz, E.; Azadabeh, M. (Lawrence Berkeley Lab., CA (USA)). Oct 1982. Contract AC03-76SF00098. 42p. (CONF-830317—1). NTIS, PC A03/MF A01. Order Number DE83006747.

From TMS/AIME meeting; Atlanta, GA, USA (6 Mar 1983).

The use of protective coatings on components in fossil-fuel energy processes to provide thermal insulation, corrosion resistance and/or wear resistance is becoming more prevalent. In those applications where small, erosive particles occur in the environment, such as in the use of pulverized coal, erosion behavior of the coating becomes an important design consideration. The erosion of several protective, hard-metal-type coatings and monolithic inserts by particles entrained in an air blast has been investigatd. SiC, Si_3N_4, tungsten carbide, and a series of nickel-chromium-boron alloys were tested at room temperature. The materials were fabricated by chemical vapor deposition, flame spraying, plasma-arc spraying, detonation-gun spraying, melting and brazing, and hot pressing. The effects of composition, morphology, method of facrbrication, thickness, and surface texture on erosion behavior are discussed. The mechanisms of erosion for the different materials are defined and compared. It was determined that the materials had a wide range of erosion resistance with the fine-grain-size and minimum-porosity materials having the lowest erosion rates. All of the materials tested eroded in a brittle manner with essentially no relationship to hardness. 19 figures.

21127 Spin correlations in uranium nitride near the ordering temperature. Holden, T.M.; Buyers, W.J.L.; Svensson, E.C.; Lander, G.H. (Atomic Energy of Canada Limited, Chalk River Nuclear Laboratories, Chalk River, Ontario K0J 1J0, Canada). *Physical Review [Section] B: Condensed Matter;* **26**: No. 11, 6227-6238(1 Dec 1982).

The spin correlations in cubic uranium nitride near the Neel temperature have been measured using two-axis and three-axis crystal spectrometer neutron scattering techniques. The spin correlations are found to be longitudinal in character and are spatially anisotropic. A dynamic scaling model is proposed which incorporates the anisotropy and is found to give a good description of the data. The exponents characterizing the temperature dependence of the inverse correlation length and susceptibility are close to those for the two-dimensional Ising model for T>T/sub N/+4 K. The results are interpreted in terms of strong correlations within {001} sheets with weak correlations between sheets.

21128 Role of elemental mercury in the superconductivity of Hg/sub 3-delta/AsF_6. Schirber, J.E.; Heeger, A.J.; Nigrey, P.J. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Physical Review [Section] B: Condensed Matter;* **26**: No. 11, 6291-6293(1 Dec 1982).

Pressure-temperature excursions necessary for conversion of rhombohedral α-Hg to body-centered tetragonal β-Hg have been applied to single crystals of Hg/sub 3-delta/AsF_6. The superconducting properties of the compound near 4 K are shown to track those of elemental α- and β-Hg which appear to be trapped within the sample.

21129 Self-consistent electronic structure of lanthanum dihydride and lanthanum trihydride. Misemer, D.K.; Harmon, B.N. (Ames Laboratory, U. S. Department of Energy and Department of Physics, Iowa State University, Ames, Iowa 50011). *Physical Review [Section] B: Condensed Matter;* **26**: No. 10, 5634-5644(15 Nov 1982).

The electronic structures of lanthanum dihydride and trihydride have been evaluated self-consistently using a semirelativistic Korringa-Kohn-Rostoker method. The results indicate a charge transfer to the tetrahedral hydrogen for the dihydride, but no charge transfer to the additional octahedral hydrogen for the trihydride. The energy gap in the trihydride is found to be greatly reduced from the value obtained from non-self-consistent calculations, but otherwise the effects of self-consistency are minor. The results are discussed together with recent experimental and theoretical studies which have focused on the observed metal-semiconductor phase transition.

21130 Neutron scattering investigation of layer-bending modes in alkali-metal—graphite intercalation compounds. Zabel, H.; Kamitakahara, W.A.; Nicklow, R.M. (Department of Physics and Materials Research Laboratory, University of Illinois at Urbana-Champaign, Urbana, Illinois 61801). *Physical Review [Section] B: Condensed Matter;* **26**: No. 10, 5919-5926(15 Nov 1982).

Phonon dispersion curves for low-frequency transverse modes propagating in the basal plane have been measured in the alkali-metal—graphite intercalation compounds KC_8, CsC_8, KC_{24}, and RbC_{24} by means of neutron spectroscopy. The acoustic branches show an almost quadratic dispersion relation at small q, characteristic of strongly layered materials. The optical branches of stage-1 compounds can be classified as either graphitelike branches showing dispersion, or as almost dispersionless alkali-metal-like modes. Macroscopic shear constants C_{44} and layer-bending moduli have been obtained for the intercalation compounds by analyzing the data in terms of a simple semicontinuum model. In stage-2 compounds, a dramatic softening of the shear constant by about a factor of 8 compared with pure graphite has been observed. Low-temperature results on KC_{24} indicate the opening of a frequency gap near the alkali-metal Brillouin-zone boundary, possibly due to the formation of the alkali-metal superstructure.

21131 Magnetic free energy of $ErRh_4B_4$ in paramagnetic and superconducting states. Behroozi, F.; Carbtree, G.W.; Campbell, S.A.; Snider, D.R.; Schneider, S.; Levy, M. (University of Wiscon-Parkside, Kenosha, Wisconsin and Argonne National Laboratory, Argonne, Illonis). *Journal of Low Temperature Physics;* **49**: No. 1, 73-90(1 Oct 1982).

Magnetization curves for a polycrystalline specimen of $ErRh_4B_4$ are analyzed to estimate the paramagnetic contribution to the Gibbs free energy as well as the differences in free energy between the superconducting and normal states. These results are compared with the theoretical predictions of a suitably constrained model based on Ginzburg-Landau theory for magnetic superconductors.

21132 Shock-induced reactivity enhancement of zirconia powders. Hankey, D.L.; Graham, R.A.; Hammetter, W.F.; Morosin, B. (Sandia National Labs., Albuquerque, NM (USA)). *Journal of Materials Science Letters;* **1**: No. 10, 445-447(Oct 1982).

It is the object of this paper to report on an investigation of shock-induced reactivity enhancement of zirconia powders by measuring the change in the ZrO_2-PbO reaction temperature brought about by controlled high pressure shock wave loading of the ZrO_2. This work is thought to provide the first explicit quantitative measure of shock-enhanced solid state reactivity. The as-received and shock-compressed zirconias were characterized using various methods. Surface area was measured using a BET method and phase analysis was performed by X-ray diffraction. Information on crystalline strain introduced in the shock loading process and crystallite size was also obtained from the diffraction patterns. Thermogravimetric analysis (TGA), thermal evolution analysis (TEA), and optical emission spectrographic analysis were employed to detect the presence of impurities which might have been introduced during the shock compression. Experimental details are presented. The results are reported and discussed.

21133 **Pd/SiO$_2$ II. Effects of pretreatment on structure.** Nandi, R.K. (Northwestern Univ., Evanston, IL); Georgopoulos, P.; Cohen, J.B.; Butt, J.B.; Burwell, R.L. Jr.; Bilderback, D.H. *Journal of Catalysis;* 77: No. 2, 421-431(Oct 1982). Contract AC02-77ER04254.

Experiments employing extended X-ray absorption fine structure and wide-angle X-ray diffraction, at the Cornell University High Energy Synchrotron Source, have shown that Pd catalysts of high percentage metal exposed stored in air consist primarily of crystalline PdO. Reduction of these catalysts in hydrogen results in the formation of palladium, whereas similar treatment of catalysts of low percentage metal exposed leads to palladium hydride.

21134 **Certain experimental observations of the responses of PZT65/35 due to domain switching.** Allensworth, D.L.; Chen, P.J. (Sandia National Labs., Albuquerque, NM). *Ferroelectrics;* 40: 65-70(1982). Contract AC04-76DP00789.

The purpose of this work is to determine experimentally the strains and electric displacements associated with domain switching in PZT65/35. In particular, the polar and lateral strains of an essentially cube specimen, viz., the results corresponding to the butterfly loops are measured independently. The responses of the cube specimen are, of course, three dimensional. Comparison of the polar butterfly loop of the cube specimen to that of a disc specimen whose thickness to diameter ratio is quite small indicates that the responses of the disc specimen are also three dimensional. These results also suggest the presence of surface layer effects which are more prominent in the disc specimen.

21135 **Melting phenomena and laser annealing in semiconductors.** Narayan, J. (Oak Ridge National Lab., TN). *Institute of Physics, Conference Series;* No. 60, 101-112(1981). Contract W-7405-ENG-26.

From Microsc. semicond. mater. conference; Oxford, England (6 April 1981).

The work on annealing of displacement damage, dissolution of boron precipitates, and the broadening of dopant profiles in semiconductors after treating with ruby ($\lambda = 0.649$ μm, tau = 15ns, E = 1.0-2.0 Jcm^{-2}), and dye ($\lambda = 0.485$ μm, tau = 9ns, E = 0.7-1.3 Jcm^{-2}) laser pulses is reviewed in order to provide convincing evidence for the melting phenomenon and illustrate the mechanism associated with laser annealing. The nature of the solid-liquid interface and the interface instability during rapid solidification is considered in detail. It is shown that solute concentrations after pulsed laser annealing can far exceed retrograde maxima values. However, there is a critical solute concentration above which a planar solid-liquid interface becomes unstable and breaks into a cellular structure. The solute concentrations and cell sizes associated with this instability are calculated using a perturbation theory, and compared with experimental results.

3603 Composite Materials

REFER ALSO TO CITATION(S) 21078

21136 **(AGARD-LS—124) Practical considerations of design, fabrication and tests for composite materials.** (Advisory Group for Aerospace Research and Development, 92 - Neuilly-sur-Seine (France)). 1982. 201p. NTIS.

The lectures are directed to the practical application of composites to structures. The scope includes a lecture on design considerations involving material selection, fabrication techniques, and tooling concepts. Stress analysis is covered including knockdown factors, load transfer concepts and analytical techniques. The Lecture Series concludes with a lecture on qualification requirements and practical consideration in inspection and testing techniques. These lectures are not geared to the day-to-day developments at the very forefront of technology, but rather to state-of-the-art concepts, techniques, and materials that when combined will assure a high probability of success in achieving design goals for cost as well as weight savings.

21137 **(N—82-14289) Fracture mechanics in fiber reinforced composite materials, taking as examples B/Al and CFRP.** Peters, P.W.M. (Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt e.V., Koeln (Germany, F.R.)). 1980. 2p. (In German). NTIS, PC A03/MF A01.

In its Colloq. on Composite Mater. 2 p (SEE N82-14289 05-24) REFS.

The validity of linear elastic fracture mechanics and other fracture criteria was investigated with laminates of boron fiber reinforced aluminum (B/Al) and of carbon fiber reinforced epoxide (CFRP). Cracks are assessed by fracture strength Kc or Kmax (critical or maximum value of the stress intensity factor). The Whitney and Nuismer point stress criterium and average stress criterium often show that Kmax of fiber composite materials increases with increasing crack length however, for B/Al and CFRP the curve showing fracture strength as a function of crack length is only applicable in a small domain. For B/Al, the reason is clearly the extension of the plastic zone (or the damage zone in the case of CFRP) which can not be described with a stress intensity factor. (ESA)

21138 **(NASA-CR—159114) Design, fabrication and test of graphite/polyimide composite joints and attachments for advanced aerospace vehicles.** Cushman, J.B. (Boeing Co., Seattle, WA (USA)). Apr 1981. 47p. NTIS, PC A03/MF A01.

NASA. Langley Research Center. REFS.

Standard and advanced bonded joint concepts were evaluated to develop a data base for the design and analysis of advanced composite joints for use at elevated temperatures (561K (550F)). Design concepts for specific joint applications and the fundamental parameters controlling the static strength characteristics of such joints were identified. Test results are presented for rail shear and sandwich beam compression tests and tension tests of moisture conditioned specimens and bonded on T sections. Coefficients of thermal expansion data are presented for A7F (LARC 13 Amide-imide modified) adhesion. Static discriminator test results for type 1 and type 2 bonded and bolted preliminary attachment concepts are presented and discussed.

21139 **(NASA-CR—165051) Analysis of crack propagation as an energy absorption mechanism in metal matrix composites.** Adams, D.F.; Murphy, D.P. (Wyoming Univ., Laramie (USA)). Feb 1981. 159p. NTIS, PC A08/MF A01.

The crack initiation and crack propagation capability was extended to the previously developed generalized plane strain, finite element micromechanics analysis. Also, an axisymmetric analysis was developed, which contains all of the general features of the plane analysis, including elastoplastic material behavior, temperature-dependent material properties, and crack propagation. These analyses were used to generate various example problems demonstrating the inelastic response of, and crack initiation and propagation in, a boron/aluminum composite.

21140 **(NASA-CR—165753) Thermomechanical response of gr/pi composites. Final report, 1 October 1979-30 March 1981.** Rosen, B.W.; Nagarkar, A.P.; Hashin, Z. (Materials Sciences Corp., Blue Bell, PA (USA)). Mar 1981. 93p. NTIS, PC A05/MF A01.

The effects of temperature changes upon the stresses and strains in composite laminates having carbon fibers in a polyimide matrix were evaluated. Composites having laminae in which there were nonlinear stress-strain relations for stresses transverse to the fibers and for axial shear stresses were treated. Material properties were considered to be temperature dependent. Separately, the effects of laminae viscoelastic response were also treated. The results suggest that, for this material, nonlinearities due either to stress or time dependent effects do not appear to be of major practical importance for conventional high temperature composite structures.

21141 **(NASA-TM—82749) Durability/life of fiber composites in hygrothermomechanical environments.** Chamis, C.C.; Sinclair, J.H. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1981. 28p. NTIS, PC A03/MF A01.

Presented at the Sixth Conf. on Composite Mater.: Testing and Design sponsored by the Am. Soc. for Testing and Mater., Phoenix, Ariz., 12-13 May 1981.

Statistical analysis and multiple regression were used to determine and quantify the significant hygrothermomechanical variables which infuence the tensile durability/life (cycle loading, fatigue) of boron-fiber/epoxy-matrix (B/E) and high-modulus-fiber/epoxy-matrix (HMS/E) composites. The use of the multiple regression analysis reduced the variables from fifteen, assumed initially, to six or less with a probability of greater than 0.999. The reduced variables were used to derive predictive models for compression an intralaminar shear durability/life of B/E and HMS/E composites assuming isoparametric fatigue behavior. The predictive models were subsequently generalized to predict the durability/life of graphite-fiber-r generalized model is of simple form, predicts conservative values compared with measured data and should be adequate for use in preliminary designs.

21142 **(NASA-TM—83209) Preliminary analysis of accelerated space flight ionizing radiation testing.** Wilson, J.W. (Old Dominion Univ.); Stock, L.V. (Christopher Newport Coll.). (National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center). Jan 1982. 19p. NTIS, PC A02/MF A01.

REFS.

A preliminary analysis shows that radiation dose equivalent to 30 years in the geosynchronous environment can be accumulated in a typical composite material exposed to space for 2 years or less onboard a spacecraft orbiting from perigee of 300 km out to the peak of the inner electron belt (approximately 2750 km). Future work to determine spacecraft orbits better tailored to materials accelerated testing is indicated. It is predicted that a range of 10 to the 9th power to 10 to the 10th power rads would be accumulated in 3-6 mil thick epoxy/graphite exposed by a test spacecraft orbiting in the inner electron belt. This dose is equivalent to the accumulated dose that this material would be expected to have after 30 years in a geosynchronous orbit. It is anticipated that material specimens would be brought back to Earth after 2 years in the radiation environment so that space radiation effects on materials could be analyzed by laboratory methods.

21143 **(UCRL—88513) Processing, cure reactions, network structure and mechanical properties of TGDDM/DDS epoxies.** Morgan, R.J.; Happe, J.A.; Mones, E.T. (Lawrence Livermore National Lab., CA (USA)). Dec 1982. Contract W-7405-ENG-48. 13p. (CONF-830408—1). NTIS, PC A02/MF A01. Order Number DE83004804.

From 28. national Society for the Advancement of Materials Process Engineers symposium; Anaheim, CA, USA (12 Apr 1983).

Diaminodiphenyl sulfone (DDS) cured tetraglycidyl 4,4′ diaminodiphenyl methane (TGDDM) epoxies are the most-common composite matrices utilized in high-performance fibrous composites. Our recent studies on the characterization of these epoxies from the processing and durability viewpoints are described. The effects of DDS concentration, BF_3:$NH_2C_2H_5$ catalyst composition, TGDDM impurities, and prepreg mixing conditions on the processing of the composite, cure reactions, and the resultant chemical and physical structure of TGDDM-DDS epoxies are presented. 8 figures.

21144 **Transport in simple liquids and dense gases: kinetic mean-field theory and the KAC limit.** Karkheck, J.; Stell, G.; Martina, E. (State Univ. of New York, Stony Brook). pp 150-157 of Proceedings of the eighth symposium on thermophysical properties. Volume 1. Thermophysical properties of fluids. New York, NY; American Society of Mechanical Engineers (1982).

Maximization of entropy is used in conjunction with the BBGKY hierarchy to obtain a closed one-particle kinetic equation. For an interparticle potential of hard-sphere core plus smooth attractive tail, this equation contains a hard-core collision integral, identical to that of the revised Enskog theory, plus a mean-field term which is linear in the tail strength. The thermodynamics contained therein leads directly to the now-standard statistical-mechanical methods to construct a state-dependent effective hard-core potential in relation to a more realistic potential. These methods induce an extension of the transport coefficients to the Lennard-Jones potential. Predictions of the resulting transport theory compare very favorably with thermal conductivity and shear viscosity experimental results for real simple liquids and dense gases, and also with molecular dynamics simulation results. Poor agreement between theory and experiment is found for moderately dense and dilute gases. The kinetic theory also contains an entropy functional and an H-theorem is proven. Extension to mixtures is straightforward and the Kac-limit is discussed in detail.

3604 Polymers And Plastics

REFER ALSO TO CITATION(S) 19900, 19977, 20582, 20587, 20592, 21060, 21077, 21248, 21276, 21277

21145 **(DOE/ER/10922—2) Microstructural analysis of ion-containing polymers. Progress report, January 1-December 31, 1982.** Cooper, S.L. (Wisconsin Univ., Madison (USA). Dept. of Chemical Engineering). Feb 1983. Contract AC02-81ER10922. 24p. NTIS, PC A02/MF A01. Order Number DE83008080.

The authors' proposed explanation of the small-angle x-ray scattering of ionomers was compared to the depleted zone core-shell model in its ability to fit the data for the sulfonated polystyrene ionomers. The new model, which attributes the scattering peak to inter-aggregate interference is superior in several respects and the resulting parameters are reasonable and consistent with the known compositions of the samples. The examination of the local ionic aggregate structure by extended x-ray-absorption fine-structure spectroscopy has indicated a number of differences among ionomer systems. Although transition-metal cations are universally surrounded by a well-ordered coordination sphere of oxygen atoms, the alkali-metal cations exhibit no such structure. In the well-dried sulfonated polystyrene and Surlyn samples, a second shell is observed which is probably due to sulfur and carbon atoms in the two materials, respectively. Such a structure is never observed in the Nafions, although under certain conditions, a second shell of neighboring cations is observed. 4 figures, 5 tables.

21146 **Time-dependent small-angle x-ray scattering from stress-induced crazes in polymers.** Rothwell, W.S; Martinson, R.H.; Gorman, R.L. (Lockheed Palo Alto Research Laboratory, 3251 Hanover Street, Palo Alto, California 94304). *Applied Physics Letters;* **42**: No. 5, 422-424(1 Mar 1983).

High-intensity x radiation from the Stanford Synchrotron Radiation Laboratory storage ring has been used in a small-angle scattering mode to study dynamic deformation behavior in polymers. Complete scattering curves were obtained as a function of time during relaxation with the strain direction oriented parallel and perpendicular to the plane of measurement. Interpretation is made of the resulting information on relative number, size, and time dependence of heterogeneities. A tentative model proposes that the application of stress starts a rapid creation of approximately uniform spherical voids which migrate and coalesce to form crazes and relieve the stress.

3606 Other Materials

REFER ALSO TO CITATION(S) 19800, 19817, 19916, 19993, 19994, 19995, 19996, 19997, 20694, 20877, 21086, 21099, 21105, 21434, 21570, 21623

21147 **(AD-A—110508) InP materials.** Iseler, G.W. (Massachusetts Inst. of Tech., Lexington (USA). Lincoln Lab.). Sep 1981. 28p. NTIS, PC A03/MF A01.

REFS.

The improvement of the yield of high purity polycrystalline InP as source material for crystal growth and the optimization of the liquid encapsulated Czochralski (LEC) method to grow crystals with low dislocation density and uniform dopant concentration was undertaken. Reproducible twin free growth in the lower gradient by modifying the pulling rod and its rotation mechanism to reduce system vibration was obtained. An X-ray topography and CO_2 laser transmission show that doped LEC crystals contain prominant growth striations, probably produced by random convection currents in the melt, that are associated with abrupt changes in dopant concentration. Infrared transmission at 10.6 microns was measured on p-type InP samples to determine the free carrier absorption due to holes. It is found that the absorption cross section is much higher for holes than for electrons.

21148 **(AD-A—120156/5) Potential for high temperature superconductivity. Final report Apr 80-Oct 81.** Reynolds, D.C.; Chung, Y.; Nam, S.B. (Air Force Wright Aeronautical Labs., Wright-Patterson AFB, OH (USA)). Jul 1982. 39p. (AFWAL-TR—82-1031). NTIS, PC A03/MF A01.

The investigation of Cu Cl at high pressure revealed magnetic anomalies that were characteristic of a superconducting state. Subsequent to these investigations similar effects were observed in pressure quenched CdS. These preliminary results were very promising, though considerably more work was required to confirm the mechanism as well as to gain a better understanding of the materials that exhibit the desired properties. In view of these observations an LDF program was initiated, the goal of which was to reproduce some of the magnetic anomalies and to try to understand something of the mechanism as well as what properties the materials needed to demonstrate the effect. The initial investigations were very devoted to Cu Cl since more was known about the high temperature diamagnetic anomaly in this material than any other material. Pressure cells were constructed and a variable temperature Dewar was obtained so the magnetic properties could be investigated over a temperature to liquid helium temperature. The necessary equipment was assembled to measure the diamagnetic and paramagnetic susceptibilities. Cu Cl crystals were grown from the melt from the vapor phase and by a flux technique. The first experiments that were done were optical experiments designed to characterize the starting material as well as to obtain information relating to the material properties that might relate to the mechanisms involved. From high resolution emission experiments a center was observed that could be then center from which the superconducting electrons are supplied as predicted by theory. Studies were made on pressure quenched CdS where both diamagnetic and paramagnetic anomalies were observed.

21149 **(ANL/NESC—267R) WATER; steam tables at 14.5-14,500 psia and 32-472°F.** Coffman, W.A.; Lynn, L.L. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048267.

The largest errors for enthalpy, specific heat, specific volume, and thermal conductivity occur near the saturation curve, especially near the critical point. The largest error in viscosity occurs at low temperatures .

WATER is a subroutine used to extract thermodynamic and transport properties of liquid, vapor, and supercritical water by tabular interpolation over the range of states: 14.5 to 14,500 psia and 32 to 1472 degrees F. These properties are specific volume, specific enthalpy, dynamic viscosity, and thermal conductivity, tabulated for pressure and temperature conditions.CDC6600; FORTRAN IV; BKSB; The storage required for the property data is 2877 locations. Total storage requirement is about 4000 locations. There are no tape requirements.

21150 **(ANL/NESC—294R) M0899;hoh; steam tables 14.5-2538 psia.** Lynn, L.L. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048294.

By making calls on a subroutine called HOH, M0899 edits thermodynamic and transport properties of water over the range 14.5 to 2538 psia and up to 608 degrees Fahrenheit below saturation and 932 degrees Fahrenheit above saturation.CDC6600; FORTRAN IV; SCOPE 2.0; On the CDC6600 a FORTRAN IV compiler plus about 3000 storage locations for subroutine HOH and 10,000 locations for the main program.

21151 **(ANL/NESC—300) SAFE-CREEP; viscoelastic analysis of concrete.** De Arriaga, F. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048300.

SAFE-CREEP performs a viscoelastic analysis of plane or axisymmetric composite concrete structures with age- and temperature-dependent creep data.UNIVAC1108; FORTRAN IV; 65K memory and 13 tapes.

21152 **(ANL/NESC—396R) WASP2; water properties for safety analysis.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy, J.H.; Feher, T.R. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048396.

The WASP2 procedures are restricted to be within a pressure range from below atmospheric to near critical for saturation states and for single phase vapor, and to over 10,000 psia for single phase liquid. The temperature range is approximately 40 degrees F to 650 degrees F for the liquid and from saturation temperature to approximately 2200 degrees F for the vapor region.

WASP2 is a FORTRAN IV computer program which performs a spline function fit to data obtained from the WASP subprogram (see reference 1) for thermodynamic and transport properties of water and steam. The properties calculated by WASP2 are: pressure and temperature as functions of specific volume and specific internal energy; specific volume as a function of pressure and enthalpy; and viscosity, thermal conductivity, and specific heat as functions of pressure and temperature.CDC6600,7600; FORTRAN IV; SCOPE 3.3 (CDC6600), SCOPE 1.1 (CDC7600); The WASP2 procedure requires 200,000 (octal) words of CDC7600 large core memory (LCM) for storing the coefficients for the spline functional fit of the water and steam surfaces..

21153 **(ANL/NESC—869) THERPP; thermodynamic properties hydrocarbons.** Deeds, R.S. (EG and G Idaho, Inc., Idaho Falls (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048869.

With its current dimensioning, THERPP can handle grid sizes up to 30x30, for mixtures containing up to 15 components. Fluids for which the program has been tested are methane, ethane, propane, isobutane, n-butane, isopentane, n-pentane, n-heptane, n-octane, ethylene, propylene, nitrogen, carbon dioxide and hydrogen sulfide. .

THERPP computes thermodynamic properties of light hydrocarbons and mixtures of light hydrocarbons. Properties can be generated in the form of either a pressure-temperature grid or a pressure-enthalpy grid.CDC7600;IBM360,370,303x; FORTRAN IV; SCOPE 2.1 (CDC7600), OS/360 (IBM360), OS/370 (IBM370,303x); 36,000 (octal) words of memory are necessary for execution of the CDC7600 version and 155K bytes for execution of the IBM360 version. The IBM and CDC conversion programs require 45K bytes and 5,000 (octal) words of memory, respectively.

21154 **(ANL/NESC—886) EQ3/6; chemical equilibrium of aqueous systems.** Wolery, T.J. (Lawrence Livermore National Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048886.

Calculations are allowed in the temperature interval 0-350 degrees C, at either 1 atm-steam saturation pressures or a constant

500 bars. The activity coefficient approximations for aqueous solutes limit modeling to solutions of ionic strength less than about one molal.

The EQ3/6 version .2055U software computes thermodynamic equilibrium models for aqueous solution-mineral systems. It consists of two main programs, EQ3 and EQ6. EQ3 performs distribution-of-species calculations for natural water compositions; EQ6 uses the results of EQ3 to predict the consequences of heating and cooling aqueous solutions and of irreversible reaction in rock-water systems. The programs can be used to study such phenomena as the formation of ore bodies, scaling and plugging in geothermal development, and the long-term disposal of nuclear waste.CDC7600;CRAY1; FORTRAN Extended 4.6 (CDC7600) and CFT (CRAY1); SCOPE 2 (CDC7600); About 45,000 (octal) words of SCM and 58,000 (octal) words of LCM are required on a CDC7600 for EQ3, about 125,000 (octal) words of SCM and 32,000 (octal) words of LCM for EQ6. Four units in addition to the standard input/output units are used by EQ3, ten units in addition to the standard I/O units by EQ6.

21155 (BDX—613-2713) Nontoxic polyimides. Final report. Jamieson, D.R. (Bendix Corp., Kansas City, MO (USA)). Jan 1983. Contract AC04-76DP00613. 32p. NTIS, PC A03/MF A01. Order Number DE83006933.

A unique bismaleimide resin, termed APO-BMI, used as a binder in the fabrication of syntactic foam parts, was developed using nontoxic raw materials. APO-BMI may be used in compression molding and mold-to-size applications. 7 figures, 7 tables.

21156 (CONF-821107—50) Mechanical stability of a Cm-doped celsian glass-ceramic. Roubort, J.L.; Offermann, P.; Matzke, H. (Commission of the European Communities, Karlsruhe (Germany, F.R.). European Inst. for Transuranium Elements; Hahn-Meitner-Institut fuer Kernforschung Berlin G.m.b.H. (Germany, F.R.)). Oct 1982. Contract W-31-109-ENG-38. 9p. NTIS, PC A02. Order Number DE83007862.

From 6. international symposium on the scientific basis for radioactive waste management; Boston, MA, USA (1 Nov 1982).

The Hertzian indentation technique has been used to measure the fracture properties of a celsian glass-ceramic (B1-3) developed for high-level waste storage. For spherical glass indentors of radii, $R \leqq 5$ mm the load required to form ring cracks is proportional to R and intersects the origin, confirming Auerbach's law. The measurements are analyzed and result in a fracture toughness, K/sub IC/ = 1.3 MNm/sup -3/2/. For $R > 5$ mm flaw statistics cause a deviation from the ideal behavior of Auerbach's law. Spontaneous failure due to radiation was not observed, on the contrary, the self-radiation damage caused by recoiling Pu atoms resulting from α-decay of a ^{244}Cm doped sample to a dose of about 1.5 x 10^{19} α-decays/cm^3 increases K/sub IC/ by at least 25%. This increase in toughness is probably caused by the internal stresses which result from disordering due to the radiation damage. This is confirmed by the broadening of the x-ray spectra as the result of self-radiation. Annealing a damaged sample at high temperatures produces fracture presumably by the coalescence of helium bubbles.

21157 (CONF-8107103—1) ^{127}I Moessbauer study of Chevrel-phase superconductors $Mo_6X_6I_2$ (X = S,Te). Subba Rao, G.V.; Niarchos, D.; Shenoy, G.K.; Cashion, J.D.; Hinks, D.; Umarji, A.M.; Janaki, S. (Argonne National Lab., IL (USA); Indian Inst. of Tech., Madras). 1981. Contract W-31-109-ENG-38. 12p. NTIS, PC A02/MF A01. Order Number DE83007593.

From International conference on the applied Mossbauer spectroscopy; Kashmir, India (13 Jul 1981).

The Chevrel-phase compounds $Mo_6X_6I_2$ (X = S,Te) exhibit very interesting superconducting behvior. The transition temperatures dramatically increase in both Mo_6X_8 structures be replacing 2 of the X atoms with iodine atoms. This enhancement in superconducting behavior is closely related to the number of electrons on the Mo_6 cluster in these compounds. The iodine atoms in these compounds preferentially occupy the 2c sites while the remaining X atoms occupy the 6f sites. We have performed the Moessbauer effect measurements using the 57.6-keV transition in ^{127}I to evaluate the charge on the iodine. Assuming the charge on S to be -2, the experimental value of nearly -1 charge on iodine leaves 22.3 electrons per Mo_6 cluster which is close to that predicted in $SnMo_6S_8$). In $Mo_6Te_6I_2$, assuming Te to have nearly -1 charge, we obtain 28.3 electrons per Mo_6 cluster. The observation of superconductivity in this compound then reflects a significantly distinct band structure of tellurides compared to those of sulphides. The quadrupole interactions at the odine nucleus in $Mo_6S_6I_2$ and $Mo_6Te_6I_2$ are small but have opposite signs signifying bonding differences between these compounds.

21158 (DOE/ER/10390—5) Investigation of deep level defects in epitaxial semiconducting. Progress report, June 15, 1982-June 14, 1983. Wessels, B.W. (Northwestern Univ., Evanston, IL (USA)). 15 Feb 1983. Contract AC02-79ER10390. 72p. NTIS, PC A04/MF A01. Order Number DE83007523.

Optical deep level transient spectrosopy (DLTS) on doped, undoped and irradiated ZnSe was performed. Doping of ZnSe with nitrogen resulted in the formation of relatively shallow acceptor states as determined by DLTS. This is the first direct electrical evidence for shallow acceptor states in ZnSe. N-n heterojunctions fabricated from the ZnSe/GaAs epitaxial layers had built-in voltages different from the theoretically predicted values.

21159 (DOE/ER/10438—7) Study of the formation of surface films: critical conditions for growth. Progress report, June 1, 1982-May 31, 1983. Smith, F.W. (City Coll., New York (USA). Dept. of Physics). Jan 1983. Contract AC02-79ER10438. 9p. NTIS, PC A02/MF A01. Order Number DE83005821.

Significant results obtained during the last year (January to December 1982) from our experimental study of the critical conditions for the growth of surface films on silicon and on tantalum are presented. The study of the oxidation of the Si(111) and (100) surfaces using H_2O as oxidant have been essentially completed. Significant progress has been made on a study of the enhancement of the oxidation of silicon at high substrate doping levels. We are working on a theoretical model to explain these results. In addition, preliminary results have been obtained on the interaction of H_2O with polycrystalline Ta foils.

21160 (DOE/ER/10444—6) Infrared-absorption spectrum of free carriers in polar semiconductors. Progress report, July 1, 1982-June 30, 1983. Jensen, B. (Boston Univ., MA (USA)). Jan 1983. Contract AC02-79ER10444. 16p. NTIS, PC A02/MF A01. Order Number DE83007975.

An analytical expression for the real part of the refractive index n near the fundamental absorption edge has been calculated for a semiconductor in terms of experimentally known quantities. It is derived from a quantum-mechanical claculation of the complex dielectric constant which assumes the band structure of the Kane theory. The expression obtained is a function of band-gap energy, effective electron and heavy hole masses, the spin-orbit splitting energy, the lattice constant, and the carrier concentration for n-type or p-type materials. The refractive index at the absorption edge is found as a function of the material parameters above. This enables one to express theoretical results in terms of basic material parameters only, with no adjustable constants. The dispersion near the fundamental absorption edge which has been observed experimentally for a number of III-V and II-VI compounds is predicted and its calculation enabled. This is expected to have applications for designing in areas such as integrated optics, where the optical functions of light generation, guiding, coupling, modulation, and detection must be obtainable in a single semiconductor material and depend on a knowledge of the refractive index. Comparison of theory with available experimental data is given for a number of III-V and II-VI binary compounds. The extension to ternary and quaternary materials is discussed.

21161 (DOE/ER/10444—7) Dispersion of the refractive index near the absorption edge in compound semiconductors. Jensen, B.; Torabi, A. (Boston Univ., MA (USA). Dept. of Physics). 1982. Contract AC02-79ER10444. 17p. (CONF-821170—1). NTIS, PC A02/MF A01. Order Number DE83007501.

From Conference on laser induced damage in optical materials; Boulder, CO, USA (15 Nov 1982).

An analytical expression for the real part of the refractive index n near the fundamental absorption edge has been calculated for a semiconductor in terms of experimentally known quantities. It is derived from a quantum mechanical calculation of the complex dielectric constant which assumes the band structure of the Kane theory. The expression obtained is a function of band gap energy, effective electron and heavy hole masses, the spin orbit splitting energy, the lattice constant, and the carrier concentration for n-type or p-type materials. The refractive index is given as a function of frequency and the basic material parameters listed above with no adjustable constants. Dispersion near the fundamental absorption edge, which has been observed experimentally for a number of III-V and II-VI compounds, is predicted and its calculation enabled. Comparison of theory with available experimental data is given.

21162 (DOE/ER/13004—1) Light-scattering studies of lower-dimensional colloidal-particle and critical-fluid systems. Progress report, August 1, 1982-July 31, 1983. O'Sullivan, W.J.; Mockler, R.C. (Colorado Univ., Boulder (USA)). Feb 1983. Contract AC02-82ER13004. 11p. NTIS, PC A02/MF A01. Order Number DE83007420.

We have extended the theoretical description of the lattice excitations in crystals formed of charged colloidal particle suspensions (CCPS) to include the effects of bounding surfaces. One of the new features that arises in a CCPS crystal confined by surfaces to form a film, is that propagating lattice waves cannot exist at the center of the Brillouin zone. Techniques have been developed to form systems of colloidal particles in monolayers on a water surface and on membranes. Transitions from gas to liquid to two dimensional solid phases have been observed in both classes of system. The two dimensional solid phases range from single crystals having a hexagonal lattice with long range translational order, to hexatic forms with short range translational order and long range orientation order, to amorphous or glass-like of /sub 2,6/lutidine + water have been extended to a film of thickness 0.5 μm. The dynamical critical behavior of this film remains strictly three dimensional to within 2 mK of the extrapolated critical point, where an apparent first order transition occurs.

21163 (N—8228445) Ion beam sputter deposited diamond like films. Banks, B.A.; Rutledge, S.K. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1982. 18p. (NASA-TM—82873; E—1249). NTIS, PC A02/MF A01.

A single argon ion beam source was used to sputter deposit carbon films on fused silica, copper, and tantalum substrates under conditions of sputter deposition alone and sputter deposition combined with simultaneous argon ion bombardment. Simultaneously deposited and ion bombarded carbon films were prepared under conditions of carbon atom removal to arival ratios of 0, 0.036, and 0.71. Deposition and etch rates were measured for films on fused silica substrates. Resulting characteristics of the deposited films are: electrical resistivity of densities of 2.1 gm/cu cm for sputter deposited films and 2.2 gm/cu cm for simultaneously sputter deposited and Ar ion bombarded films. For films approximately 1700 A thick deposited by either process and at 5550 A wavelength light the reflectance was 0.2, the absorptance was 0.7, the absorption coefficient was 67,000 cm to the -1 and the transmittance was 0.1.

21164 (NASA-CASE-NPO—15530-1) A method of increasing minority carrier lifetime in silicon web or the like. Liu, J.K.; Schwuttke, G.H.; Koliwad, K.M. (Jet Propulsion Lab., Pasadena, CA (USA)). Mar 1982. 10p. NTIS, PC A02/MF A01.

A silicon dendrite is grown as a ribbon forming two silicon layers which are separated by an interface layer which contains a certain large number of defects. Significant increase of minority carrier lifetime with homogeneous distribution at the outer surfaces of the two silicon crystal layers are achieved by processing the web in an atmosphere of a selected gas, e.g., oxygen, nitrogen, or an inert gas, for about 30 minutes to several hours, at a temperature preferably on the order of 900 to 1200 C.

21165 (PNL-SA—8737) MCC-1: a standard leach test for nuclear waste forms. Strachan, D.M.; Turcotte, R.P.; Barnes, B.O. (Pacific Northwest Lab., Richland, WA (USA)). May 1981. Contract AC06-76RL01830. 16p. (CONF-800987—4). NTIS, PC A02/MF A01. Order Number DE83002695.

From Workshop on comparative leaching behavior of radioactive waste forms; Argonne, IL, USA (3 Sep 1980).

A Materials Characterization Center has been established by the Department of Energy at the Pacific Northwest Laboratory. This paper briefly describes five proposed standard leach tests and describes typical results using the MCC-1 static test. For the borosilicate glass studied (PNL-76-68), five-fold replicate experiments show that errors in elemental leach values are usually less than +-10%. Regular time dependent leach curves are obtained, and no significant difference is observed between pure water and simulated silicate/bicarbonate groundwater results. Leaching in salt brine is quite different, especially as shown by elemental depth profiles in the solid which show significant Mg penetration into the gel layer from the brine solution.

21166 (SAND—82-2810C) Electronic properties of superlattices. Osbourn, G.C. (Sandia National Labs., Albuquerque, NM (USA)). 1982. Contract AC04-76DP00789. 20p. (CONF-821219—3). NTIS, PC A02/MF A01. Order Number DE83003709.

From International conference on metastable and modulated semiconductor structures; Pasadena, CA, USA (6 Dec 1982).

The electronic properties of semiconductor superlattices can be intentionally varied by changing their quantum well structures, i.e., by changing their layer thicknesses and their layer alloy compositions. New flexibility in varying superlattice electronic properties occurs in strained-layer superlattices, since lattice-mismatched materials can be used for the individual layers. The flexible choice of layer materials and layer thicknesses in strained-layer superlattices makes possible the tailoring of various superlattice electronic properties to desired values. Calculated values for several adjustable material properties in ternary strained-layer superlattices are presented to illustrate this tailorability. The potential advantages of new types of superlattices with more complicated unit cells are also discussed.

21167 (SAND—82-2986C) Melt depth and regrowth kinetics in pulsed laser annealing of silicon and gallium arsenide. Galvin, G.J.; Thompson, M.O.; Mayer, J.W.; Peercy, P.S.; Hammond, R.B. (Sandia National Labs., Albuquerque, NM (USA); Cornell Univ., Ithaca, NY (USA). Dept. of Materials Science; Los Alamos National Lab., NM (USA)). 1983. Contract AC04-76DP00789. 6p. (CONF-830123—1). NTIS, PC A02/MF A01. Order Number DE83005192.

From SPIE meeting on laser processing of semiconductor devices; Los Angeles, CA, USA (1 Jan 1983).

High-intensity pulsed laser irradiation of semiconductor materials results in ultrafast melting and resolidification of a thin surface layer. An experimental probe has been developed based on the discontinuous change in electrical conductivity of a semiconductor material upon melting. Real time monitoring of the dynamics of pulsed laser melting and resolidification can be obtained by transient electrical conductance measurements. Melting velocities from 5 to 200 m/s and resolidification velocities of 1 to 20 m/s have been observed in silicon with this technique. Simultaneous measurement of the optical reflectance provides additional complementary information on laser melting dynamics. Data from both electrical conductance and optical reflectance measurements is presented for silicon and gallium arsenide. The real time experimental data provide strong evidence for a simple thermal model for melting and resolidification during nanosecond pulsed laser annealing. 9 figures.

21168 (SAND—83-1098C) Relationships between the sol-to-gel and gel-to-glass conversions. Brinker, C.J.; Scherer, G.W. (Sandia National Labs., Albuquerque, NM (USA); Corning Glass Works, NY (USA)). 1983. 32p. (CONF-830215—1). NTIS, PC A03/MF A01. Order Number DE83007032.

From International conference on ultrastructure processing of ceramics, glasses and composites; Gainesville, FL, USA (14 Feb 1983).

Multicomponent gels were prepared with a wide range of pH- water combinations so that the skeletal structure of the desiccated gels varied from being less highly (low pH, low H_2O) to more highly (high pH, high H_2O) polymerized. The apparent value of isothermal viscosity, determined by isothermal shrinkage experiments, was found to increase with time, presumably due to polymerization and structural relaxation of the skeletal framework. This increase was dramatic (>200X) for less highly polymerized gels but was found to occur in all cases, and it therefore is predicted to be a general property of metal alkoxide-derived gels.

21169 (UCID—19684) Equation of state data of APC 2.5. Mitchell, A.C.; Nellis, W.J.; Trainor, R.J. (Lawrence Livermore National Lab., CA (USA)). 7 Feb 1983. Contract W-7405-ENG-48. 13p. NTIS, PC A02/MF A01. Order Number DE83002170.

Equation of state measurements have been made on APC 2.5 to a pressure of 124 GPa (1.24 Mbar). The data include single- and double-shock Hugoniot measurements, ultrasonic properties, and chemical analysis. 3 tables, 2 figures.

21170 Transient photoconductivity studies of the light soaked state of hydrogenated amorphous silicon. Street, R.A. (Xerox Palo Alto Research Center, Palo Alto, California 94304). *Applied Physics Letters;* **42**: No. 6, 507-509(15 Mar 1983). Contract AC02-77CH00178.

Studies of transient photoconductivity show that the primary effect of light soaking in hydrogenated amorphous silicon is to introduce dangling bonds of bulk density 10^{16}—10^{17} cm^{-3}. Light soaking reduces the μtau product of both electrons and holes to values which are quantitatively related to the observed increase in the dangling bond electron spin resonance (ESR) spin density. In addition, no change in the carrier drift mobilities is detected after light soaking.

21171 Laser-controlled etching of chromium-doped <100> GaAs. Tisone, G.C.; Johnson, A.W. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Applied Physics Letters;* **42**: No. 6, 530-532(15 Mar 1983). Contract AC04-76DP00789.

The photocontrolled etching of <100> Cr:GaAs in HNO_3 is examined in the wavelength region of 334—514 nm with an Ar ion laser. The etching rate decreases with increasing wavelength and correlates with the optical absorption coefficient in the GaAs. The etching process is found to be photochemically and not thermally controlled. Etch rates for the UV are 30(μ/s)/(MW/cm²) for laser intensities between 3 and 80 kW/cm².

21172 Melt dynamics of silicon-on-sapphire during pulsed laser annealing. Thompson, M.O.; Galvin, G.J.; Mayer, J.W.; Peercy, P.S.; Hammond, R.B. (Department of Material Science, Cornell University, Ithaca, New York 14853). *Applied Physics Letters;* **42**: No. 5, 445-447(1 Mar 1983). Contract AC04-76DP00789.

Transient electrical conductance measurements have been made on 0.45-μm silicon-on-sapphire during pulsed laser annealing with 25-ns ruby irradiation. The photoconductive contribution to the transient current was sufficiently small that the entire melt and resolidification process could be directly observed. The technique yields quantitative measures of melt depths, melting velocities (5—13 m/s), and solidification velocities (2.8—3.3 m/s). Combined with the complementary techniques of time-resolved reflectivity, energy transmission, and calorimetric energy absorption, transient conductance provides a powerful new diagnostic for investigating melt dynamics.

21173 Flame annealing of arsenic and boron implanted silicon. Narayan, J.; Young, R.T. (Solid State Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Applied Physics Letters;* **42**: No. 5, 466-468(1 Mar 1983). Contract W-7405-ENG-26.

We have investigated the characteristics of flame annealing of ion implantation damage in (100) and (111) silicon substrates using transmission electron microscopy and Van der Pauw measurements. The temperature of the hydrogen flame ranged from 1050 to 1200 °C and the interaction time from 5 to 10 s. Transmission electron microscopy studies showed that a "defect-free" annealing could be achieved with concomitant full electrical activation of dopants. The Hall mobility of flame annealed specimens was found to be comparable to pulsed laser annealed specimens.

21174 Submicron multifilamentary high performance Nb_3Sn produced by powder metallurgy processing of large powders. Otubo, J.; Pourrahimi, S.; Zhang, H.; Thieme, C.L.H.; Foner, S. (Francis Bitter National Magnet Laboratory and Plasma Fusion Center, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Applied Physics Letters;* **42**: No. 5, 469-471(1 Mar 1983).

Powder metallurgy processed submicron multifilamentary Nb_3Sn superconducting wires were fabricated starting with 250—500-μm-diam powders. A multiple strand bundling procedure was used to simulate large scale production with actual areal reductions greater than 10^6 to achieve submicron fibers. Both external tin and tin core processing were successful. Typical Cu-36 wt.% Nb-Sn materials gave overall critical current densities of 8×10^4 A/cm² at 12 T, 3×10^4 A/cm² at 14 T, and 6×10^3 A/cm² at 16 T. These results demonstrate that particle size and billet size can be scaled from earlier laboratory scale to large scale fabrication to produce high performance materials.

21175 Electron spin echo envelope modulation study of lithium nuclear hyperfine and quadrupole coupling in the A(Ti—Li) center of α-quartz. Isoya, J.; Bowman, M.K.; Norris, J.R.; Weil, J.A. (Department of Chemistry, University of Saskatchewan, Saskatoon, Saskatchewan, S7N 0W0 Canada). *Journal of Chemical Physics;* **78**: No. 4, 1735-1746(15 Feb 1983).

Computerized microwave pulse generation and detection with subsequent Fourier transformation of electron spin echo envelope modulation spectra has been used to measure the small /sup 6,7/Li nuclear superhyperfine and quadrupole splittings of a lithium-compensated titanium(3+) center in single crystal α-quartz. Comparison of the ^{7}Li hyperfine matrices A-bar determined from standard cw-EPR and from ESEEM show excellent agreement. The precision is better by an order of magnitude for the latter, with uncertainties on the order of one part in a thousand. Use of a three-dimensional display technique yielded the relative sign of matrices A-bar and Q-bar for ^{7}Li.

21176 (UCRL-Trans—11817) Laser phosphate glasses. Alekseev, N.E.; Gapontsev, V.P.; Zhabotinskii, M.E.; Kravchenko, V.B.; Rudnitskii, Yu.P. (Lawrence Livermore National Lab., CA (USA)). Jan 1983. Contract W-7405-ENG-48. Translation of Lazernye fosfatnye stekla; Izdatel'stvo, Nauka, Moscow, USSR, 1980. (VAAP/SA—82/35). 476p. NTIS, PC A21/MF A01. Order Number DE83007517.

This book gives a detailed description of the physical properties of effective new laser materials - phosphate glasses doped with rare-earth ions, and demonstrates the possibilities and prospects for their use in various types of lasers. Data are presented on the structure of phosphate glasses, and on the spectral-fluorescence, lasing, thermooptical, and nonlinear optical characteristics of laser phosphate glasses doped with Nd^{3+} ions. The book examines processes of energy transfer and fluorescence quenching in phosphate glasses, and the sensitization of fluorescence in glasses coactivated (codoped) with Nd^{3+}-Yb^{3+} and Yb^{3+}-Er^{3+} ions. There are 113 figures, 47 tables, and 545 bibliographic entries.

21177 Larson et al. respond:. Larson, B.C.; White, C.W.; Noggle, T.S.; Mills, D.M. (Solid State Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Physical Review Letters;* **49**: No. 24, 1799(13 Dec 1982).

A reply to the comment on synchrotron x-ray diffraction study of silicon during pulsed-laser annealing is presented.(AIP)

21178 Spin dynamics of a model singlet ground-state system. Youngblood, R.W.; Aeppli, G.; Axe, J.D.; Griffin, J.A. (Brookhaven National Laboratory, Upton, New York 11973). *Physical Review Letters;* **49**: No. 23, 1724-1727(6 Dec 1982). Contract AC02-76CH00016.

Inelastic neutron scattering has been used to study the spin dynamics of LiTb/sub p/Y/sub 1-p/F_4, an induced-moment ferromagnet in which the lowest crystal-field levels of the Tb^{3+} ions are two singlets. For p = 0.38, magnetic excitons are observed which obey the dispersion relation given by mean-field theory. In addition, there is a resolution-limited peak at zero energy transfer which is not accounted for within conventional mean-field theory. For p = 0.97, this central peak is also observed, but no magnetic excitons are seen.

21179 Magnetic-resonance investigation of the ordering in randomly-site-diluted antiferromagnets: $KMnF_3$:Mg. D'Ariano, G.; Borsa, F. (Istituto di Fisica dell'Universita e Gruppo Nazionale di Struttura della Materia del Consiglio Nazionale delle Ricerche, 27100 Pavia, Italy). *Physical Review* [*Section*] *B: Condensed Matter;* **26**: No. 11, 6215-6226(1 Dec 1982). Contract W-7405-ENG-82.

Measurements of ^{19}F NMR in a series of polycrystalline mixed paramagnetic compounds KMn/sub x/Mg/sub 1-x/F_3 with x varying over the whole concentration range have been performed as a function of temperature. The paramagnetic shift and the linewidth and relaxation time of the three NMR lines corresponding to those distinct classes of ^{19}F nuclei that have different numbers of nearest-neighbor magnetic ions were measured as the temperature approaches the transition temperature. The paramagnetic shifts of fluorine nuclei having one and two nearest-neighbor Mn ions compare well with the predictions of a simple random-molecular-field (RMFA) approach. It is shown that the substitution of Mn with Mg modifies locally the nuclear-electron transferred hfs interaction by about 20%. The linewidth of the two lines increases drastically as T/sub N/ is approached. The attempt to explain the data by utilizing Moriya's theory rescaled in the RMFA framework fails completely, indicating that the dynamic effects should be treated in real space. The antiferromagnetic ordering was monitored by measuring the rf susceptibility in zero external magnetic field. It is found that the antiferromagnetic transition is broadened by the concentration gradients present in the samples. The average transition temperature was determined as a function of the average concentration, and the results are compared with the theoretical predictions of recent calculations. Good agreement is found if one takes into account the concentration dependence of the exchange coupling constant.

21180 Shear modulus measurements on classical monolayer systems. Abraham, B.M.; Miyano, K.; Xu, S.Q.; Ketterson, J.B. (Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review Letters;* **49**: No. 22, 1643-1646(29 Nov 1982).

The responses to shear of monomolecular films of stearyl alcohol ($C_{18}H_{37}OH$) and nonadecanoic acid ($C_{18}H_{37}COOH$) spread on water were studied as a function of density. A static shear modulus appears at a phase transition, previously assigned as the liquid-solid transition. The value of the modulus, however, is several orders of magnitude lower than the Kosterlitz-Thouless prediction.

21181 Auger line-shape analysis of the structure of hydrogenated amorphous silicon. Zajac, G.; Bader, S.D. (Materials Science Division, Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review* [*Section*] *B: Condensed Matter;* **26**: No. 10, 5688-5693(15 Nov 1982). Contract W-31-109-ENG-38.

Calculated Si $L_{23}VV$ Auger line shapes are presented for five realistic structural models of hydrogenated amorphous silicon (a-Si:H), based on the local-electronic-structure calculations of Ching, Lam, and Lin. The calculated Auger spectra show peak shifts of the main Si $L_{23}M_{23}M_{23}$(pp) transition up to 6 eV, and distinct line shapes dependent on the H-bonding configuration. Comparison of the calculated spectra to the experimental work of Allie et al. on sputtered a-Si:H clearly shows an expected increased prominence of the $L_{23}M_1M_{23}$(sp) term relative to the $L_{23}M_{23}M_{23}$(pp) term, due to the Si 3s localization upon hydrogenation. The results indicate that valuable structural information is available from Auger spectroscopy for this interesting system.

21182 Activation enthalpy, Gibbs free energy, and entropy for conduction in Na β''-alumina. Wang, J.C. (Solid State Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Physical Review* [*Section*] *B: Condensed Matter;* **26**: No. 10, 5911-5918(15 Nov 1982). Contract W-7405-ENG-26.

The temperature-dependent activation enthalpy ΔH, Gibbs free energy ΔG, and entropy ΔS for the vacancy conduction in Na β''-alumina were extracted from the conductivity data. The value of ΔH calculated from the equation $\Delta H = -d\ln(\sigma T)/d(1/kT)$ decreases from ~0.03 eV at low T to roughly-equal0.03 eV at high T in a form that can be correlated to the decrease of vacancy ordering on a superlattice reported from diffuse x-ray scattering studies. This T variation in ΔH requires a T variation in ΔS according to the thermodynamic relation $d\Delta S/dT = (1/T)d\Delta H/dT$. By setting the integration constant to be zero, the value of ΔS was found to decrease from ~7k (10^{-22} J/K) at low T to ≃0 at high T. As a result, the activation free energy $\Delta G = \Delta H\text{-}T\Delta S$ is much smaller than ΔH at low T. The results are consistent with the calculated small activation energy for diffusion of a single vacancy (~0.02 eV) and the assignment of a low-frequency (~30-cm^{-1}) Raman peak to the attempt mode for diffusion.

21183 Ion-induced release of deuterium from carbon. Wampler, W.R.; Myers, S.M. (Sandia National Labs., Albuquerque, NM (USA)). *Journal of Nuclear Materials;* **111**: 616-621(Nov-Dec 1982). Contract AC04-76DP00789.

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

The ion-induced release of deuterium from carbon was studied by first implanting carbon targets with a high fluence of low-energy (150-600 eV) deuterium to saturate a thin near-surface region and then bombarding the targets with higher-energy ions which penetrate through the deuterium implanted region. Measurements were made of the deuterium release caused by bombardment by hydrogen and helium ions at 3 keV, by helium and carbon ions at 30 keV and by carbon ions at 60 keV. A strong correlation is observed between the ion-induced release rate and the energy lost to atomic collisions by the incident ions. A model for the ion-induced release is described which includes retrapping of the deuterium. Two features of this model are that retrapping results in a non-exponential dependence of the release on incident ion fluence, and in a dependence of the release on the thickness of the deuterium implanted layer. Both of these features are observed in the data which indicates that ion-induced release of deuterium from carbon involves retrapping.

21184 Smectic-A—C transition in three dimensions. Grinstein, G.; Pelcovits, R.A. (IBM Thomas J. Watson Research Center, P. O. Box 218, Yorktown Heights, New York 10598). *Physical Review* [*Section*] *A: General Physics;* **26**: No. 4, 2196-2217(Oct 1982).

A theory of the smectic-A—C transition in which fluctuations in both the elastic and director degrees of freedom are treated is developed. It is argued that in zero magnetic field the asymptotic critical behavior belongs in the universality class of the three-dimensional XY model, in agreement with earlier studies which did not treat fully both elastic and director fluctuations. For most experimental situations the true critical region is unobservably narrow whereupon a simple-harmonic approximation adequately describes the transition; in this approximation the static structure factor exhibits a crossover from algebraic decay charaterized by a nonuniversal exponent eta/sub A/ in the A phase to algebraic decay characterized by a different nonuniversal exponent eta/sub A/C at the critical temperature T/sub c/. The splay elastic constant K_1 is $< \infty$ and $= \infty$ in the A and C phases, respectively, but does not exhibit diverging pretransitional fluctuations in the A phase even arbitrarily neare T/sub c/; it jumps discontinuously at T/sub c/. A strong magnetic field stabilizes long-range positional order in both the A and C phase. There is, nevertheless, no long-range order at T/sub c/ where the density correlation function <m(x)m(o)> decays algebraically; schematically, <m(x)m(o)>~x/sup() -2+eta/ at T/sub c/ in th harmonic theory, while m(x) vanishes like t/sup β/, where t is the reduced temperature. The exponent beta/ and eta, though nonuniversal, satisfy the scaling law 4/beta/ = 2+eta.

These finite-field results are modified at large distances (say x> or approx. =15/sup 5/ A) by the inclusion of anharmonic terms. We find <m(x)m(o)>approx.x/sup() -2+etavertical-barlnk/ at T/sub c/, while <m(x)>approx.t/sup beta-tildevertical-barlnt/ as t/right arrow/0.

21185 X-ray-induced transient attenuation at low temperatures in polymer clad silica (PCS) fibers. Barnes, C.E.; Wiczer, J.J. (Sandia National Labs., Albuquerque, NM). pp 25-34 of Feber optics in adverse environments. Bellingham, WA; Society of Photo-Optical Instrumentation Engineers (1982). Contract AC04-76DP00789.

A set of eight polymer clad silica (PCS) fibers from Quartz and Silice with varying water content, cladding thickness, and cladding material type have been exposed to 50 nsec wide X-ray pulses at different temperatures (-45°C, -25°C, 0°C, +25°C) in order to study the effect of fiber parameters and temperature on the extent of X-ray induced transient attenuation at typical LED wavelengths (820 nm, 900 nm, 940 nm, 1060 nm). The results indicate that, relative to other fiber parameters, the presence of water suppresses the transient attenuation in these fibers especially at the longer wavelengths and lower temperatures. Both the peak transient attenuation, α/sub p/, and the normalized transient attenuation, α(t)/α/sub p/, increased with decreasing temperature as one might expect for thermally-limited recovery processes. The peak transient attenuation also increased with decreasing wavelength, with the wavelength dependence being stronger in the wet fibers. Within the limits of this experiment, the cladding characteristics had no effect on the fiber response to irradiation. Thus, in spite of the fact that the presence of water leads to greater intrinsic fiber attenuation between 900 nm and 1000 nm, its presence is beneficial to low temperature fiber behavior in an ionizing environment.

21186 Neutron scattering study of the phase transition in s-trizine at high pressure. Eckert, J.; Fincher, C.R. Jr.; Heilmann, I.U. (Brookhaven National Lab., Upton, NY). *Solid State Communications;* **41**: No. 11, 839-842(1982). Contract AC02-76CH00016.

The elastic transition in s-triazine ($C_3N_3H_3$) from a trigonal (R anti 3c) high temperature (low pressure) structure to a monoclinic (C2/c) low temperature (high pressure) phase has been investigated at pressures up to 5 kbar using neutron scattering techniques. Neutron diffraction was used to measure the pressure dependence of the order parameter and inelastic scattering to study the softening of the transverse acoustic phonon modes on three isotherms. In both cases the effect of pressure on the transition is found to be described primarily by that on the temperature of the transition.

21187 Thermal study of types of water associated with clinoptilolite. Knowlton, G.D. (Arizona State Univ., Tempe); McKague, H.L.; White, T.R. *Clays and Clay Minerals;* **29**: No. 5, 403-411(1981).

The identification and quantification of the water associated with powdered clinoptilolite and clinoptilolite-bearing tuffs were made using thermogravimetric, vacuum gravimetric, and differential scanning calorimetric techniques. Inflection points on thermogravimetric curves at approximately 80° and 170°C correspond to changes in the proportions of externally adsorbed water to loosely bound zeolite water and loosely bound zeolitic water to tightly bound zeolitic water, respectively. These three types of water can be differentiated by temperatures and heats of dehydration obtained from differential scanning calorimetry. These temperatures and heats of hydration are 75 +- 10°C and 59.2 +- 5.9 kJ/mole H_2O, 171 +- 2°C and 58.7 +- 6.1 kJ/mole H_2O, and 271 +- 4°C and 78.7 +- 7.0 kJ/mole H_2O for external water, loosely bound water, and tightly bound water, respectively. The ratio of loosely bound zeolitic water to tightly bound zeolitic water determined in this study is similar to that reported in the literature from structural determinations, indicating that the desorption properties of clinoptilolite are determined by the specific positions of the water molecules in the structure.

21188 Neutron scattering study of the soft mode in the strongly anisotropic antiferromagnet $RbFeCl_3$. Yoshizawa, H. (Univ. of Tokyo, Japan); Axe, J.D.; Shirane, G. *Solid State Communications;* **38**: No. 3, 241-243(1981). Contract AC02-76CH00016.

The softening of the magnetic excitations in a strongly anisotropic S = 1 antiferromagnet, $RbFeCl_3$ is reported. As T is lowered towards T/sub N/, the softening occurs in a small region around q = 0 and the gap energy vanishes according to the power law Δ ca (T - T/sub N/)$^{0\ 7}$. This effect is interpreted using Lines' correlated-effective-field theory applied to a singlet ground state system.

21189 Role of electron attachment in the breakdown strength of gaseous dielectrics. Christophorou, L.G.; Mathis, R.A.; James, D.R.; McCorkle, D.L. (Oak Ridge National Lab., TN). *Journal of Physics D: Applied Physics;* **14**: 1889-1901(1981). Contract W-7405-ENG-26.

Experimental data on electron attachment and breakdown voltages V/sub s/ for two groups of strongly electron attaching gases - perfluorocarbons and freons (haloethanes and halomethanes) - and some of their mixtures with electron slowing-down gases have been used in an effort to quantify the role of electron attachment on the breakdown strength of gases. The perfluorocarbons (PFCS) considered have positive electron affinities (EAS) and capture electrons at thermal and near-thermal energies principally nondissociatively. The freons capture slow electrons dissociatively producing mainly Cl^-. It was concluded that the V/sub s/ is strongly influenced by the magnitude and energy dependence of the attachment cross-section, σ/sub a/(ϵ). The increase in V/sub s/ with increasing attachment, however, seems to saturate, indicating an upper limit in V/sub s/ of ~ 2.5 times that of SF_6. Electron detachment seems to be indicated for PFCS and SF_6. Besides σ/sub a/(ϵ) and EA, electron scattering at low energies is most significant. N_2 shows excellent synergism with electron attaching additives whose σ/sub a/(ϵ) are large at thermal energies, while polar gases are better with electron attaching additives whose σ/sub a/(ϵ) are large to energies well in excess of thermal. These behaviours could be related to the angular distributions of the scattered electrons from N_2 and the polar molecules.

21190 (CONF-821106—25) Fluid bed consisting of fluid-bed units: a new fluidization method. Kono, H.O. Hwang, J.J. (Institute of Gas Technology, Chicago, IL (USA)). 1982. 41p. Institute of Gas Technoloy, 3424 South State Street, Chicago, IL 60616.

From Annual meeting of heat transfer and energy conversion; Los Angeles, CA, USA (14 Nov 1982).

A new fluidization has been developed that would substantially improve the performance of a fluid bed by installing special internal structures and by dividing the bed vertically into several fluid bed units. Through experimentation the following characteristics are found: the fluid bed can be divided into well stabilized fluid bed units at high superficial gas velocities; the holdup particles in each unit can be determined by the superficial gas velocity and by the design of the internal structure; and the dispersion coefficients of the gas back mixing in the vertical direction are about 10% of the dispersion coefficients in the conventional fluid bed.

21191 (DOE/ER/10645—9) Multivariable internal model control. Garcia, C.E.; Morari, M. (Wisconsin Univ., Madison (USA). Dept. of Chemical Engineering). 1982. Contract AC02-80ER10645. 59p. (CONF-821106—27). NTIS, PC A04/MF A01. Order Number DE83007320.

From Annual meeting of heat transfer and energy conversion; Los Angeles, CA, USA (14 Nov 1982).

Although Pontryagin, Bellman and Kalman developed a revolutionary framework for the optimization of control system performance, only an insignificant number of applications to practical problems has taken place in the chemical process industries. Internal Model Control (IMC), whose fundamentals are described, can close this gap by offering as good a performance as can be achieved by an optimal controller in a package which is more transparent and therefore more appealing to the practitioner.

Up to 1500 pieces of data for each nuclear material sampled by a maximum of 75 laboratories may be analyzed.

The Safeguards Analytical Laboratory Evaluation (SALE) program is a statistical analysis program written to analyze the data received from laboratories participating in the SALE quality control and evaluation program. The system is aimed at identifying and reducing analytical chemical measurement errors. Samples of well-characterized materials are distributed to laboratory participants at periodic intervals for determination of uranium or plutonium concentration and isotropic distributions. The results of these determinations are statistically evaluated and participants are informed of the accuracy and precision of their results.IBM360,3033; FORTRAN IV (97%) and Assembly language (3%); OS/360; 380K bytes of memory are required for execution.

21193 **(BLL-WH—489-(9091.9F)) Process for the removal of oxides of nitrogen and the aqueous solution used.** (British Library, Boston Spa. Lending Div.). Oct 1981. 18p. Avail: British Library Lending Div., Boston Spa, Engl.

Transl. into ENGLISH of Japanese Patent with the German Patent no. 26-58-548.

A technique for removing the oxides of nitrogen from off-gases by a gas-liquid contact process is described. The off-gas is brought into contact with an aqueous solution containing an ion or compound with a reductive action on the oxides of nitrogen. The solution used contains water and (1) at least one hydrazine compound (selected from the group: hydrazine, hydrazine hydrate and salts of inorganic acids of hydrazine (2) a bivalent or trivalent iron ion and (3) an organic compound suitable for forming a chelate compound with the iron ion or an alkali metal salt of the organic compound.

21194 **(CONF-810346—2) Environmental analyses: application of computer-controlled chromatography.** Stetter, J.R. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01. Order Number DE83007781.

From Instrument Society of America symposium; St Louis, MO, USA (23 Mar 1981).

An instrumental approach to chemical analysis and data manipulation has been developed. Major emphasis is placed on computer-controlled chromatographic instrumentation for the isolation, identification, and quantification of individual chemical species. Of particular significance is the analysis of trace organic chemicals, with special emphasis on organics exhibiting biological activity. Samples from complex environmental matrices are collected, prepared for analysis by liquid chromatography, and analyzed by computer-controlled gas chromatography and mass spectroscopy. Improved instrumentation for collecting representative samples from the atmosphere, process streams, and wastewater streams is contributing to the success of this effort.

21195 **(CONF-811037—6) Applications of nuclear reaction analysis for determining hydrogen and deuterium distribution in metals.** Altstetter, C.J. (Illinois Univ., Urbana (USA)). 1981. Contract AC02-76ER01198. 11p. NTIS, PC A02/MF A01. Order Number DE83006974.

From TMS/AIME fall meeting on advanced techniques for the characterization of hydrogen in metals; Louisville, KY, USA (11 Oct 1981).

The use of ion beams for materials analysis has made a successful transition from the domain of the particle physicist to that of the materials scientist. The subcategory of this field, nuclear reaction analysis, is just now undergoing the transition, particularly in applications to hydrogen in materials. The materials scientist must locate the nearest accelerator, because now he will find that using it can solve mysteries that do not yield to other techniques. 9 figures

21196 **(CONF-811160—5) Improved procedure for extraction of aromatic bases from synfuel materials.** Boparai, A.S.; Haugen, D.A.; Schneider, J.F. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 15p. NTIS, PC A02/MF A01. Order Number DE83007681.

From US Department of Energy workshop on chemical characterization of hazardous substances in synfuels; Seattle, WA, USA (4 Nov 1981).

The present study was undertaken to evaluate the conventional aqueous acidbase extraction procedures and to explore alternate conditions for optimizing recovery of aromatic bases. For four procedures the recoveries were measured for 13 components in a mixture containing phenols, polynuclear aromatic hydrocarbons(PAH), primary aromatic amines (PAA), and azaarenes (AA) representative of the types of compounds found in synfuel materials. The results demonstrated that recoveries of hydrophobic 3 to 5 ring PAA and AA can be dramatically increased by using methanol as a cosolvent. The modified procedure is highly efficient for extraction of larger PAA and AA, and does not lead to emulsions when extracting samples of coal-derived materials. 2 figures, 2 tables.

21197 **(CONF-8203115—1) Role of phosphorus in lunar samples: a chemical study.** Jovanovic, S.; Reed, G.W. Jr. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 26p. NTIS, PC A03/MF A01. Order Number DE83007816.

From 13. lunar and planetary conference; Houston, TX, USA (15 Mar 1982).

The roles played by phosphorus present in lunar material may be important in understanding the evolution of the crustal rocks. Quantitative extraction of phosphorus and trace elements associated with possible phosphate phases is the ultimate objective of these studies. Because P may be present in glassy or microcrystalline mesostasis and also as discrete phosphate minerals and as phosphides, chemical procedures provide a tool for its determination along with its complements of trace elements. In these experiments 0.1 M acid was used as a phosphate-specific agent. One experiment was designed to measure how quantitatively P-related constituents are extracted. In consecutive leaching steps more p and REE were dissolved, 76 vs 26% P and 64 vs 37% Sm, from the finer grain sample split. This could be a grain size effect or it could be due to phase separations. Only small amounts of soluble phases remained after the initial 10 minute extraction. Phosphorus and REE are dilute acid soluble in amounts ranging up to 70%. They have sympathetically but are not necessarily highly correlated. Acid soluble fractions of KREEP-rich breccia 14312 and highland breccia 66095 matrix and melt rock clast have chondrite normalized REE patterns similar to that of apatite from a terrestrial gabbro. A different pattern is observed for mare basalt 75055 whole rock and pyroxene and an ilmenite-rich separate. The residues after the acid leach are always HREE enriched relative to the leached fractions. No KREEP-like REE/CH pattern was observed. A systematics for highland rocks based on P_2O_5 and Al_2O_3 is noted. Igneous KREEP rock 15386 and Apollo-16, Fe-rich, high-P_2O_5 glasses reported by Powell et al. (1975) play key roles. 5 figures, 1 table.

21198 **(DOE/ER/13002—T1) Selective metal-ion extraction for multiple metal-ion liquid-liquid exchange reactions. Progress report, February 1, 1982-January 31, 1983.** Tavlarides, L.L. (Syracuse Univ., NY (USA). Dept. of Chemical Engineering and Materials Science). Feb 1983. Contract AC02-82ER13002. 24p. NTIS, PC A02/MF A01. Order Number DE83007972.

Thermodynamic chemical equilibria models and chemical kinetics for the system copper-iron-acid sulfate solutions extracted by β-alkenyl-8-hydroxy quinoline in xylene are studied. Equilibrium extraction data were obtained for the iron-acid-sulfate β-alkenyl-8-hydroxy quinoline-xylene system. A preliminary model which includes the aqueous phase equilibria is being tested to model the data. Kinetic experiments have been completed on the above system for the forward reaction with the liquid jet recycle reactor. It has been determined that the iron-chelation complex is FeR_3 by the method of continuous variation. Kinetic models based on various mechanisms are being tested to describe the data. A one-liter two phase flow reactor system has been developed for the study of extraction efficiencies.

21214 **(K/ET—5033) Comparison of analytical methods for percent phosphorous determination in electroless nickel plate.** Owens, W.W.; Sullivan, H.H. (Oak Ridge Gaseous Diffusion Plant, TN (USA)). 1982. Contract W-7405-ENG-26. 12p. (CONF-820611—4). NTIS, PC A02/MF A01. Order Number DE83007492.

From American Electroplaters Society (SUR/FIN) conference; San Francisco, CA, USA (20 Jun 1982).

Electroless nicke-plate characteristics are substantially influenced by percent phosphorous concentrations. Available ASTM analytical methods are designed for phosphorous concentrations of less than one percent compared to the 4.0 to 20.0% concentrations common in electroless nickel plate. A variety of analytical adaptations are applied through the industry resulting in poor data continuity. This paper presents a statistical comparison of five analytical methods and recommends accurate and precise procedures for use in percent phosphorous determinations in electroless nickel plate. 2 figures, 1 table.

21215 **(LA—9552) Anion exchange x-ray-fluorescence determination of uranium in plutonium.** Martell, C.J.; Hansel, J.M. (Los Alamos National Lab., NM (USA)). Feb 1983. Contract W-7405-ENG-36. 6p. NTIS, PC A02/MF A01. Order Number DE83008363.

An improved method is described for the determiation of uranium in plutonium metal and plutonium compounds using x-ray fluorescence following two anion-exchange separations. Uranium (as the chloride complex) is first separated from most of the 500-mg plutonium sample using anion-exchange resin in glass columns with 8M HCl and ascorbic acid. The eluate solution from this separation contains uranium as $(UO_2Cl_3)^-$, Pu^{+3}, and a small amount of Pu^{+4}. This solution is dried and redissolved in 8M HCl and ascorbic acid to reduce the Pu^{+4} to Pu^{+3}; it is then pipetted onto filter paper impregnated with anion-exchange resin. The plutonium is washed from the resin filter paper with 8M HCl, leaving uranium adsorbed on the paper. The L/sub α1/ x-ray line for the uranium is measured and compared to standards. The precision is 4% relative standard deviation for the concentration range from 5 to 200 μg uranium. The minimum detection limit is 1 μg uranium.

21216 **(LA-UR—83-409) Optical instrumentation for on-line analysis of chemical processes.** Hartford, A. Jr.; Cremers, D.A.; Loree, T.R.; Quigley, G.P. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 6p. (CONF-830420—2). NTIS, PC A02/MF A01. Order Number DE83007557.

From Society of Photo-Optical Instrumentation Engineers conference; Arlington, VA, USA (4 Apr 1983).

Optical diagnostics provide the capability for nonintrusive, on-line, real time analysis of chemical process streams. Several laser-based methods for monitoring fossil energy processes have been evaluated. Among the instrumentation techniques which appear quite promising are coherent anti-Stokes Raman spectroscopy (CARS), laser-induced breakdown spectroscopy (LIBS), and synchronous detection of laser-induced fluorescence (SDLIF). A CARS diagnostic was implemented on a coal gasifier and was successfully employed to measure species concentrations and temperatures within the process stream. The LIBS approach has been used to identify total trace impurities (e.g., Na, K, and S) within a gasifier. Recently, individual components in mixtures of aromatics hydrocarbons have been resolved via the synchronous detection of laser-induced fluorescence. 9 figures.

21217 **(MINTEK-M—50) Development of an on-line gold analyser.** Robert, R.V.D.; Ormrod, G.T.W. (Council for Mineral Technology, Randburg (South Africa)). 12 Oct 1982. 25p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83900725.

An on-line analyser to monitor the gold in solutions from the carbon-in-pulp process is described. The automatic system is based on the delivery of filtered samples of the solutions to a distribution valve for measurement by flameless atomic-absorption spectrophotometry. The sample is introduced by the aerosol-deposition method. Operation of the analyser on a pilot plant and on a full-scale carbon-in-pulp plant has shown that the system is economically feasible and capable of providing a continuous indication of the efficiency of the extraction process.

21218 **(NIM—2116) Optimum opertion of a direct-reading spectrometer with excitation by a 5-kW inductively coupled plasma torch.** Moore, G.L.; Watson, A.E.; Russell, G.M. (National Inst. for Metallurgy, Randburg (South Africa). Analytical Chemistry Div.). 14 Aug 1981. 38p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE82902437.

An examination was made of the optimum operating conditions, degree of interference from sodium ionization, and spectral interferences in a simultaneous 40-channel spectrometer having a data-reduction system controlled by a microprocesser. Excitation is provided by an inductively coupled plasma (ICP) source of medium power, i.e., with a nominal maximum of 5 kW. The optimum conditions were ascertained for atomic lines, for ionic lines, and for compromise multi-element analysis in aqueous solutions and in sodium solutions at concentrations up to 30 g/l, the detection limits for 37 elements being determined. It was found that an increase of approximately 30% in the power input under the optimum conditions for multi-element opertion reduced the interference from ionization caused by up to 30 g of sodium per litre to less than 5% relative. It was found that there is a correlation between the extent of the interference from ionization and the ionization potential of an element. Although the great majority of the lines in the spectral array were generally free of significant spectral overlap, several serious spectral interferences were observed and were determined quantitatively. 20 figures, 17 tables.

21219 **(PB—82-240011) Experimental studies of the geometric and electronic structure of chemisorption binding. Final report Feb 80-Jan 81.** Plummer, E.W.; Gustafsson, T. (Pennsylvania Univ., Philadelphia (USA). Dept. of Physics). May 1982. 59p. NTIS, PC A04/MF A01.

The basic understanding of surface phenomena is fundamental to many areas of importance to gas technology. This project has concentrated on the development and application of new instrumentational techniques to study adsorption phenomena on well characterized metal surfaces. Specifically angle-resolved, photon energy dependent, photoelectron spectroscopy has been utilized to study the geometric and electronic structure of adsorbed molecules. The oscillations in the cross section of the valence orbitals of adsorbed CO with photon energy have been utilized to determine the C-O spacing on the surface. The polarization dependence of the energy distributions from adsorbed hydrocarbons on Pt have revealed the bonding structure of the hydrocarbons as a function of substrate temperature.

21220 **Influence of increasing nuclear charge on the Rydberg spectra of Xe, Cs^+, and Ba^{++}: Correlation, term dependence, and autoionization.** Hill, W.T. III; Cheng, K.T.; Johnson, W.R.; Lucatorto, T.B.; McIlrath, T.J.; Sugar, J. (National Bureau of Standards and Institute for Physical Science and Technology, University of Maryland, College Park, Maryland 20742). *Physical Review Letters;* **49**: No. 22, 1631-1635(29 Nov 1982). Contract W-31-109-ENG-38.

The first experimental-theoretical study of Rydberg autoionizing resonances along an isoelectronic sequence is presented. This analysis demonstrates the intimate connection between electron-electron correlation, term-dependence, and autoionization and underscores the power of multichannel quantum defect theory in analyzing complex spectra.

21221 **Conformational dependence in the mass spectrum of cyclohexanecarboxaldehyde.** Splitter, J.S.; Calvin, M. (Univ. of California, Berkeley). *Journal of Organic Chemistry;* **47**: No. 23, 4545-4552(5 Nov 1982). Contract AC03-76SF00098.

The mass spectrum of cyclohexanecarboxaldehyde (1) was shown to fit a composite of the mass spectra of the equatorial and axial conformers. By comparison of the fragmentation processes from 1^+. with the processes from the fixed conformers corresponding to 1^+., the processes involving hydrogen abstraction by the oxygen atom as the initial step were attributed to the axial conformer, and the processes involving initial ring bond cleavage were attributed to the equatorial conformer. The abundant α-cleavage ion at 50 eV was attributed to both conformers, analogous to its occurrence in the fixed conformers. The loss of C_2H_4O from 1^+. was found to be loss of CH_3CHO and thus was attributed to equatorial 1^+.. Initial hydrogen abstraction in axial 1^+. was found to occur at a faster rate than initial ring bond stretching, whereas in equatorial 1^+. initial ring bond stretching was found to occur at a faster rate than conversion to axial 1^+..

21222 **Improved sensitive assay for polonium-210 by use of a background-rejecting extractive liquid-scintillation method.** Case, G.N.; McDowell, W.J. (Oak Ridge National Lab., TN (USA)). *Talanta;* **29**: No. 10, 845-848(Oct 1982).

A procedure is described for the determination of polonium-210 in various types of materials, including ores, mill tailings, and environmental samples, by a combined solvent-extraction liquid-scintillation spectrometry method. Concentration of polonium-210 and separation from interfering elements (such as iron) are accomplished by extraction from a 7 M phosphoric acid-0.01 M hydrochloric acid solution with 0.20 M trioctylphosphine oxide solution (together with a scintillator) in toluene. The polonium-210 is determined by counting the 5.3-MeV alpha-radiation with a photon/electron-rejecting alpha liquid scintillation spectrometer. Extraction coefficients of over 1000 for polonium ensure quantitative recovery, and no other alpha-emitters in the decay chains of uranium-238, uranium-235 and thorium-232 are extracted. The results for several samples show the relative standard deviation to be approximately 1.2%. A lower limit of detection of 0.0038 pCi is proposed, based on a counting time of 1000 min and an easily obtainable background of 0.01 cpm for the alpha peak.

21223 **Ultraviolet spectrometric determination of phenols as phenolate anions.** Disinger, J.; Manahan, S.E. (Univ. of Missouri, Columbia). *Analytical Letters;* **15**: No. 12A, 1017-1029(1982). Contract AS20-81LC10519.

This report describes a method which has been employed using phenolate ion absorption at 291 nm for the measurement of phenols in water. The monohydric phenols measured are among those abundant in coal gasification by-products. The errors obtained in employing an average proportionality constant for the calculation of concentrations of individual phenols are discussed. Using this method it is possible to calculate a reasonably accurate composite phenols concentration for a mixture of phenols.

21224 **The solvent extraction behavior of rhenium. Part II. The hydrochloric acid-tributyl phosphate system.** Pruett, D.J.; McTaggart, D.R. (Oak Ridge National Lab., TN). *Separation Science and Technology;* **17**: No. 8, 1091-1100(1982). Contract W-7405-ENG-26.

The solvent extraction of heptavalent rhenium from aqueous hydrochloric acid by tributyl phosphate (TBP) in n-dodecane (NDD) has been studied over a wide range of TBP and HCl concentrations at 25, 40, and 60°C. The extraction was found to proceed according to the reaction $3TBP + H^+ + ReO^-_4 = [HReO_4.3TBP]$. A discussion of the possible nature of the organic phase complex is presented, along with values of ΔG, ΔH, ΔS, and the equilibrium constant for the extraction reaction. The behavior of the $KReO_4$-H_2O-HCl-TBP system is compared and contrasted with that of the $KReO_4$-H_2O-HNO_3-TBP system and with the analogues $KTcO_4$ systems.

21225 **Beam-foil spectroscopy.** Berry, H.G.; Hass, M. (Physics Division, Argonne National Laboratory, Argonne, Illinois 60439). *Annual Review of Nuclear Science;* **32**: No. 1, 1-34(1982). Contract W-31-109-ENG-38.

A brief survey of some applications of beam-foil spectroscopy is presented. Among the topics covered are lifetime and magnetic moment measurements, nuclear alignment, and polarized light production. (AIP)

21226 **(DRIC-T—6367) Application of resonance Raman spectrometry in high performance liquid chromatography.** Saito, S.; Teramae, N.; Tanaka, N. Translated from *Nippon Kagaku Kaishi ;* 9: 1363-1366(1980). 13p. Defence Research Information Centre, Orpington, England.

A detection system for the sensitive and selective analysis of the eluted components of a high performance liquid chromatograph is described. The system connects a laser Raman spectrophotometer to a high performance LC. Results from investigations of dimethylaminoazobenzene compounds show that the LC Raman effect is highly sensitive and has a high degree of selectivity. It is possible to evaluate independently compounds which can not be separated by other methods. (ESA)

21227 **(ANL/NESC—487) STEAM-67; 1967 ASME steam and water properties.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Kaiser, A.H. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048487.

STEAM-67 is a set of routines for calculating the properties of steam and water according to the ASME Steam Tables, 1967, which have been modified in accordance with the ASME paper. Modifications were made to improve program running time as well as to correct some existing program errors. Corrections were also made to routines for the liquid region to improve accuracy on the IBM360 computer. CENTER is an auxiliary control program which selects the proper STEAM-67 routines.IBM360,370,303x; FORTRAN IV; OS/360; 140K bytes of memory are required to execute the sample problems.

21228 **(CONF-810294—1) Spontaneous reactions of xenon, fluorine, and antimony pentafluoride.** Stein, L. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 11p. NTIS, PC A02/MF A01. Order Number DE83007666.

From 5. winter fluorine conference; Daytona Beach, FL, USA (1 Feb 1981).

Mixtures of xenon and fluorine gases react spontaneously with liquid antimony pentafluoride in the dark to form solutions of $XeF^+ Sb_2F_{11}^-$. Dixenon cation, Xe_2^+, is formed as a labile intermediate product and is oxidized by the fluorine to XeF^+ cation. The rate of the overall reaction is proportional to the partial pressure of xenon and the partial pressure of fluorine. This direct combination of reagents provides a simple method for the preparation of $XeF^+ Sb_2F_{11}^-$. 5 figures, 1 table.

21229 **(CONF-821106—26) Mechanism and kinetics of NO/sub x/ gas absorption into alkaline solutions: considerations for selectivity toward hydroxylamine.** Kono, H.O.; Ninomiya, K. (Illinois Inst. of Tech., Chicago (USA); Ube Industries Ltd., Ube (Japan)). 1982. 29p. Institute of Gas Technology, 3424 South State Street - IIT Center, Chicago, IL 60616.

From Annual meeting of heat transfer and energy conversion; Los Angeles, CA, USA (14 Nov 1982).

The adsorption of NO and NO_2 gases into alkaline solutions such as ammonium sulfite is an industrially important reaction for the production of hydroxylamine. Because of the unstable characteristics of the NO_2^- ion formed in the gas-liquid interface film (liquid-side film), it is important to control the interface liquid film in order to attain a high selectivity of the reaction. 8 figures, 6 tables.

21230 **(DOE/ER/10485—T3) Surface studies of WO_3/Al_2O_3 and Ni/W/Al_2O_3 catalysts.** (Pittsburgh Univ., PA (USA)). 1980. Contract AC02-79ER10485. 26p. NTIS, PC A03/MF A01. Order Number DE83007299.

This study has provided a comprehensive picture of the nature of the tungsten species present in WO_3/Al_2O_3 and Ni/W/Al_2O_3 catalysts. It has been shown that WO_3/Al_2O_3 and MoO_3/Al_2O_3 catalysts are very similar structurally. Preliminary results for Ni/W/Al_2O_3 catalysts have shown that the promoting action of Ni is different than that of Co in Co/Mo/Al_2O_3 catalysts. Results led to the following conclusions: (1) At low loading (< 15% WO_3) the surface tungsten species is a tetrahedrally coordinated WO_4^{2-} interaction complex. (2) Between 15 to 24% WO_3 a polymeric WO_3 (octahedral) species is formed in addition to the tetrahedral interaction species. (3) Above 24% WO_3 crystallites of bulk WO_3 formed on top of the tungsten monolayer. (4) No detectable amounts of Al_2

$(WO_4)_3$ were presented in any of the catalysts studied. (5) The tungsten interaction species are not reducible while the bulk WO_3 deposited above 24% WO_3 is reduced to metallic W. (6) Nickel ions are incorporated into the tungsten monolayer displacing a portion of the tungsten interaction species. (7) The nickel species are completely reduced to metallic Ni. (8) The comparative x-ray Photoelectron Spectroscopy (ESCA) Laser Raman Spectroscopy (LRS) and Low Energy Ion Scattering Spectroscopy (ISS) studies demonstrate the complimentary nature of these techniques for the study of heterogeneous catalysts. 6 figures, 3 tables.

21231 (KFK—3392) Interfacial tension in systems involving TBP in dodecane, nitric acid, uranyl nitrate and water. Kolarik, Z.; Pipkin, N. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Heisse Chemie). Aug 1982. 17p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83750182.

The interfacial tension was measured at 25°C in the systems TBP - n-dodecane/nitric acid - water and TBP - n-dodecane/nitric acid - uranyl nitrate - water. Empirical equations describing the interfacial tension as a function of the concentration of TBP in the starting organic phase and of uranium-(VI) and nitric acid in the equilibrium aqueous phase were suggested. In the absence of uranium (VI), the interfacial tension can also be correlated with the concentration of water in the equilibrium organic phase. Free TBP, hydrated or nonhydrated, and hydrated TBP solvates of nitric acid are interfacially active. Anhydrous TBP solvates of nitric acid and the TBP solvate of uranyl nitrate, which neither is hydrated, do not exhibit any visible interfacial activity.

21232 (ORNL/Sub—81-1012/2) General approach to the testing of binary solubility systems for thermodynamic consistency. Consolidated Fuel Reprocessing Program. Hamm, L.L.; Van Brunt, V. (South Carolina Univ., Columbia (USA). Coll. of Engineering). Aug 1982. Contract W-7405-ENG-26. 405p. NTIS, PC A18/MF A01. Order Number DE83007173.

A comparison of implicit Runge-Kutta and orthogonal collocation methods is made for the numerical solution to the ordinary differential equation which describes the high-pressure vapor-liquid equilibria of a binary system. The systems of interest are limited to binary solubility systems where one of the components is supercritical and exists as a noncondensable gas in the pure state. Of the two methods - implicit Runge-Kuta and orthogonal collocation - this paper attempts to present some preliminary but not necessarily conclusive results that the implicit Runge-Kutta method is superior for the solution to the ordinary differential equation utilized in the thermodynamic consistency testing of binary solubility systems. Due to the extreme nonlinearity of thermodynamic properties in the region near the critical locus, an extended cubic spline fitting technique is devised for correlating the P-x data. The least-squares criterion is employed in smoothing the experimental data. Even though the derivation is presented specifically for the correlation of P-x data, the technique could easily be applied to any thermodynamic data by changing the endpoint requirements. The volumetric behavior of the systems must be given or predicted in order to perform thermodynamic consistency tests. A general procedure is developed for predicting the volumetric behavior required and some indication as to the expected limit of accuracy is given.

21233 Dynamics of the reaction $D^+Z+C \rightarrow CD^+ + D$ at kinetic energies between 0.002 and 14 eV. Schuette, G.F.; Gentry, W.R. (Chemical Dynamics Laboratory, Department of Chemistry, University of Minnesota, Minneapolis, Minnesota 55455). *Journal of Chemical Physics;* 78: No. 4, 1777-1785(15 Feb 1983).

Absolute total reaction cross sections and product kinetic energy distributions have been measured for the reaction $D^+{}_2+C \rightarrow CD^+ + D$ over the range of initial kinetic energies between 0.002 and 14 eV. At very low collision energies, the reaction cross section is accurately proportional to the capture cross section calculated for Pi approaches of the reactants, taking into account the long-range charge-quadrupole and charge-induced dipole interactions. About 37% of close collisions on Pi surfaces lead to $CD^+ + D$ reaction products. Reactions on Σ surfaces are inhibited at low kinetic energies by a strongly repulsive charge-quadrupole interaction at large separations. The reaction is direct at all kinetic energies, with the CD^+ product scattered preferentially in the direction of the incident C atom. The reaction is extremely exoergic, and the CD^+ product is formed with an internal energy very near its dissociation limit over a large range of collision energies. Although the experimental results do not give direct information on the electronic state pathways to the observed products (except that the reactants approach asymptotically on Pi surfaces), the electronic state correlations suggest a low-energy adiabatic pathway to the CH^+ (^{3}Pi) first excited state of the products, which is consistent with both the measured values of the reaction cross sections and the reaction energetics.

21234 Studies on molybdena catalysts. XI. Oxygen chemisorption on sulfided catalysts. Zmierczak, W.; MuraliDhar, G.; Massoth, F.E. (Univ. of Utah, Salt Lake City). *Journal of Catalysis;* 77: No. 2, 432-438(Oct 1982).

Catalysts containing Mo or CoMo on various supports were prepared. Oxygen chemisorption on the sulfided catalysts was measured by a flow gravimetric technique. Activities of the catalysts were determined for thiophene hydrodesulfurization (HDS) and hexene hydrogenation in a catalytic microreactor at atmospheric pressure. Oxygen chemisorption increased with adsorption temperature. A definite adsorption was only obtained at -78°C, adsorption at higher temperatures continuing for over 4 hr. For O_2 chemisorption at -78°C: (i) CoMo versus Mo catalysts showed only marginally higher values; (ii) O_2 chemisorption did not correlate with HDS activity; and (iii) O_2 chemisorption showed a reasonable correlation with hydrogenation activity. It is probable that O_2 chemisorption reflects the general state of dispersion of the active Mo phase rather than specific HDS or hydrogenation sites.

21235 Oxygen on iron oxide: effect on the selective oxidation of butane. Yang, B.L.; Kung, H.H. (Northwestern Univ., Evanston, IL). *Journal of Catalysis;* 77: No. 2, 410-420(Oct 1982).

The effect of preadsorbed and gas phase oxygen on the selective oxidation of butene to butadiene on α-iron oxide was investigated using adsorption-desorption and pulse reaction technique. It was found that irreversibly adsorbed oxygen did not affect the butene oxidation reaction. However, the presence of gas phase oxygen significantly reduced the production of butadiene and increased the production of carbon dioxide. This decrease in butadiene production was due to the high reactivity of adsorbed butadiene precursors toward weakly adsorbed oxygen. However, these butadiene precursors were not reactive toward nitrous oxide. Therefore, under steady-state conditions, the rate of production of butadiene is determined by the competition between the desorption of butadiene and the degradation of the precursors by oxygen.

21236 Incorporation of collinear exact quantum reaction probabilities into three-dimensional transition-state theory. Bowman, J.M.; Ju, G.Z.; Lee, K.T. (Illinois Inst. of Tech., Chicago). *Journal of Physical Chemistry;* 86: No. 12, 2232-2239(10 Jun 1982). (CONF-8106160—). Contract AC02-81ER10900.

From American conference on theoretical chemistry; Boulder, CO, USA (21 Jun 1981).

This article shows how collinear exact quantum reaction probabilities can be naturally incorporated into transition-state theory for reactions with a collinear transition state. New expressions are derived for average cross sections which reduce to the previous transition-state theory ones when the collinear reaction probabilities are replaced by the appropriate transition-state theory approximants. Cross sections are calculated for the $H + H_2\ (\nu=0) \rightarrow H_2(\nu'=0) + H$ reaction and the $F + H_2(\nu=0) \rightarrow HF(\nu'=2)$, $HF(\nu'=3) + H$ reactions. Rate constants for the $H(D) + H_2(\nu=0)$, $H(D) + H_2(\nu=1)$ are also calculated and compared with experiment and previous calculations.

21237 **Applications of a simple dynamical model to the reaction path Hamiltonian: tunneling corrections to rate constants, product state distributions, line widths of local mode overtones, and mode specificity in unimolecular decomposition.** Cerjan, C.J.; Shi, S.; Miller, W.H. (Lawrence Berkeley Lab., CA). *Journal of Physical Chemistry;* **86**: No. 12, 2244-2251(10 Jun 1982). (CONF-8106160—). Contract W-7405-ENG-48.

From American conference on theoretical chemistry; Boulder, CO, USA (21 Jun 1981).

A simple but often reasonably accurate dynamical model--a synthesis of the semiclassical perturbation (SCP) approximation of Miller and Smith and the infinite order sudden (IOS) approximation--has been shown previously to take an exceptionally simple form when applied to the reaction path Hamiltonian derived by Miller, Handy, and Adams. This paper shows how this combined SCP-IOS reaction path model can be used to provide a simple but comprehensive description of a variety of phenomena in the dynamics of polyatomic molecules.

21238 **Semiclassical theory of intensities of vibrational fundamentals, overtones, and combination bands.** Koszykowski, M.L. (Sandia National Labs., Livermore, CA); Noid, D.W.; Marcus, R.A. *Journal of Physical Chemistry;* **86**: No. 12, 2113-2117(10 Jun 1982). (CONF-8106160—). Contract W-7405-ENG-26.

From American conference on theoretical chemistry; Boulder, CO, USA (21 Jun 1981).

Quantum mechanical and semiclassical results are compared for the spectrum of the Morse oscillator. When an average quantum number $[(n + m)/2]$ trajectory is employed for an $n \rightarrow m$ transition good agreement is obtained between the quantum and semiclassical intensities and between the frequencies, for the fundamental and overtones studied. Spectra of nonrotating OCS in the quasiperiodic and chaotic regions are presented, and the intensities of a number of overtones and combination bands are calculated. Even very low intensity transitions are observed.

21239 **Criteria for quantum chaos.** Heller, E.J. (Los Alamos National Lab., Albuquerque, NM); Davis, M.J. *Journal of Physical Chemistry;* **86**: No. 12, 2118-2124(10 Jun 1982). (CONF-8106160—).

From American conference on theoretical chemistry; Boulder, CO, USA (21 Jun 1981).

This paper reviews some of the opinions on quantum chaos put forth at the 1981 American Conference on Theoretical Chemistry and presents evidence to support the author's point of view. The degree of correspondence between classical and quantum onset and extent of chaos differs markedly according to the definition adopted for quantum chaos. At one extreme, a quantum generalization of the classical Kolmolgorov entropy which give zero entrophy for quantum systems with a discrete spectrum regardless of the classical properties, was a suitable foundation for the definition of quantum chaos. At the other, the quantum phase space definition shows generally excellent correspondence to the classical phase space measures. The authors preferred this approach. Another point of controversy is the question of whether the spectrum of energy levels (or its variation with some parameter of the Hamiltonian) is enough to characterize the quantum chaos (or lack of it), or whether more information is needed (i.e., eigenfunctions). The authors conclude that one does not want to rely upon eigenvalues alone to characterize the degree of chaos in the quantum dynamics.

21240 **Theory of polyatomic photodissociation. Adiabatic description of the dissociative state and the translation-vibration interaction.** Kresin, V.Z.; Lester, W.A. Jr. (Lawrence Berkeley Lab., CA). *Journal of Physical Chemistry;* **86**: No. 12, 2182-2187(10 Jun 1982). (CONF-8106160—). Contract W-7405-ENG-48.

From American conference on theoretical chemistry; Boulder, CO, USA (21 Jun 1981).

An adiabatic method for the evaluation of the nuclear wave function describing the final dissociative state and a rigorous description of the D state following adiabatic formulation are presented in this paper. The vibrational frequencies of the fragments are found to depend on the interfragment distance. The role of the translation-vibration interaction in polyatomic photodissociation is also discussed.

21241 **Collective excitations in π-electron systems.** Kresin, V.Z. (Lawrence Berkeley Lab., CA). *Journal of Physical Chemistry;* **86**: No. 12, 2187-2190(10 Jun 1982). (CONF-8106160—). Contract W-7405-ENG-48.

From American conference on theoretical chemistry; Boulder, CO, USA (21 Jun 1981).

A group of collective levels is found below the usual first-excited electronic energy level. The collective levels correspond to the poles of the two-particle Green function. The experimentally observed multiplet structure of the molecular spectra of large aromatic system is connected with these levels. Another group of levels is located considerably higher and corresponds to plasmon vibrations.

21242 **Incorporation of quantum effects in generalized-transition-state theory.** Truhlar, D.G.; Isaacson, A.D.; Skodje, R.T.; Garrett, B.C. (Univ. of Minnesota, Minneapolis). *Journal of Physical Chemistry;* **86**: No. 12, 2252-2261(10 Jun 1982). (CONF-8106160—). Contract AC02-79ER10425.

From American conference on theoretical chemistry; Boulder, CO, USA (21 Jun 1981).

This is a status report on practical aspects of the incorporation of quantum effects in generalized-transition-state theory. Attention is centered on methods for bound-mode quantization, including anharmonicity, and for estimating tunneling probabilities with account of the effects of reaction-path curvature. The emphasis is on methods that can be applied generally, and these methods are tested against accurate quantal results that are available for a few relatively simple cases. A selection of new calculations that illustrate important effects and some published results in the same context are presented in this report. The results presented here are for the reactions $H + H_2$, $D + D_2$, $Mu + H_2$, $Mu + D_2$, $Cl + T_2$, $Cl + HD$, $Cl + DH$, $I + H_2$, $Cl + HCl$, $OH + H_2$, $OH + HD$, $OH + DH$, and for the bound species H_2O and SO_2.

21243 **Comments on the linear free-energy correlation between O_3 and OH addition reactions reported in Rate Constants for the Gas-Phase Reactions of O_3 with a Series of Carbonyls at 296 K.** Gaffney, J.S.; Levine, S.Z. (Brookhaven National Lab., Upton, NY). *International Journal of Chemical Kinetics;* **14**: 1281-1283(1982).

Recently, Atkinson et al. reported measurements on the reaction of ozone with a series of carbonyls. In that study a correlation between ozone addition and hydroxyl-radical addition reactions was employed to predict OH addition coefficients for acrolein and crotonaldehyde of approximately 2×10^{-12} and 5×10^{-12} cm^3 $molecule^{-1}$ s^{-1}, respectively. These estimates, as pointed out by the authors, are in disagreement (factor of 2 to 3 lower) with the rate coefficients previously predicted by ourselves for the same OH addition reactions using linear correlations with both ionization potentials and $O(^3P)$ rate data. It was also suggested in that paper that this discrepancy was probably due to the likelihood that $O(^3P)$ atoms react significantly with carbonyls via an abstraction mechanism, that is, $O(^3P)$ rate data could not be appropriately correlated with OH addition reaction data. We believe that another, more probable, explanation exists for the above-mentioned discrepancy in rate constant estimates, and that this explanation involves the manner in which the correlation method is handled. Because this method of evaluating rate constants represents a potentially important predictive tool for chemical modelers, we feel it is necessary to reconcile the apparent disagreement in the OH-acrolein and OH-crotonaldehyde addition reaction coefficients estimated from O_3 correlations as compared to ionization potential and $O(^3P)$ correlations. In doing so, we will also demonstrate the necessity of employing linear correlations in a consistent manner.

21244 **Kinetics and product yield of the reaction of HO with HNO_3.** Nelson, H.H.; Marinelli, W.J.; Johnston, H.S. (Lawrence Berkeley Lab., CA). *Chemical Physics Letters;* **78**: No. 3, 495-499(15 Mar 1981). Contract W-7405-ENG-48.

Room temperature rate constants for the reaction $HO + HNO_3$ were obtained by laser flash photolysis; HO was observed by resonance fluorescence [k +- 2 σ = (8.2 +- 1.8) x 10^{-14} cm^3 s^{-1}]; and the product NO_3 was measured by laser absorption [(10.6 +- 3.4) x 10^{-14} cm^3 s^1]. The nitrate free radical NO_3 was a major product of the reaction. 4 figures.

21245 Ion mobilities and residence times under chemical ionization conditions. Polley, C.W. Jr.; Illies, A.J.; Meisels, G.G. (Univ. of Nebraska, Lincoln). *Analytical Chemistry;* **52**: No. 12, 1797-1803(Oct 1980). Contract AC02-76ER02567.

A pulsed chemical ionization (CI) source employing a coaxial electron entrance-ion exit geometry has been used to obtain ion mobility data for various CI reagent ions. Ion mobilities obtained by this method are in good agreement with results obtained by drift tube measurements where comparison is possible. Ion mobility measurements performed at 125 to 150°C provide information regarding the residence times of reagent ions under typical CI conditions. Residence times lie in the range 50 to 150 μs (E/P = 5V/(cm torr); T = 150°C; ion pathlength = 1.0 cm).

21246 The London approximation and the calculation of dispersion interactions as a sum of atom-atom terms. Yoffe, J.A.; Maggiora, G.M. (Univ. of Kansas, Lawrence). *Theoretica Chimica Acta;* **56**: 191-198(1980). Contract AC02-76ER02837.

A London approximation utilizing atomic valence state ionization potentials and static polarizabilities yields C_6 results in good agreement with accurate values for a number of systems. Generally there is considerable improvement over the results obtained using the London approximation in conjunction with molecular parameters and reasons for this are discussed.

21247 (KFK-tr—674) Reaction between alcohol and nitric acid in the presence of metal nitrates. Dansi, A. Translated from *Gazzetta Chimica Italiana ;* **62**: 953-958(1932). 11p. (In German). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83900869.

A study is made of reactions between alcohol and copper and nickel nitrates as well as between copper nitrate and isonitrosoacetate with reference to the production of mercury explosives.

21248 (BMFT-FB-T—81-058) Crosslinking of polyethylene in view of an application in wire coating. Final report, December 1979. Franzkoch, B.; Beiss, K. (Technische Hochschule Aachen (Germany, F.R.)). Apr 1981. 261p. (In several languages). NTIS, PC A12/MF A01.

Bundesministerium fuer Forschung und Technologie REFS Sponsored by Bundesministerium fuer Forschung und Technologie.

Different polyethylene crosslinking methods to improve the characteristics of the material as wire coating were tested. It was determined that polyethylene curing by UV radiation is not suitable for application in wire coating. At higher insulation thickness, too much radiation is absorbed to cure deeper layers of the insulation. Using a shear gap die, melt temperatures can be raised within a very short time to a level high enough to initiate peroxide decay, thus starting the crosslinking reaction. Application of microwaves and use of special microwave-sensitive peroxides is recommended. These peroxides have to be polar to absorb energy from the alternating field. The energy splits the peroxy group of the molecule, thus generating radicals, and the crosslinking reaction takes place. (ESA)

21249 (CONF-8105105—7) Electronic structure of iron phthalocyanine and its analogs: a theoretical study. Sabelli, N.H.; Lee, L.K.; Melendres, C.A. (Illinois Univ., Chicago (USA). Dept. of Chemistry; Argonne National Lab., IL (USA)). Apr 1981. Contract W-31-109-ENG-38. 14p. NTIS, PC A02/MF A01. Order Number DE83007590.

From Symposium on electrocatalyis; Minneapolis, MN, USA (10 May 1981).

Molecular electronic structures of the dianions and iron complexes of phthalocyanine and other macrocyclic compounds (i.e., tetrabenzoporphyrin, tetrazaporphyrin and porphyrin) which are of interest in oxygen electrocatalysis have been calculated using CNDO/INDO molecular orbital methods. Significatn differences are found between the electron distributions in phthalocyanine and porphyrin due mainly to a difference in the nature of the atom bridging the indole and pyrrole ligands. Both iron complexes of phthalocyanine and porphyrin have a quintuplet molecular electronic ground state with iron in an intermediate spin state in the former and high spin in the latter. Binding of oxygen to the iron center in model compounds of iron phthalocyanine and iron porphyrin was studied. Side-on configuration appears to be preferred in the oxygen-phthalocyanine system and end-on bonding in the oxygen-porphyrin complex. The effect of catalyst support, electron delocalization by dimerization, and protons in solution on the oxygen binding by iron phthalocyanine was also examined and preliminary results are described. 2 figures, 3 tables.

21250 (DOE/PC/30075—12) Cross-reaction networks in the catalytic hydrodenitrogenation of synthetic liquid fuels. Quarterly report, November 1, 1982-January 31, 1983. Satterfield, C.N.; Smith, C.M.; Ingalls, M. (Massachusetts Inst. of Tech., Cambridge (USA)). 1983. Contract AC22-80PC30075. 11p. NTIS, PC A02/MF A01. Order Number DE83006377.

Experimental studies in the trickle bed reactor have continued with a fresh sample of our standard NiMo/Al_2O_3 catalyst. This was allowed to reach steady-state activity which required about 150 hours after which the enhancing effect of water on the HDN of quinoline was observed by the addition of an alcohol. We are currently studying the reversibility of this water effect and the interaction of H_2S with H_2O. Some of our earlier work suggested that NH_3 has a strong inhibiting effect on hydrogenation reactions and we have now re-examined this effect in a collaborative effort with Prof. S. Gueltekin of the University of Petroleum and Minerals, Dhahran, Saudi Arabia. Studies at 330 to 375°C and 3.55 and 6.9 MPa total pressure on a commercial NiMo/Al_2O_3 catalyst showed that addition of H_2S to propylbenzene (PBz) (each at 13.3 kPa) depressed its hydrogenation rate by a factor of two. NH_3 alone at 13.3 kPa, or with H_2S, depressed the hydrogenation rate by a factor of 8 or more. In all cases the hydrogenation rate was first order with respect to propylbenzene. The significance of these results is that it suggests that addition of NH_3 during hydrodenitrogenation (e.g. by recycling) may reduce hydrogen consumption. We intend to pursue this possibility further by experimental studies in our trickle-bed reactor.

21251 (LA-UR—83-260) Untangling the water gas shift from Fischer-Tropsch: a Gordian knot. Rofer-Depoorter, C.K. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 68p. (CONF-830410—1). NTIS, PC A04/MF A01. Order Number DE83006066.

From 17. Middle Atlantic Regional meeting of the American Chemical Society; White Haven, PA, USA (6 Apr 1983).

The water gas shift reaction is an integral part of the Fischer-Tropsch synthesis. Although it may appear convenient to consider the water gas shift a separate reaction, in some cases, a detailed examination of the mechanism indicates theat the water gas shift and other synthesis gas reactions share several elementary reactions. Experimental support for the relevant elementary reactions for the water gas shift on metals, metal oxides, and in homogeneous solution is examined, from both surface and complex chemistry. Multiple paths leading to a net water gas shift reaction may be available; oxygen transfer and reaction through C-H-O intermediates may take place. 185 references, 6 tables.

21252 Dynamics of the reaction $D^+Z+F(^2P) \rightarrow FD^+ + D$ at kinetic energies between 0.002 and 30 eV. Schuette, G.F.; Gentry, W.R. (Chemical Dynamics Laboratory, Department of Chemistry, University of Minnesota, Minneapolis, Minnesota 55455). *Journal of Chemical Physics;* **78**: No. 4, 1786-1794(15 Feb 1983).

The merged molecular beam technique has been used to study the reaction $D^+{}_2+F(^2P) \rightarrow FD^+ + D$ over the kinetic energy range from 0.002 to 30 eV. The energy dependence of the absolute total reaction cross section at low kinetic energies indicates that reaction occurs with unit probability for capture collisions on potential energy surfaces which correlate with Pi intermediates. This result is consistent with the adiabatic state correlations, which connect the reactants to the ground state products $FD^+(^2Pi)+D(^2S)$ via both the ^1Pi and ^2Pi surfaces in collinear approches. At higher energies, an inflection in the reaction cross section is thought to be caused by onset of the endoergic reaction to give excited state products $FD^+(^2\Sigma)+D(^2S)$. The reaction mechanism is direct over the entire range of collision energies, with the FD^+ product scattered preferentially in the direction of the incident F-atom reactant in the center-of-mass system, except for extremely high collision energies (E/sub i/ = 25 eV), where a roughly symmetric distribution is seen. Very little theoretical work has been carried out on the dynamics of reactions between two open-shell species. The relative simplicity of the $D^+{}_2+F(^2P)$ system makes it an attractive candidate for such studies.

21253 Photonitration of phenols by tetranitromethane under visible light. Seltzer, S. (Brookhaven National Lab., Upton, NY); Lam, E.; Packer, L. *Journal of the American Chemical Society;* **104**: No. 23, 6470-6471(17 Nov 1982).

Recent laboratory studies with bacteriorhodopsin (bR) have uncovered a different type of TNM-nitration reaction of phenols. Nitration of a tyrosine residue of bR by TNM has been found to be light dependent ($\lambda \geqq 530$ nm) at pH 5.5. This observation prompted a study of model systems. This report discusses the possible synthetic utility that bR may have in the nitration of labile systems and the mechanistic information that they provide.

21254 Synthesis of benzyl and benzyloxycarbonyl base-blocked 2′-deoxyribonucleosides. Watkins, B.E.; Rapoport, H. (Univ. of California, Berkeley). *Journal of Organic Chemistry;* **47**: No. 23, 4471-4477(5 Nov 1982). Contract AC03-76SF00098.

Acylimidazoles have been alkylated with trialkyloxonium tetrafluoroborates to form acylimidazolium salts. These salts, particularly (benzyloxycarbonly)imidazolium salts, are shown to be effective agents for the direct, mono-N-protection of deoxynucleosides as their acyl derivatives. These acyl nucleosides are also available via thiocarbamate intermediates. Thus 3′,5′-bis(tert-butyldimethylsilyl)-2′-deoxyguanosine, on treatment with phenyl chlorothioformate, gave the 6-thiophenyl-substituted purine (1). The thiophenyl group of (1) can be replaced by hydrogen, amino, and alkoxy groups to give a variety of substituted purine deoxyribonucleosides.

21255 Reductive cleavage mechanism of diphenyl ether and apparent ipso trapping of an intermediate radical anion with a silyl ether. Patel, K.M.; Baltisberger, R.J.; Stenberg, V.I.; Woolsey, N.F. (Univ. of North Dakota, Grand Forks). *Journal of Organic Chemistry;* **47**: No. 22, 4250-4254(22 Oct 1982). Contract FG22-78ET13380;AC01-76ET10516.

Chemical evidence for a radical anion mechanism in the case of reductive cleavage of diphenyl ether under Na/HMPA conditions is reported. The product phenyl radical abstracts a hydrogen atom instead of successive capture of an electron. Other ether (dibenzyl, benzyl phenyl, and methyl phenyl) are also cleaved under these reductive conditions. The initally formed radical anion of diphenyl ether is apparently largely trapped before cleavage by trimethylsilyl ethers leading ultimately to ipso phenyl substitution. The mechanism of ipso substitution is discussed.

21256 Formic acid and the high-temperature reductive desulfurization of aromatic sulfides. Van Buren, R.L.; Baltisberger, R.J.; Woolsey, N.F.; Stenberg, V.I. (Univ. of North Dakota, Grand Forks). *Journal of Organic Chemistry;* **47**: No. 21, 4107-4110(8 Oct 1982).

When diphenyl sulfide is heated with formic acid to 450°C, it is converted to benzene, toluene, thiophenol, thioanisole, and benzoic acid. By increasing the time of reaction, diphenyl sulfide is converted completely to benzene and toluene. The mechanism of toluene and benzoic acid formation is studied by kinetic data and by comparing CO and CO_2 as possible sources for the extra carbon. It is concluded that PhS. and CO are the precursors to benzoic acid, toluene, thiophenol, and thioanisole. Formic acid reacts primarily via the metal surface of the reactor and most probably with radical initiation.

21257 The reactivity and composition of strongly adsorbed carbonaceous deposits on platinum. Model of the working hydrocarbon conversion catalyst. Davis, S.M.; Zaera, F.; Somorjai, G.A. (Univ. of California, Berkeley). *Journal of Catalysis;* **77**: No. 2, 439-459(Oct 1982). Contract W-7405-ENG-48.

The role of strongly adsorbed hydrocarbon deposits in reforming catalysis on a series of flat, stepped, and kinked platinum single-crystal surfaces at atmospheric pressures and temperatures between 300 and 700 K has been established and a model developed for the working structure and composition of the active catalyst surface. Restart reaction studies and reaction rate studies using platinum surfaces precovered with carbonaceous overlayers containing carbon-14 were used to investigate the catalytic activity and selectivity of carbon-covered platinum in hydrocarbon hydrogenation, dehydrogenation, and skeletal rearrangement. Quantitative hydrogen thermal desorption studies were carried out as a function of surface structure and reaction temperature to determine (1) the composition, and (2) the energetics for sequential dehydrogenation of carbonaceous deposits derived from a variety of adsorbed hydrocarbons including isobutane, neopentane, n-hexane, and cyclohexene. Carbon monoxide adsorption thermal desorption methods were developed to titrate uncovered platinum surface sites before and after reaction rate studies. The uncovered-site concentrations were correlated with the total surface carbon coverage as determined by Auger electron spectroscopy and the catalytic activity and selectivity of carbon-covered platinum. These experiments together with results from related structure sensitivity, thermal desorption, deuterium exchange, and radiotracer studies revealed that the primary role of the disordered carbon deposit is that of a nonselective poison which blocks platinum surface sites from incident reactant molecules.

21258 Extractable organic matter in municipal wastewaters. 2. Hydrocarbons: molecular characterization. Eganhouse, R.P.; Kaplan, I.R. (Univ. of California, Los Angeles). *Environmental Science and Technology;* **16**: No. 9, 541-551(Sep 1982).

Hydrocarbons isolated from southern California municipal wastewaters were analyzed by high-resolution gas chromatography and computer-assisted gas chromatography-mass spectrometry. Most of the hydrocarbons (56-77%) are not chromatographically resolvable and probably derive from petroleum products such as lubricating oils. Normal, iso-, and acyclic isoprenoid alkanes along with alkylcyclohexanes and numerous series of substituted benzenes and polycyclic aromatic hydrocarbons compose the major fraction of the resolvable hydrocarbons. Polycyclic terpenoids occur as trace constituents and appear also to be of ancient, not recent biosynthetic, origin. However, the virtual absence of 17α(H),18α(H),21β(H)-28,30-dinorhopane, a specific marker of California oils, indicates that locally produced petroleum is, at most, a minor contributor to these wastewaters. A homologous series of long-chain alkylbenzenes presumably derived from the LAS-type detergents was identified. These compounds seem to be abundant and ubiquitous domestic wastewater constituents that might be exploited as anthropogenic waste tracers in the marine environment.

21259 Simultaneous measurement of CO oxidation rate and surface coverage on Pt/Al_2O_3 using infrared spectroscopy: rate hysteresis and CO island formation. Haaland, D.M. (Sandia National Labs., Albuquerque, NM); Williams, F.L. *Journal of Catalysis;* **76**: No. 2, 450-465(Aug 1982). Contract AC04-76DP00789.

The catalytic oxidation of CO on a commercial Pt/Al_2O_3 catalyst has been studied at a total pressure of one atmosphere using Fourier transform infrared spectroscopy. Simultaneous measurements of steady-state reaction rates and CO surface coverages were obtained at temperatures between 460 and 520 K. During oxidation, the frequency of the infrared absorption peak of linear-bonded CO is invariant at 2081 cm^{-1} at 520 K over nearly a 100-fold change in CO surface coverage. This peak position is within 1 cm^{-1} of that found for saturation coverage in the presence of pure CO at one atmosphere. In contrast, under nonreactive desorption, large shifts in frequency are found as the CO surface coverage changes. The ratio of the intensities of the absorption bands due to both linear and bridge-bonded CO was constant during oxidation. These observations are interpreted as resulting from the formation of islands of CO during the oxidation reaction. Hysteresis in both CO reaction probability and CO surface coverage are found which are inversely related. Thus CO blocks active sites on the Pt for the reaction. The width and shape of the hysteresis loops as a function of temperature are qualitatively understood in terms of the rate of CO desorption from the Pt surface. At very high surface coverages, changes in the reaction probability are not accompanied by changes in adsorbed CO. This may be due either to the formation of surface species, unobserved in ir, which block the reaction or to the presence of a small number of very reactive Pt sites which are blocked with only a very small change in CO surface coverage.

21260 **Generation and characterization of ethylene glycol vapors and aerosols.** Cheng, Y.S.; Marshall, T.C.; Kanapilly, G.M. (Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM). *American Industrial Hygiene Association Journal;* No. 43, 250-253(Apr 1982). Contract AC04-76EV01013.

Methods for generating ethylene glycol vapors and aerosols for short-term animal inhalation exposures are described. Experimental conditions were established for stable vapor output by vaporizing ethylene glycol in a furnace. The vapor concentration, which was measured by three independent methods, increased with vaporization temperature (70 to 110°C) but leveled off at temperatures exceeding 110°C. The maximum concentration was around 310 μg of ethylene glycol per liter of air. This is close to the saturated ethylene glycol vapor concentration at room temperature and 620 Toor ambient pressure. No thermal decomposition products were detected. A vaporization-condensation method was used to form ethylene glycol droplets condensed on $^{67}Ga_2O_3$ nuclei which served as a gamma tracer for the droplets. Mass median aerodynamic diameters as determined by a Mercer impactor were about 1.2 μm.

21261 **Fluorogermanium(IV) salts of graphite. A system in equilibrium with elemental fluorine.** McCarron, E.M.; Grannec, Y.J.; Bartlett, N. (Lawrence Berkeley Lab., CA). *Journal of the Chemical Society, Chemical Communications;* **158**: 890-891(1980).

Pyrolytic graphite is not intercalated by GeF_4 alone but is intercalated by GeF_4-F_2 mixtures to yield, at the intercalation limit, at 20°C, a first-stage material, $C_{12}GeF$/sub 5-6/, which is in equilibrium with gaseous fluorine.

21262 **(AD-A—115149/7) Photoionization of molecular clusters. Final report 1 May 78-30 Sep 81.** Andres, R.P.; Calo, J.M. (Princeton Univ., NJ (USA). Dept. of Chemical Engineering). Dec 1981. 53p. NTIS, PC A04/MF A01.

An experimental apparatus consisting of a novel multiple expansion cluster source coupled with a molecular beam system and photoionization mass spectrometer has been designed and constructed. This apparatus has been thoroughly tested and preliminary measurements of the growth kinetics of water clusters and the photoionization cross section of the water dimer have been carried out.

21263 **(CONF-8103158—1) Primary events of photosynthesis.** Shipman, L.L. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 10p. NTIS, PC A02/MF A01. Order Number DE83007780.

From Workshop on molecular electronic devices; Washington, DC, USA (23 Mar 1981).

The primary events of photosynthesis are those photophysical and photochemical events that occur immediately after absorption of a photon by the photosynthetic pigments. The primary events include the migration of singlet excitons among the antenna pigments, exciton trapping by the reaction center, and a sequence of several electron transfer steps that leads to the formation of a stable electron-hole separation. All of the primary events occur within protein complexes which include chlorophylls, carotenoids, quinones, and various other transfer components. These complexes are called photosystems. Photosystems reside in a special photosynthetic membrane in organisms such as algae, higher plants, purple photosynthetic bacteria, and green photosynthetic bacteria. In this manuscript the primary events of photosynthesis are summarized with particular attention to the principles that they might hold for the design of molecular electronic devices.

21264 **(CONF-8103158—2) Two-electron gates in photosynthesis.** Shipman, L.L. (Argonne National Lab., IL (USA)). 1981. 6p. NTIS, PC A02/MF A01. Order Number DE83007779.

From Workshop on molecular electronic devices; Washington, DC, USA (23 Mar 1981).

Principals underlying the design of naturally occurring electron gates in the photosynthetic apparatus of green plants and photosynthetic bacteria are discussed and related to molecular electronics. A pair of quinones participates in election transfer on the reducing side of photosystem II of green plants and the photosystem found in purple photosynthetic bacteria. The quinones are photochemically reduced by electron transfers from the primary events of photosynthesis. In each quinone, there are 2 binding sites, Q1 and Q2. The quinones Q1 and Q2 are non-covalently bound to intrinsic membrane protein. Also, in both systems there is a pool of quinones of the same chemical structure which are outside the photosystem, but reside in the same membrane. Protons move from aqueous solution outside the photosynthetic membrane onto the quinone-protein complex as electrons are pumped to the quinones. The rate of proton uptake is almost two-orders of magnitude slower than electron transfer rate. Electron transfer from Q1 to Q2 is temperature dependent. Problems arising in biomimetic molecular systems are discussed. (DMC)

21265 **(DOE/ER/03569—T2) Gas-phase radiolysis and vacuum-ultraviolet photolysis of heterocyclic organic compounds.** Scala, A.A. (Worcester Polytechnic Inst., MA (USA). Dept. of Chemistry). 1982. Contract AC02-76ER03569. 20p. NTIS, PC A02/MF A01. Order Number DE83007850.

The long-range objective of our research group is to gain a better understanding of the processes by which complex organic molecules react when they absorb large amounts of energy. This progress report describes the results of our recent work in three areas: A. Vacuum-Ultraviolet Photolyses; B. Ion-Molecule Reactions in Gaseous vs. Solution Phase; C. Structure-Reactivity Correlations in Ion-Molecule Reactions of Organic Heterocycles. 6 tables.

21266 **(DOE/ER/04380—6) Formation of fuel via photochemical electron transfer. Progress report, February 1, 1982-January 31, 1983.** Jones, G. II. (Boston Univ., MA (USA). Dept. of Chemistry). 25 Jan 1983. Contract AC02-77ER04380. 21p. NTIS, PC A02/MF A01. Order Number DE83007147.

Current research is devoted to photo-induced electron transfer reactions which have particular relevance to the generation of fuels or useful chemicals, potentially using sunlight as a radiation source. Results from the following studies are given: a comparison of electron transfer yield as a function of charge type in ruthenium (II) complexes and methyl viologen analogs; ionic photodissociation of visible absorbing CT complexes of methyl viologen (MV^{2+}); dioethers as electron transfer agents; simulated temperature dependence of quantum yields for photoreactions involving energy or electron transfer; and effects of ultra-high magnetic fields on intramicellar radical pair dynamics in amphiphilic media.

21267 **(EUR—7678-EN) Kinetic factors controlling the yield of photosystem II and O_2 emission.** Lavorel, J.; Maison, B. (Commission of the European Communities, Luxembourg). 1982. 47p. Available from the Commission of the European Communities, Luxembourg.

In the present paper, three topics have been studied: The first and the second (misses and deactivation) are dealing with kinetic properties of the so called OES (i.e. oxygen evolving system) of photosynthesis which may limit its efficiency for photoconversion applications. The third (dark luminescence) is a new phenomenon which may contribute to a better understanding of OES.

21268 **(EUR—7679-EN) Study of primary reactions of photosynthesis in green plants by rapid flash absorption spectroscopy.** Mathis, P.; Conjeaud, H.; Reinman, S.; van Best, J. (Commission of the European Communities, Luxembourg). 1982. 48p. Available from the Commission of the European Communities, Luxembourg.

We have applied the method of flash absorption spectroscopy to improve our understanding of the primary processes of photosynthesis in green plants. Part of our effort has been devoted to the realization of new ensembles of photodetectors (silicium photodiodes) and amplifiers which represent an important improvement over our past equipment. The photochemistry of the Photosystem-1 reaction center leads to the reduction of strong reductants, which are arranged as a chain of carriers. The sequence of electron acceptors has been studied. At physiological temperatures we have shown that two acceptors (A_1, A_2) are more primary that the species P-430. We showed that P-430 has a 2-e-capacity. The kinetics of reaction have also been studied at low temperature. A_2 is probably the species named X, known from low-temperature EPR experiments. A_1 is still chemically unknown. The Photosystem-2 reaction center is directly responsible for the photosynthetic oxygen evolution. We studied a few properties of P-680 (photoactive chlorophyll a complex) and its immediate donor D1 which is connected to the oxygen evolving complex. The kinetic behaviour of P-680$^+$ has been conveniently studied by following absorption changes at 820 nm. In physiological conditions, D_1 reduces P-680$^+$ in less than a microsecond (30 ns after dard-adaptation). Inhibition of O_2-evolution leads to a much slower, pH-dependent, reduction of P-680$^+$ either by D_1 (2-40 μs) or by electron return from the primary plastoquinone PQ_1 (150 μs). D_1 has a one-electron capacity. Measurements of the electrochromism of carotenoids led us to conclude that P-680 and D_1 are located at the internal side of the thylakoid membrane.

21269 **(EUR—7682-EN) Photochemical dissociation of water by means of visible light.** Harriman, A.; Porter, G. (Commission of the European Communities, Luxembourg). 1982. 142p. Available from Commission of the European Communities, Luxembourg.

Photosynthesis provides the only practical solution for the collection and storage of solar energy. This is achieved by coupling together two photoreactions; one reaction reduces CO_2 to the level of carbohydrate whilst the second reaction leads to the oxidation of water to molecular oxygen. This second step is of great current interest since, by itself, it is capable of storing solar energy in the form of a chemical fuel. Although the detailed mechanism of this second reaction is far from clear, it is believed that a manganese complex acts as the active catalyst for oxidation of water whilst chlorophyll acts as the photosensitiser.

21270 **(EUR—7687-EN) Photochemical dissociation of water adsorbed in artificial membranes made from phyllosilicates.** Fripiat, J.J.; Abdo, S. (Commission of the European Communities, Luxembourg). 1982. 66p. Available from the Commission of the European Communities, Luxembourg.

The objective of this work is to construct a purely artificial solid-state system able to dissociate water photochemically with solar light, at the gas-solid interface. The mechanism by which this is hoped to be achieved is directly related to the natural or semiartificial photosynthetic systems and can be described in four basic steps: - capture of solar photons by a pigment and generation of an excited state - conversion of this electronic energy into transient electrochemical energy by electron transfer from the excited pigment to an acceptor - conversion of this transient electrochemical energy into stored chemical energy through the production of hydrogen and oxygen.

21271 **(LBL—15480) Molecular-beam studies of primary photochemical processes.** Lee, Y.T. (Lawrence Berkeley Lab., CA (USA)). Dec 1982. Contract AC03-76SF00098. 16p. (CONF-830128—1). NTIS, PC A02/MF A01. Order Number DE83006190.

From International conference on photochemistry and photobiology; Alexandria, Egypt (5 Jan 1983).

Application of the method of molecular-beam photofragmentation translational spectroscopy to the investigation of primary photochemical processes of polyatomic molecules is described. Examples will be given to illustrate how information concerning the energetics, dynamics, and mechanism of dissociation processes can be obtained from the precise measurements of angular and velocity distributions of products in an experiment in which a well-defined beam of molecules is crossed with a laser.

21272 **(NP—3901014) Direct investigation of hydrogen chloride elimination from 1,2-dichlorothane by laser induced radical chain reactions.** Schneider, M. (Max-Planck-Institut fuer Stroemungsforschung, Goettingen (Germany, F.R.)). Dec 1981. 66p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE83901014.

The elimination of hydrogen chloride from 1,2 dichlorethane which proceeds as a chain reaction, has been studied in a flow reactor at temperatures between 520-720 K and pressures from 60 to 600 torr. The chain reaction has been initiated by KrF$^-$ laser photolysis of dichlorethane. Measurements of the UV-absorption spectra temperature dependence are presented for dichlorethane and the products vinylchloride and hydrogen chloride in the temperature range 300-770 K. At these temperatures an absorption enhancement of dichlorethane of three orders of magnitude is observed for a photolysis wavelength of 248 nm (KrFsup(*)). The quantum yield oe of the chain reaction has been determined in the flow reactor and in a static cell. For a constant rate the quantum yield follows an Arrhenius law in the temperature range 520-720 K, with an activation energy of 53 kJ/mol. By variation of the laser energy a decrease in quantum yield is observed proportional with the square root of the initial radical concentration. The kinetics of the system has been simulated and a good agreement between the calculated and measured concentration-time-profiles is obtained. Based on this simulation predictions can be made for the reaction behaviour and the quantum yield in temperature and pressure regions outside the experimental conditions.

21273 **(SAND—82-3002C) Surface chemical information from electron- and photon-stimulated desorption.** Knotek, M.L. (Sandia National Labs., Albuquerque, NM (USA)). 1982. Contract AC04-76DP00789. 45p. (CONF-8209101—1). NTIS, PC A03/MF A01. Order Number DE83007367.

From Inelastic ion, surface collision conference; Middlefart, Denmark (21 Sep 1982).

Electron- and Photon-Stimulated Desorption can provide atomic and structural information on the chemical state of surfaces and adsorbates on surfaces. Information is contained in the variation of desorption yield with chemical state, ion energy distributions, ion angular distributions, and in desorption thresholds and spectral dependence. Current models for desorption discuss both ionic and covalent systems and provide considerable insight into the environment of desorbing species. Widely studied examples include oxygen on metals, CO on metals, hydrogen on metals and semiconductors, and cryogenic molecular solids as models for desorption. All of theses systems show variations in ion yield with chemical state of the desorbing species which in many cases fit existing models but in some cases suggest new mechanisms of desorption. Ion energy and angular distribution provide signatures of the type of state yielding desorption and the local structure of the desorption site. Desorption spectra can provide electronic and structural details of the bonding site from the analysis of near edge and extended fine structure. Near edge structure can also be used as a signature by comparison to systems of known chemical environment. The above examples of the combined use of the different variations of the desorption experiment are discussed. 115 references, 7 figures.

21274 **Investigation of the properties of the primary electron acceptor complex of photosystem I.** Evans, M.C.W.; Heathcote, P.; Nugent, J. Luxembourg; Commission of the European Communities (1982). 61p. (EUR—7683-EN). .

There are two groups of photosynthetic organisms, the photosynthetic bacteria with a single photochemical system which functions with a redox range of +500 to -600 mV and the oxygen evolving organism with two photosystems with an overall redox range of +1000 mV to about -900 mV. The bacterial system is the best understood but it seems likely that eventually the plant system will be of most interest because it has the ability to use water as electron donor and produce a reductant able to reduce protons to hydrogen. This process however is very complicated and involves two photochemical systems. One of these (Photosystem 2) produces the oxidant which oxidises water and a reductant at about 0 mV. The other (Photosystem I) oxidises this reductant at about 0 mV. The other (Photosystem I) oxidises this reductant and produces a low potential reductant, which is used by the plant to fix CO_2, but which could possibly be used for hydrogen production. The work described in this report has been mainly concerned with the mechanism of photosystem I and in particular with composition of the electron acceptor system.

21275 **Photolysis of 1-iodopropane.** Carr, R.W. Jr.; Topor, M.G. (Univ. of Minnesota, Minneapolis). *Journal of Photochemistry;* **16**: 51-65(1981). Contract AC02-76ER02026.

Photodissociation of 1-iodopropane vapor was studied at 265, 236.5, 222.4 and 214 nm. In all cases highly vibrationally excited n-propyl radicals were formed. Excited n-propyl radical dissociation to methyl radicals and ethylene was observed at all wavelengths shorter than 265 nm; evidence was obtained for a dissociation pathway of lesser significance to hydrogen atoms and propylene. Model calculations indicated that the photodissociation occurs by an impulsive mechanism and that a population inversion of I(^{2}/sub 1/2/) and I(^{2}P/sub 3/2/) occurs at all wavelengths. Furthermore, the calculations suggest that the inversion is smaller at 214 nm than at wavelengths which are in the 1-iodopropane A band. 6 figures, 2 tables.

21276 **(BMFT-FB-T—81-122-VOL-1) Crosslinking of polyolefin insulation of cables and insulated wires by the use of energy-rich radiation. Part 1: material of irradiation. Final report, March 1980.** Pieper, D.; Schillmoeller, A. (Siemens A.G., Neustadt b. Coburg (Germany, F.R.)). Jul 1981. 173p. (In several languages). NTIS, PC A08/MF A01.

Bundesminesterium fuer Forschung und Technologie REFS Sponsored by Bundesministerium fuer Forschung und Technologie.

Polyolefins were selected that are crosslinkable by radiation including the copolymers of ethylene and polyolefin elastomer blends. Effective stabilizing systems against thermo-oxidative ageing and copper-catalized oxidation were developed. The influence of crosslink-reforcing, coagents fillers, and pigments was studied. For the materials XLPE, EPR and EVA the optimization of compounds in a scope of production trials resulted in useful proposals for solutions for 1kV insulating compounds.

21277 **(BMFT-FB-T—81-124-VOL-3) Crosslinking of polyolefin insulations of cables and insulated wires by the use of energy-rich radiation. Part 3: production engineering. Final report, March 1980.** Bickel, H.D.; Heublein, H.; Weber, D. (Siemens A.G., Neustadt b. Coburg (Germany, F.R.)). Jul 1981. 224p. (In several languages). NTIS, PC A10/MF A01.

Bundesministerium fuer Forschung und Technologie REFS Sponsored by Bundesministerium fuer Forschung und Technologie.

Crosslinking of the PE insulations of electrical conductors by means of electron beams represents a perfect alternative to existing thermic and chemical procedures. From projecting-up to running-in of the plant there were no difficulties of general nature. For an essential range of products the most important production parameters could be determined. Some problems occuring during the radiation of products, such as straightening of the conductor, nonperformance of the exactly specified adhesion power of the insulation to the conductor and non-uniform thickness of insulation could be eliminated by an optimization of the concerned parts of the plant. With the exception of three greater repairs within 4 years, up to now no defects were to be observed in the radiation plant. Heavy corrosion in the radiation part by ozone and nitrogen oxides in the beginning was reduced to an acceptable degree by suitable measures.

21278 **(CONF-8109205—1) Structure and dynamics of paramagnetic transients by pulsed EPR and NMR detection of nuclear resonance.** Trifunac, A.D. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 16p. NTIS, PC A02/MF A01. Order Number DE83007707.

From NATO Advanced Study Institute conference on fast processes and labile species in chemistry and molecular biology using ionizing radiation; Capri, Italy (7 Sep 1981).

Structure and dynamics of transient radicals in pulse radiolysis can be studied by time resolved EPR and NMR techniques. EPR study of kinetics and relaxation is illustrated. The NMR detection of nuclear resonance in transient radicals is a new method which allows the study of hyperfine coupling, population dynamics, radical kinetics, and reaction mechanism. 9 figures.

21279 **(CONF-8109205—3) EPR and NMR detection of transient radicals and reaction products.** Trifunac, A.D. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 16p. NTIS, PC A02/MF A01. Order Number DE83007802.

From NATO Advanced Study Institute conference on fast processes and labile species in chemistry and molecular biology using ionizing radiation; Capri, Italy (7 Sep 1981).

Magnetic resonance methods in radiation chemistry are illustrated. The most recent developments in pulsed EPR and NMR studies in pulse radiolysis are outlined with emphasis on the study of transient radicals and their reaction products. 12 figures.

21280 **(CONF-8109205—4) Radical ions and excited states in radiolysis. Optically detected time resolved EPR.** Trifunac, A.D.; Smith, J.P. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 9p. NTIS, PC A02/MF A01. Order Number DE83007868.

From NATO Advanced Study Institute conference on fast processes and labile species in chemistry and molecular biology using ionizing radiation; Capri, Italy (7 Sep 1981).

Excited-state production and radical-ion recombination kinetics in pulse-irradiated solutions of aromatic solutes in cyclohexane are studied by a new method of optical detection of time-resolved electron paramagnetic resonance (EPR) spectra. 7 figures.

21281 **(CONF-8109205—5) Use of pulse radiolysis to study transient species in the gas phase.** Sauer, M.C. Jr. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 26p. NTIS, PC A03/MF A01. Order Number DE83007828.

Examples are chosen from the leterature to show the types of species which have been investigated in the gas phase using the pulse radiolysis technique. The types of processes occurring in pure rare gases and rare gases containing additives are examined. Techniques used to study ion-recombination processes, ion-molecule reactions, and electron capture reactions are discussed and examples of typical results are given. The use of pulse radiolysis to determine rate constants for reactions of atoms and free radicals is also examined. 21 figures, 3 tables.

21283 (MPQ—57) IR laser induced reactions: temperature distributions and detection of primary products. Bachmann, F. (Max-Planck-Institut fuer Quantenoptik, Garching (Germany, F.R.)). Dec 1981. 195p. (In German). NTIS (US Sales Only), PC A09/MF A01. Order Number DE83750193.

The products of laser-driven pyrolysis in the gas phase often differ drastically from those of conventional pyrolysis. In this work some reasons for this behaviour are considered. First, temperature distributions in cylindrical cells, filled with SF_6 at low pressure and heated by cw CO_2 laser radiation, are calculated by a simple model. The influence of convection is not taken into account. Comparison of theoretical prediction and corresponding experiments included the temperature-dependent absorption cross section. In the second part we describe a molecular-beam sampling system for real time monitoring of primary products in laser-driven reactions. With this system initial tests were made in nonreacting SF_6/rare-gas mixtures. The influence of thermal diffusion was indicated by changes in concentration when the laser was switched on and off. A theoretical treatment is given solving the time-dependent heat-conduction and diffusion equation numerically. As an example for reacting systems, the laser-driven pyrolysis of methanol with SF_6 as an absorber was studied.

21284 (NASA-CR—169000) Poly(aryl ethers) and related polysiloxane copolymer molecular coatings: preparation and radiation degradation. Final report. Mcgrath, J.E. (Virginia Polytechnic Inst. and State Univ., Blacksburg (USA)). May 1982. 27p. NTIS, PC A03/MF A01.

REFS.

The radiation degradation of poly(arylene ether sulfones) and related materials is studied. These basic studies are important both as a means to developing stronger, more stable matrix resins for composite materials, as well as to improve the data base in regard to chemical structure-physical property relationships. Thirty homo and copolymers were synthesized, at least partially characterized and, in several cases suitable film casting techniques were developed. Four samples were chosen for initial radiation degradation. Poly(dimethyl siloxane) soft bocks/segments can preferentially migrate to the surface of copolymer films. Since siloxanes are utilized as thermal control coatings, this form of 'molecular' coating is of interest. The chemistry for preparing such copolymers with any of the polymers described was demonstrated.

21285 (NDRL—2410) University of Notre Dame Radiation Laboratory quarterly report, October 1, 1982-December 31, 1982. (Notre Dame Univ., IN (USA). Radiation Lab.). 1 Feb 1983. Contract AC02-76ER00038. 47p. NTIS, PC A03/MF A01. Order Number DE83006575.

Abstracts are presented of 63 reports in the fields of radiolysis, radiation chemistry, photolysis, and photochemistry. (DLC)

21286 Bibliographies on radiation chemistry. 7. Triplet-triplet absorption spectra: Pt. B (1976 - April, 1982). Carmichael, I.; Hug, G.L. (Notre Dame Univ., IN (USA). Radiation Lab.). *Radiation Physics and Chemistry;* **20**: No. 3, 179-197(1982).

We have compiled a bibliography of papers dealing with triplet-triplet absorption spectroscopy which we hope is reasonably complete through April 1982. The number of references (about 800) has mandated the separation of this list into two parts. Part A included work published before 1976; Part B from then until the above cutoff date. The initial set of references for the current period was obtained as a subset of a profile on transient spectra. The keywords (and logic) chosen were (triplet state and absorption spectra) or triplet-triplet absorption or triplet-triplet transition. Further references were secured from the biologically oriented review of Bensasson et al. We have included only those papers providing quantitative spectral information such as peak locations and extinction coefficients. Studies in which the observation of a known triplet-triplet absorption is used simply as a kinetic tool have generally been omitted. Work in the gas phase has been excluded and we have not covered the theoretical aspects of the phenomenon. The exact identity of the metastable absorber in coordination compounds is generally uncertain and these have also been excluded from consideration although studies on chlorophylls and porphyrins have been retained.

21287 Electron reactions in the pulse radiolysis of metal carbonyls dissolved in 2,2,4-trimethylpentane. Kang, Y.S. (Jackson State Univ., MS (USA)); Holroyd, R.A. (Brookhaven National Lab., Upton, NY (USA)). *Radiation Physics and Chemistry;* **20**: No. 3, 237-240(1982).

The role of electron reactions in the radiolysis of solutions of chromium, molybdenum and tungsten carbonyls in 2,2,4-trimethylpentane was investigated. These compounds are very reactive with the electron and observed rate constants for attachment are: 7,8 and 5 x 10^{13} M^{-1} sec^{-1} for Cr, Mo and W hexacarbonyls, respectively. The spectra of the metal carbonyl anions were studied by both pulse radiolysis and laser photodetachment methods. The data indicate that there is a maximum in the absorption spectra of $Mo(CO)_6^-$ at 412 nm and that the anions of the other hexacarbonyls also absorb in this region. Photodetachment from $M(CO)_6^-$ occurs throughout the visible with thresholds in the IR. The electron affinities of the metal carbonyls are obtained from 3/2's power law plots of the cross section data.

21288 ESR and pulse radiolysis investigation of the radiolysis of sodium vinyl sulfonate. Behar, D.; Fessenden, R.W.; Hornak, J.P. (Notre Dame Univ., IN (USA). Radiation Lab.; Notre Dame Univ., IN (USA). Dept. of Chemistry). *Radiation Physics and Chemistry;* **20**: No. 4, 267-273(1982).

The kinetics of a number of radical reactions involving sodium vinyl sulfonate (SVS) have been studied by pulse radiolysis methods. The initial rate of polymerization of SVS was determined directly by observing the decay of the ESR signal of $HOCH_2CHSO_3^-$ in its reaction with SVS monomer. A rate constant of 7 x 10^4 M^{-1} s^{-1} was found. The same value was found here for acrylate. Reactions of SVS with the primary radicals produced by radiolysis of water were studied by optical absorption methods. Both OH and O^- add to the double bond with rate constants of (3.5 +-0.5) x 10^9 and (3.4 +- 0.5) x 10^8 M^{-1} s^{-1}, respectively. The hydrated electron adds to the double bond with a rate constant of (2.2 +- 0.2) x 10^9 M^{-1} s^{-1}. The electron adduct protonates on carbon to yield $CH_3CHSO_3^-$, the same radical as produced by H atom addition. Steady-state ESR experiments confirm the production of $CH_3CHSO_3^-$ from e^- sub(aq). ESR spectra of the radical adducts $XCH_2CHSO_3^-$ with X = H, OH, CO_2^-, SO_3^- and SO_4^- were obtained in steady-state radiolysis experiments and the magnetic parameters determined.

21289 (ANL/NESC—321) EXPALS; least squares exponential decay curves. Gardner, C.D. (Lawrence Livermore National Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048321.

Generally, it is desirable to have at least 10n observations where n equals the number of terms and to input k+n significant figures if k significant figures are expected.

This program fits by least squares a function which is a linear combination of real exponential decay functions. The function is y(k) = summation over j of a(j) * exp(-lambda(j) * k). Values of the independent variable (k) and the dependent variable y(k) are specified as input data. Weights may be specified as input information or set by the program (w(k) = 1/y(k)).CDC7600,6600; FORTRAN IV; SCOPE 2.1; EXPALS requires about 74,062 (octal) words with the maximum number of observations or interpolated values (MMX) set at 200 and the maximum number of values for the lambda calculation (NMX) set at 25.

21290 **(ANL/NESC—322) ISOSEARCH; isotope production flux, cross section calculations.** Friend, C.W.; Lewis, R.E. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048322.

The program was developed to calculate the unknown reaction cross section, flux value, or product activity in an isotope-production scheme consisting of two or three nuclides.IBM360; FORTRAN IV and BAL.

21291 **(ANL/NESC—324) FRANTIC; least squares fit sum of exponentials.** Strecok, A.J. (Academy of Natural Sciences of Philadelphia, PA (USA). Dept. of Limnology). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048324.

The program is designed to accommodate up to 400 data points for a maximum of 10 component .

FRANTIC is designed to process raw counting data and to fit in the least squares sense these data to the multiple exponential growth and decay equations. The program can be used for sums of exponentials with positive, negative, or zero exponents and positive or negative coefficients.IBM370; FORTRAN IV; OS/370; FRANTIC uses approximately 180K bytes of storage for execution.

21292 **(CONF-8209103—1) New calorimetric studies of inorganic fluorine compounds.** O'Hare, P.A.G.; Flotow, H.E.; Appleman, E.H.; Malm, J.G. (Argonne National Lab., IL (USA)). Apr 1982. Contract W-31-109-ENG-38. 2p. NTIS, PC A02/MF A01. Order Number DE83007677.

From IUPAC conference on thermodynamics; London, UK (7 Sep 1982).

In this paper, recently determined enthalpies of formation are presented for two fluorides, silver(I) uranium(V) fluoride, $AgUF_6$, and cesium fluoroxysulfate, $CsSO_4F$. In addition the derivation of entropy is presented for $CsSO_4F$.

21293 **Method for the preparation of radon-211.** Lambrecht, R.M.; Meyer, G. (to Dept. of Energy). US Patent 4,364,898. 21 Dec 1982. Filed date 10 Oct 1980. vp.

REFER ALSO TO CITATION(S) 19635, 20867, 21283

21294 **(AD-A—118383/9) Temperature profile of a stoichiometric ch4/N2O flame from laser excited fluorescence measurements on OH.** Anderson, W.R.; Decker, L.J.; Kotlar, A.J. (Army Armament Research and Development Command, Aberdeen Proving Ground, MD (USA). Ballistics Research Lab.). Jul 1982. 45p. NTIS, PC A03/MF A01.

The temperature profile of a stoichiometric CH_4/N_2O flame over a porous plug, atmospheric-pressure burner has been measured using laser excited fluorescence of the OH radical. The technique of rotationally resolved fluorescence excitation scans was extended to the (1,1) vibrational band of the A doublet sigma plus - X doublet pi system to avoid problems of laser beam depletion and self-absorption encountered by this group and previous workers using the (O,O) band. Absorption spectra were obtained in addition to fluorescence spectra. A least squares curve-fitting technique which accounts for the various types of line broadening was developed and applied to two absorption lines in the (O,O) band. The resulting temperature profile is compared to that from fluorescence data reduced using Boltzmann plots. The more complicated curve-fitting approach was later applied to five lines in the spectrum using several combinations of fluorescence and absorption data. Results of all the aforementioned methods were compared to those from OH band reversal and N2 vibrational Raman measurements at the same point in the post flame gases. Excellent agreement was achieved. The results are discussed with emphasis on both the fluorescence diagnostics and the characteristics of the CH_4/N_2O flame on the porous-plug burner.

21295 **(DOE/ER/04939—5) Measurement of radical species concentrations and polycyclic aromatic hydrocarbons in flames by fluorescence and absorption using a tunable dye laser. Progress report, March 1, 1982-February 28, 1983.** Salmon, J.T.; Lucht, R.P.; Ludington, P.D.; Sweeney, D.W.; Laurendeau, N.M. (Purdue Univ., Lafayette, IN (USA). School of Mechanical Engineering). Mar 1983. Contract AC02-78ER04939. 9p. NTIS, PC A02/MF A01. Order Number DE83007983.

The primary goal of this research is to develop quantitative laser fluorescence methods for measuring the concentrations of radical species and polycyclic aromatic hydrocarbons (PAH's) in flames. The accuracy of the fluorescence techniques is evaluated through comparison with independent diagnostic methods. The applicability of the techniques over a range of flame conditions is evaluated by performing the fluorescence experiments in a flat flame burner operated at a variety of flame pressures, temperatures and equivalence ratios. Previously we have reported the demonstration of quantitative laser-saturated fluorescence (LSF) measurements of OH concentration in flames over wide ranges of flame pressure and stoichiometry and described preliminary results for naphthalene and anthracene fluorescence. Since the last report we have: (1) extended the OH analysis to atmospheric pressure methane-air flames under both clean and sooting conditions; (2) conducted LSF measurements of NH in a subatmospheric methane-nitrous oxide flame; (3) developed a technique for measuring the concentrations of PAH's in vapor state mixtures; and (4) detected hydrogen atom fluorescence in a flame for the first time using a two-photon absorption process. 4 figures.

21296 **(DOE/PC/30292—8) Synthetic-fuel combustion: pollutant formation. Soot-initiation mechanisms in burning aromatics. Final report, 19 September 1980-18 September 1982.** Rawlins, W.T.; Tanzawa, T.; Schertzer, S.P.; Krech, R.H. (Physical Sciences, Inc., Andover, MA (USA)). Jan 1983. Contract AC22-80PC30292. 155p. NTIS, PC A08/MF A01. Order Number DE83005611.

This report describes experimental studies of soot initiation in the pyrolysis and combustion of the aromatic model fuels toluene and pyridine. These molecules were chosen as generic examples of the aromatic component of synthetic fuels which is thought to dominate soot formation in combustion of these fuels. The experiments were conducted in a shock tube over the ranges 1300 to 2500°K and 0.2 to 0.8 atm, using optical diagnostics to monitor the appearance of soot particles and the kinetic behavior of several gas phase species. Major results of this study include (1) validation of the applicability of optical diagnostics in sooting systems; (2) observations of strong influence of fuel molecular structure on sooting behavior; and (3) postulation of a conceptual sooting mechanism to account for the existing data base. 66 figures, 6 tables.

21297 **(N—82-23466) Numerical methods and calculations for droplet flow, heating and ignition.** Dwyer, H.A.; Sanders, B.R.; Dandy, D. (California Univ., Davis (USA). Dept. of Mechanical Engineering). Mar 1982. 8p. (CONF-811174—). NTIS, PC A17/MF A01.

From 2. convention of the international colloquium on drops and bubbles; Monterey, CA, USA (19 Nov 1981).

In JPL proceedings of the 2nd International Colloquium on Drops and Bubbles, March 1982, pp 358-365 see N82-23418.

A numerical method was devised and employed to solve a variety of problems related to liquid droplet combustion. The basic transport equations of mass, momentum and energy were formulated in terms of generalized nonorthogonal coordinates, which allows for adaptive griding and arbitrary particle shape. Example problems are solved for internal droplet heating, droplet ignition and high Reynolds number flow over a droplet.

21298 (N—8228576) A comprehensive model to determine the effects of temperature and species fluctuations on reaction rates in turbulent reacting flows. Chinitz, W.; Foy, E.; Rowan, G.; Goldstein, D. (Cooper Union, New York, NY). Jul 1982. 64p. (NASA-CR—169124). NTIS, PC A04/MF A01.

The use of probability theory to determine the effects of turbulent fluctuations on reaction rates in turbulent combustion systems is briefly reviewed. Results are presented for the effect of species fluctuations in particular. It is found that turbulent fluctuations of species act to reduce the reaction rates, in contrast with the temperature fluctuations previously determined to increase Arrhenius reaction rate constants. For the temperature fluctuations, a criterion is set forth for determining if, in a given region of a turbulent flow field, the temperature can be expected to exhibit ramp like fluctuations. Using the above results, along with results previously obtained, a model is described for testing the effects of turbulent fluctuations of temperature and species on reaction rates in computer programs dealing with turbulent reacting flows. An alternative model which employs three variable probability density functions (temperature and two species) and is currently being formulated is discussed as well.

21299 (N—8230219) OD3P report. Status report. Hunter, S.C. (KVB, Inc., Irvine, CA (USA)). Mar 1982. 18p. KVB, Inc., Irvine, CA.

The numerical method was modified in a manner that substantially improved the accuracy of gas-phase kinetic reaction and gas-particle velocity and thermal lags, meeting the program objectives of conservation errors of less than 0.1 percent, while at the same time reducing the computer time required. These improvements and better method for starting conditions at the nozzle inlet, based on particle asymptotic fractional lag are discussed.

21300 (PB—82-238452) Quantification of fire properties of fuels and interaction with fire environment. Technical report. Tewarson, A. (Factory Mutual Research Corp., Norwood, MA (USA)). Jun 1982. 39p. NTIS, PC A03/MF A01.

Concepts for the quantification of fire properties of fuels and interaction with fire environments are presented. It is shown that certain fire properties, i.e., actual heat of combustion and yield of fire products, are independent of fire size as long as the fire remains overventilated. Small-scale measurements of asymptotic values of generation rates of fuel vapors and fire products, per unit area of fuel, obtained by oxygen enrichment, are shown to agree reasonably well with the generation rates measured directly on a large scale in ambient air.

21301 (PB—83-107813) Combustion research needs. Smoot, L.D.; Hill, S.C. (Brigham Young Univ., Provo, UT (USA). Dept. of Chemical Engineering). Mar 1982. 90p. NTIS, PC A05/MF A01.

A six-month study to survey the state-of-the-art in combustion research is summarized. Included is a review of the literature and discussions on coal gasification, explorations, fires, liquid and solid fossil fuels, reciprocating and turbine engines, and solid propellants. Fundamental combustion areas are examined, including the chemistry of combustible materials, combustor modeling, diagnostics and instrumentation, droplet and gas phase kinetics, and fluid mechanics. Results are presented of a survey of professionals who recommended research needs in the areas of turbulence/fluid mechanics, diagnostics/instrumentation, and combustor modeling. Evaluations of this document by two combustion researchers are included.

21302 (SAND—83-8208) Fundamental combustion and diagnostics research at Sandia. Progress report, October-December 1982. Mattern,, P.L.; Gusinow, M.A. (Sandia National Labs., Livermore, CA (USA)). Feb 1983. Contract AC04-76DP00789. 60p. NTIS, PC A04/MF A01. Order Number DE83008258.

The Department of Energy/Office of Basic Energy Sciences, through the Division of Chemical Sciences/Fundamental Interactions Branch, has established a Combustion Research Facility at Sandia National Laboratories, Livermore, California. The long-term research carried out at this Facility emphasizes fundamental studies which have the potential to impact practical combustion. A special emphasis is given to the development and application of advanced research methods, taking advantage of the latest progress in laser and computer technologies. Included here are quarterly reports on the research sponsored by the Division of Chemical Sciences/Fundamntal Interactions Branch. The first section presents progress on flame research, the second section details researdh in combustion chemistry and modeling, the third section describes rreesults in diagnostics research, and the fourth section provides technical highlights on resources develped and made available at the Combustion Research Facility.

42 ENGINEERING

4201 General Engineering

21303 (NP—3901368) Report for 1979-1980, 1980-1981 of the Division of Engineering and Applied Science at the California Institute of Technology. (California Inst. of Tech., Pasadena (USA)). 1981. 154p. CALTECH, California Inst. of Tech., 1201 East California Boulevard, Pasadena 91125.

This volume discusses new activities at the Division of Engineering and Applied Science at Caltech, lists its Sherman Fairchild Distinguished Scholars and all instructional staff, and reports on research projects in the following subject areas: aeronautics; applied mathematics; mechanical civil, electrical and environmental engineering; materials science; applied and biofluid mechanics; materials science; applied physics; bioinformation systems; and computer science. (LCL)

4202 Facilities And Equipment

21304 (AD-A—115170/3) 200 kj copper foil fuses. Final report. McClenahan, C.R.; Goforth, J.H.; Degnan, J.H.; Henderson, R.M.; Janssen, W.H. (Computer Sciences Corp., Albuquerque, NM (USA)). Apr 1980. 59p. NTIS, PC A04/MF A01.

A 200-kJ, 50-kV capacitor bank has been discharged into 1-mil-thick copper foils immersed in fine glass beads. These foils ranged in length from 27 to 71 cm and in width from 15 to 40 cm. Voltage spikes of over 250 kV were produced by the resulting fuse behavior of the foil. Moreover, the current turned off at a rate that was over 6 times the initial bank dI/dt. Full widths at half maxima for the voltage and dI/dt spikes were about 0.5 microsec, with some as short as 300 nanosec. Electrical breakdown was prevented in all but one size fuze with maximum applied fields of 7 kV/cm. Fuses that were split into two parallel sections have been tested, and the effects relative to one-piece fuses are much larger than would be expected on the basis of inductance differences alone. A resistivity model for copper foil fuses, which differs from previous work in that it includes a current density dependence, has been devised. Fuse behavior is predicted with reasonable accuracy over a wide range of foil sizes by a quasi-two-dimensional fuse code that incorporates this resistivity model. A variation of Maisonnier's method for predicting optimum fuze size has been derived. This method is valid if the risetime of the bank exceeds 3 microsec, in which case it can be expected to be applicable over a wide range of peak current densities.

21305 (AD-A—115516/7) Soft photon effects on vacuum power flow. Master's thesis. Mitchell, O.J.; Blaher, R.J. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Dec 1981. 62p. (AFIT/GE/EE—81D-12). NTIS, PC A04/MF A01.

Understanding the physical processes of high power electrical energy is of major importance for the advancement of state-of-art directed energy, simulation and confined fusion programs. Generation of high voltage, short duration pulses may result in high energy density plasma which produces quantities of VUV and soft

X-ray photons in the range of 0.15-10 ev. Power transport down vacuum lines presents two problems which must be dealt with in every application-insulator flashover and electrode gap closure. The pulsed flashover and ablative closure mechanisms under soft VUV photon fluence are described. Two tests were conducted. First, an insulator surface was subjected to VUV photons (0.5 ev) using apertures of 0.0156 to 0.5 inches in diameter with and without a quartz window. The apertures had no effect in inhibiting a flashover; however, the quartz window prevented the occurrance of insulator flashover. Second the gap closure rate of copper electrodes under the photon fluence of 6 x 10'9 watts per square meter was measured. A gap closure rate of 0.35 cm/microsecond was determined for the copper electrodes.

21306 (ANL/NESC—80R) SOR3; stress analysis of shells of revolution. Fitch, J.R.; Fagan, R.L. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048080.

Maxima of - 30 shells into which the structure is divided 30 input points for the shell 10 points at which detailed stress printout is to be provided for brittle fracture purposes; .

SOR3 is used for the analysis of symmetrically loaded shells of revolution. The program computes stresses, strains, forces and deflections produced by thermal and mechanical loads. Normal and transverse shear stresses and wall thickness changes are taken into account. The program is based on constitutive equations which retain terms through the second order in the ratio of the thickness to the local radii of curvature. These features make the program applicable to shell structures with moderately large thickness to radius ratios.CDC6600; FORTRAN IV; SCOPE 3.0.

21307 (ANL/NESC—251) SAFE-AXISYM; stress analysis of axisymmetric load. Wang, C.L. (Institute of Nuclear Energy Research, Lung-Tan (Taiwan)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048251.

SAFE-AXISYM is a program for the analysis of multi-material axisymmetric composite structures. It is designed for the analysis of heterogeneous structures such as reinforced and prestressed concrete vessels. The structure is assumed to be linearly elastic, and only bodies of revolution subjected to axisymmetric loading can be treated.CDC CYBER73;CDC7600; FORTRAN IV; NOS 1.3 (CDC CYBER73), SCOPE 2.1 (CDC7600); 62,000 (octal) words of memory are required for execution.

21308 (ANL/NESC—252) SAFE-PLANE; plane stress analysis, two-dimensional bodies. Cornell, D.C. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048252.

Multi-material structures with varying rigidities converge very slowly. Not valid for incompressible materials. Maximum number of nodal points = 675. Maximum number of elements = 1350.

SAFE-PLANE is applied to two-dimensional structures of arbitrary geometry under in-plane loads. Either plane stress or plane strain conditions may be imposed. Mechanical and thermal loads are permitted.UNIVAC1108;CDC6600; FORTRAN IV; Approximately 47000 words storage (decimal) plus the operating system (1108). Requirements can be easily reduced by simple adjustment of DIMENSION statements.

21309 (ANL/NESC—253) SAFE-SHELL; stress analysis of thin shells. Cornell, D.C. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048253.

Maxima of - 181 nodal points 180 elements 21 sections 20 nodes per section Capacity can be easily increased at cost of storage requirements .

SAFE-SHELL is used to design and analyze axisymmetric thin-shell structures of arbitrary generatrices under axisymmetric mechanical and/or thermal loading conditions. The intersection of two or more shells can be treated.UNIVAC1108;CDC CYBER73;CDC7600; FORTRAN IV; EXEC8 (UNIVAC1108), NOS 1.3 (CDC CYBER73), SCOPE 2.1 (CDC7600); The UNIVAC1108 version requires 26,000 words of memory and the CDC CYBER73 version requires 76,000 (octal) words of memory for execution.

21310 (ANL/NESC—282R) SEALSHELL2;M0110; shell stress analysis for axisymmetric loading. Friedrich, C.M. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048282.

The SEALSHELL2 program determines stresses, strains, deflections, and reactions in a thick shell of revolution with axisymmetric loading. The loading consists of a temperature distribution, inside and outside pressure distributions, and circumferential forces and moments applied to the middle surface. The shell is linear-elastic with tensile, bending, and shear strains.CDC6600,7600;IBM360; FORTRAN IV; SCOPE 2.0 (CDC6600) and OS/360 (IBM360); 32K memory (CDC6600), 65K (octal) words memory (CDC7600), 185K bytes memory (IBM360).

21311 (ANL/NESC—283R) M0552; dynamic analysis of linear elastic systems. Zanoni, E.A. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048283.

The total number of points used to describe the transient is limited to 2000. An option is provided to enable specification of a general trigonometric series having up to 20 terms, as the transient. The number of modes and mass points that can be considered is limited to 50.

M0552 solves the transient response problem of linear elastic, lumped-mass systems subjected to a unidirectional foundation transient that can be either a velocity or acceleration transient. Normal mode theory is used and the input to the program consists of the mode shapes, frequencies, and foundation transient. Element effects are also evaluated as a function of time. Modal damping coefficients may be specified.CDC6600; FORTRAN IV; SCOPE 2.0; Input tape, output tape, 2 scratch tapes, printer, CDC-280 microfilm plotter.

21312 (ANL/NESC—296) GRDWRK; grid generation for safe programs. Doering, D.A. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048296.

GRDWRK generates as punched output the basic finite element reference grid work for the SAFE codes. This generated grid consists of triangular elements and nodes, uniaxial elements, such as reinforcement bars, tendons, and anchors, and biaxial membranes, such as any thin shell or liner. The punched output serves as direct input data to the SAFE codes.UNIVAC1108; FORTRAN IV; EXEC2, GAX23B through GAX27; 20,100 words plus operating system.

21313 (ANL/NESC—329R) M0457;PIPE; elastic stress of piping system. Friedrich, C.M. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048329.

Maxima of - 100 positions to locate forces and elements 20 force-trails 25 applied loads 50 total loads 20 joint-condition loads 20 sets of material properties 20 sets of stiffness data 99 elastic elements.

PIPE performs an elastic stress analysis of a 3-dimensional piping structure with thermal stresses, redundant loops, and concentrated loads.CDC6600; FORTRAN IV; 100,000 (octal) central memory and 3 tapes (input, output, storage).

21314 (ANL/NESC—332) SAFE-3D; three-dimensional composite structure stress study. Cornell, D.C.; Jadhav, K. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048332.

Maxima of - 5000 nodes 16000 elements The program cannot be applied to incompressible solids and is not recommended for Poisson's ratio in the range of nu between 0.495 and 0.5.

SAFE-3D is a finite-element program for the three-dimensional elastic analysis of heterogeneous composite structures. The program uses the following types of finite elements - (1) tetrahedral elements to represent the continuum, (2) triangular plane stress membrane elements to represent inner liner or outer case, and (3) uniaxial tension-compression elements to represent internal reinforcement. The structure can be of arbitrary geometry and have any distribution of material properties, temperatures, surface loadings, and boundary conditions.UNIVAC1108;IBM360; FORTRAN IV (UNIVAC1108), FORTRAN IV and BAL (IBM360); EXEC2, GAX33A (UNIVAC1108) and OS/360 (IBM360); 52K fast memory storage and 8,000,000 auxiliary storage for the UNIVAC1108.

21315 (ANL/NESC—337R) STEM; matrix generation for a system of beams. Duffy, P.E.; Carlson, F.C. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048337.

The program is limited to a system of 14 beams. The maximum matrix size is 120 by 120. The number of beams plus the number of segments in one case cannot exceed 60.

STEM calculates and punches out partially-coupled mass, stiffness, and internal load function matrices for a structural system of beams having prismatic segments. Shear deformation and rotational inertia are included in the calculations.CDC6600; FORTRAN IV; SCOPE 3.2; Field length of 50,000 octal.

21316 (ANL/NESC—344R) GEM; eigenvalue problem for vibrating systems. Fagan, R.L.; McCalley, R.B. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048344.

Maxima of - 60 degrees of freedom (VEP) 98 commands per case.

GEM is intended primarily to perform vibration studies with the capability of generating input for the VEP (vibration eigenvalue problem) routine and performing additional operations on the output from the SHO (shock) segment. Given a system of masses and springs, the VEP routine computes the natural frequencies of the vibrating system as well as the mode shapes for each frequency. Given the mode shapes, frequencies, and masses of a vibrating system, the SHO routine will compute the deflections and forces at the mass points.CDC6600; FORTRAN IV and ASCENT; SCOPE 2.0.

21317 (ANL/NESC—348R) TOPS; transient thermodynamics of pressurizers. Redfield, J.A. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048348.

Source deck (1703 cards) Sample problem (49 cards) Reference report, WAPD-TM-545.

The TOPS program is a digital simulation of pressurizer dynamics based on a rigorous application of the first law of thermodynamics and phenomological heat and mass transfer laws with empirically determined coefficients. The program is useful in studying the thermodynamic paths of pressurizer transients and is convenient to use as a design tool.CDC6600; FORTRAN IV; SCOPE 2.0; Approximately 100,000 octal locations.

21318 (ANL/NESC—373R) BL47; drafting tool to plot plane structures. Friedrich, C.M.; Cullens, J.J. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048373.

BL47 is a plotting routine designed for plane structures that are to undergo stress analysis. Points and lines are input in various parametric forms, and curved segments are drawn between given points along the given lines. The program may be used as a drafting tool to construct engineering drawings. BL47 uses three points on a straight line segment to obtain dimensions for SEALSHELL2 (NESC Abstract 282) input data.CDC6600; FORTRAN IV; SCOPE; 20,000 words of high-speed memory.

21319 (ANL/NESC—378R) TUBE; u-tube heat exchanger stress analysis. Spivak, A.E.; Lechliter, G.L. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048378.

TUBE solves for the stresses due to pressure and temperature in a U-tube type heat exchanger. Specifically, it handles a configuration consisting of a spherical head, primary transition cylinder, and secondary cylinder. The transition cylinders may be conical and tapered in thickness, but the remaining shells are of uniform thickness. The spherical head and the transition cylinders may be omitted from a problem.CDC6600; FORTRAN IV.

21320 (ANL/NESC—379) SAFE-2D; plane & axisymmetric stress analysis. Cornell, D.C. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048379.

Maxima of - 2 degrees of freedom (radial or horizontal translation and axial or vertical translation) 1200 nodal points 2400 finite elements.

SAFE-2D performs the elastic stress analysis of general axisymmetric, plane, and combined axisymmetric and plane composite structures.UNIVAC1108; FORTRAN IV; EXEC2; SAFE-2D requires 50K, fast memory storage, and 500,000 words of auxiliary storage..

21321 (ANL/NESC—383R) M0266; linear elastic structural dynamics. Wenzel, W.A. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048383.

M0266 is limited to a 50 x 50 mass-flexibility matrix. Other maxima include - 50 masses plus redundants 20 redundants 999 flexible elements 20 effects per element The dynamic analysis is limited to a spectrum-type analysis, which is limited to a one-directional motion of the foundation.

M0266 computes the dynamic shock forces and modal frequencies acting on a lumped mass, linear elastic model of a structure subjected to shock spectrum inputs. The model employed is a collection of lumped masses connected by weightless flexible elements. If the original structure is not statically determinate, redundant forces must be introduced to ensure a primary structure that is.CDC6600; FORTRAN IV; SCOPE 3.1; 105,000 (octal) locations, input tape, output tape, one scratch tape, and printer.

21322 (ANL/NESC—397R) GAPL3; inelastic large deflection stress study. Thurman, A.L. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048397.

The thickness of the plate or shell should fall within the limits of thin shell theory.

GAPL3 determines the inelastic, large-deflection behavior of thin plates or axially symmetric shells with pressure loading and deflection restraints.CDC6600; FORTRAN IV and Assembly language; SCOPE; Minimum core storage of 100,000 (octal) words, a printer, an on-line punch, and a plotter.

21323 (ANL/NESC—402R) SABOR4; discrete-element analysis of thin shells. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy, J.H.; Berg, B.A. (Massachusetts Inst. of Tech., Cambridge (USA). Aeroelastic and Structures Research Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048402.

SABOR4 is a discrete element displacement program for the linear-elastic, static, load-deflection analysis of meridionally-curved, variable-thickness, branched, thin shells of revolution which may be subjected to concentrated or distributed external loading and to isothermal or nonuniform temperature conditions. The program consists of five primary subprograms - HAL4, MELT4, LANCE4, MAINS4, and SUMPLOT4. Three of these (HAL4, MELT4, and LANCE4) process external-mechanical-load or thermal-load data to determine the generalized nodal forces for each discrete element. MAINS4 computes the discrete-element stiffness and mass matrices and forms these matrices for the assembled structure. SUMPLOT4 calculates the other quantities of interest, sums contributions from various loading harmonics, and prepares results for CalComp plotting.IBM360; FORTRAN IV; OS/360.

21324 (ANL/NESC—404R) FINEL; finite-element study in two,-and three-dimensonal structures. Jordan, W.B.; Grieb, L.A. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048404.

FINEL2 maxima - 2000 nodes 1000 elements 4 types of materials 10 different materials of each type 100 groups 500 forces of any one type (x, y, or slant) 500 boundary conditions of any one type FINEL3 maxima - 30 nodes per group if the number of dimensions is 2 20 nodes per group if the number of dimensions is 3 100 groups 1000 elements.

FINEL is a collection of three programs for the calculation of the elastic and plastic behavior of structures. The structures are built up from plates and bars, which can be arranged in either 2-dimensional or 3-dimensional assemblies. The plates can be in plane stress or plane strain. FINEL2 handles 2-D structures only. FINEL3 can handle both 2- and 3-D structures, but is slower.CDC6600; FORTRAN IV; CHIPPEWA.

21325 (ANL/NESC—406) DATATRAN2 RAD1 Geometry Modules; radial geometry modules for two-dimensional imput. Bean, R.H.; Kopp, H.J. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048406.

Curves are limited to straight-line approximations in most modules and to second-order curves in principal modules. The total geometric complexity is not limited.

This series of DATATRAN modules is designed to provide the computerized two-dimensional geometry descriptions required for engineering and nuclear design computations. The modules communicate via DATATRAN N-dot datasets, and the user must link the appropriate modules to perform a specific task. Modules are designed to accept as input data transcribed from engineering drawings, to plot, check, and edit the generated geometric data, and to calculate moments of inertia and area intersections.CDC6600,7600; FORTRAN (90%), COMPASS (5%), DATATRAN2 (5%); DATATRAN2 with SCOPE 3.1, 3.2, 3.3 or SCOPE 3.4 (CDC6600), SCOPE 1.1 (CDC7600).

21326 (ANL/NESC—407) DATATRAN2 Utility Plotting Modules; utility plot modules f(x) & f(x,y). Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Binney, E.J. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048407.

There is a limit of approximately 8,000 points per curve for functions of one variable and 16,000 points for functions of two variables.

This series of DATATRAN modules is designed to provide basic plotting capability in an easy-to-use package. Functions of one or two variables can be accommodated. The modules may be used to plot results of calculations performed by other modules or to display data read from cards or tapes.CDC6600,7600; FORTRAN (80%), COMPASS (15%), DATATRAN2 (5%); SCOPE 3.1, 3.2, 3.3 or SCOPE 3.4 (CDC6600), SCOPE 1.1 (CDC7600).

21327 (ANL/NESC—412R) MANE1; rectangular magnetic network solution. Guerdan, D.A.; Marlowe, O.J. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048412.

The network consists of a number of major rectangles of loops connected to each other in a cyclic fashion.

The MANE1 program finds the magnetic flux in each branch of a magnetic network consisting of a number of branches of iron and air. The problem is one step in the design of slow speed reluctance motors in which the magnetic flux is determined in all component parts for a position of the rotor with respect to the stator.CDC6600; FORTRAN IV; SCOPE 3; For small problems, lr = 18, 35,000 (octal) core locations are required. For large problems, lr = 80, 154,000 (octal) locations are required..

21328 (ANL/NESC—434) HEATMESH; geometrical data heat transfer study. Gabrielson, V.K. (Sandia National Labs., Livermore, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048434.

HEATMESH is used to generate geometrical data required for studies of heat transfer in axisymmetric structures represented as surfaces of revolution. The program consists of two distinct phases. The first subdivides the given parts into a nodal network and evaluates the geometrical properties of the nodes. The second determines adjacent nodes and edits geometrical data for the thermal model.CDC6600; FORTRAN IV; SCOPE.

21329 (ANL/NESC—450) KENO2;KENO4; Monte Carlo multigroup criticality code. Dickinson, D. (Dow Chemical Co., Golden, CO (USA). Rocky Flats Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048450.

KENO4 is flexibly dimensioned so that the allowed size of a problem is limited only by the total data storage available. A method for determining the size of a problem is included in reference 8.

KENO is a multigroup, Monte Carlo criticality code containing a special geometry package which allows easy description of systems composed of cylinders, spheres, and cuboids (rectangular parallelepipeds) arranged in any order with only one restriction. Each geometrical region must be described as completely enclosing all regions interior to it. For systems not describable using this special geometry package, the program can use the generalized geometry package (GEOM) developed for the O5R Monte Carlo code. It allows any system that can be described by a collection of planes and/or quadratic surfaces, arbitrarily oriented and intersecting in arbitrary fashion. Rectangular arrays of fissile units are allowed with or without external reflector regions. Output from KENO consists of keff for the system plus an estimate of its standard deviation and the leakage, absorption, and fissions for each energy group plus the totals for all groups. Flux as a function of energy group and region and fission densities as a function of region are optional output.IBM360;CDC6600; FORTRAN IV and Assembly language (IBM360), FTN FORTRAN with COMPASS subroutine (CDC6600); OS/360 (IBM360) and SCOPE 3.3 (CDC6600); The CDC6600 program requires 64K words of fast core, a disk facility or one or more tape units. The IBM360 version of KENO2 requires approximately 64K words of fast core, a disk facility or one or more tape units. The IBM360 version of KENO4 requires 1 to 6 scratch units besides the standard input/output units and a minimum of about 200K core.

21330 (ANL/NESC—863R) **WHIP1; structural deflection due to blowdown.** Murphy, J.H. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048863.

Maxima of - 200 time-steps 50 input cards 20 alternate force and time pairs Minima of - 14 input cards 2 alternate force and time pairs.

WHIP1 calculates the dynamic behavior of a pipe or membrane under the influences of an externally applied force, taking into account the elastic-plastic properties and the inertia of the member. WHIP1 prints the values of important variables at each time-step and graphs of these variables as output. The program was written to compute pipe deflection, or 'pipe whip' due to rupture and the ensuing blowdown process.CDC6600,7600; FORTRAN IV; SCOPE; 25,000 (octal) words of memory for the CDC6600 or 11,000 (octal) words of memory for the CDC7600.

21331 (BMFT-FB-T—81-107) **Development of cryorefrigerators. Final report, September 1980.** Klein, H.H. (Leybold-Heraeus G.m.b.H. und Co. K.G., Koeln (Germany, F.R.)). Jun 1981. 63p. (In several languages). NTIS, PC A04/MF A01.

Bundesministerium fuer Forschung und Technologie REFS Sponsored by Bundesministerium fuer Forschung und Technologie.

Two types of two-stage Gifford-McMahon- (GM) Refrigerators were developed with different cooling capacities. The GM Refrigerator consists of two components: the coldhead, which produces the cooling capacity, and the compressor unit, which delivers the high pressure helium for the GM-cycle. The design of the coldhead and the compressor unit are described and a short theory of the GM-cycle is presented. Details of the most critical parts such as regenerators, seals at low temperature, dynamic seals, and oil separators are given.

21332 (CONF-810497—3) **Evaluation of the Argonne multi-tube hydride heat exchanger.** Sheft, I., Lamich, G. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 15p. NTIS, PC A02/MF A01. Order Number DE83007773.

From International symposium on metal-hydrogen systems; Miami Beach, FL, USA (13 Apr 1981).

The Argonne multi-tube hydride heat exchanger uses a tubular design hydride bed with the alloys contained in the interstices of open pore aluminum foam for enhanced heat transfer. The alloys, $MmNi_{4\ 15}Fe_{0\ 85}$ (INCO HY-STOR 209) and $LaNi_{4\ 7}Al_{0\ 3}$ (INCO HY-STOR 207) are sealed into aluminum capsules with filters crimped onto the ends. The capsules are contained in the ends of a stainless steel tube and are separated by an empty capsule. H_2 flows in the annular space within the steel tube from one alloy to the other. Ten tubes are combined forming a bundle heat exchanger. Transfer of H_2 from HY-STOR 207 ($LaNi_{4\ 7}Al_{0\ 3}$) at 110C to HY-STOR 209 ($MmNi_{4\ 15}Fe_{0\ 85}$) at 6°C, 10°C or 15°C and then back to HY-STOR 207 at 40°C was determined from thermal effects of H_2 sorption on the alloys. Although the H_2 transferred is greater for greater temperature differences, the measured amount of H_2 transferred is less than expected. This is most likely due to poor heat transfer across the gas space between the aluminum can and the stainless steel tube. As the temperature of the alloy bed equilibrates with the heat transfer fluid, H_2 continues to transfer, but at a rate too slow to have a noticeable effect on the measured heat. With a fluid flow rate of 5 l/min and a temperature resolution of 0.1°C, the limit of observable thermal effect is approximately 0.5 kcal/min, about 0.1 mole H_2/min. For comparison, H_2 the sensible heat transfer is about 2.0 to 2.5 kcal/min for H_2 transfer from HY-STOR 207 to HY-STOR 209 and about 1.0 kcal/min for transfer in the reverse direction. The similarity of the H_2 transfer rates in the two directions in spite of the large pressure ratio difference implies the adequacy of the temperature range used. The relatively rapid measured hydrogen transfer implies that the filters are not plugged and the alloys are not significantly oxidized.

21333 (CONF-821168—1) **Effect of impure refrigerants on evaporative chillers.** Bukacek, R.F.; Tahir, T.B. (Institute of Gas Technology, Chicago, IL (USA)). 1982. 8p. Inst. of Gas Tech., 3424 South State Street, IIT Center, Chicago, IL 60616.

From 4. cryogenics intersociety symposium; Los Angeles, CA, USA (14 Nov 1982).

A simulation of multilevel serial-fed evaporative refrigeration systems was constructed to assess the magnitude of the effects of refrigerant contaminants on evaporator temperatures, cooling performance, condensing pressures and horesepower requirements. The assumptions made for the simulation and the equations developed are discussed. Results are presented for a system loaded with a multicomponent refrigerant containing 2.5% ethane, 95% propane and 2.5% butane. The tabulated results show: the segregation of components that takes place when a multicomponent refrigerant is used in such systems; the composition of the vapor leaving the evaporators and of the vapor to the accumulator; the shift in temperature levels in the evaporators caused by refrigerant impurities; and the consequent changes in evaporator duties. It is concluded that impurities in the refrigerant can limit the maximum system capacity. (LCL)

21334 (CONF-8010206—Vol.1, pp 147-149) **Optimization of the parameters of superconducting dipole winding front parts.** Dojnikov, N.I.; Sychevskij, S.E.; Titov, V.A. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

To provide field homogeneity in the superconducting dipole (SCD) aperture, numerical simulation of spatial fields for SCD with the double-layer saddle-type coil of the shell type is carried out. The problem is reduced to restriction of maximum induction in the end-connector parts of the coil. The method permitting to regard for location and dimensions of the magnetic curcuit and exciting coil is used in calculations. To determine the induction distribution of the magnetostatic field the method of modified scalar potential is used. It is found that the maximum value of induction in end-connector parts of the dipole is on the inner surface of the coil layer. It is shown that the decrease of the maximum of induction in the coil can be obtained by removing the end-connector parts of the coil from the screen or introducing substrates between the loops in the end-connector parts of the lower coil layer.

21335 (DOE/PC/40804—T5) **Measurement of solids motion in gas-fluidized beds. Technical progress report, 1 October 1982-31 December 1982.** Chen, M.M.; Chao, B.T. (Illinois Univ., Urbana (USA). Dept. of Mechanical and Industrial Engineering). 1982. Contract FG22-81PC40804. 28p. NTIS, PC A03/MF A01. Order Number DE83006969.

This technical progress report covers the progress made during the fifth quarter of the project entitled Measurements of Solids Motion in Gas Fluidized Beds under Grant No. DOE-F22-81PC40804 during the period 1 October through 31 December 1982. The research concerns the measurement of solids particle velocity distribution and residence time distribution using the Computer-Aided Particle Tracking Facility (CAPTF) at the University of Illinois at Urbana-Champaign. The experimental equipment and measuring methods used to determine particle size distribution and particle motion and the results obtained are presented.

21336 **(ESA-TT—721) Helium 2 cooling systems with long service live for space use: phase separation hybrid cooling systems.** Klipping, G.; Klipping, I.; Schmidtchen, U. (European Space Agency, 75 - Paris (France)). Mar 1982. 47p. NTIS, PC A03/MF A01.

Transl. into ENGLISH from Helium-II-Kuehlsystem mit langen Srandzeiten fuer Weltraumanwendungen. Phasentrennung, Hybrid-Kuehlsytem , Freie Univ. (Berlin) Sep. 80 REFS.

Phase separation in zero gravity is discussed and the active phase separator for a liquid helium cooled infrared observatory for Spacelab is described. For long-term (more than one year) applications, a hybrid cooling system is required in which refrigerants boiling at higher temperatures are employed. The suitability of hydrogen and neon are investigated as well as that of a secondary solid refrigerant. Analysis indicates that such a hybrid cooling system, using solid neon, can be realized and has substantial advantages compared with a one-stage He2 cooling system.

21337 **(KFK-PDV—199) High-speed flute grinding machine for twist drills and similar fluted tools.** Alber, P.; Schweizer, G.; Guehring, K.; Seit, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Prozesslenkung mit DV-Anlagen). Jan 1981. 207p. (In German). NTIS (US Sales Only), PC A10/MF A01. Order Number DE82902709.

The manufacturing techniques of fluted machining tools currently used are either flute milling or non-cutting processes. The increasing diversity in the range of drilling tools forces the development of a new technology. The design of tools must increase their efficiency, precision and their specific application. When applying the high speed grinding technique with cutting rates of up to 100 m/s peripheral wheel speeds, a technology can be developed which exceeds the machining performance of the so far known milling process by 15 times. The target of the project is to be seen in the development of a grinding machine for flute and body clearance grinding of twist drills and similar fluted tools. With the application of the high speed grinding technique the machining time will be reduced. With the aid of a computer supported tool design, the setting data for the machine will be processed and thus the setting-up times reduced. The objective of the development work has to be seen in the realization of a flute and body clearance grinding machine offering short machning times and flexibility with regard to setting-up.

21338 **(LA—9466-MS-Rev.) Los Alamos National Laboratory Building Cost Index.** Orr, H.D.; Lemon, G.D. (Los Alamos National Lab., NM (USA)). Jan 1983. Contract W-7405-ENG-36. 6p. NTIS, PC A02/MF A01. Order Number DE83007125.

The Los Alamos National Laboratory Building Cost Index indicates that actual escalation since 1970 is near 10% per year. Therefore, the Laboratory will continue using a 10% per year escalation rate for construction estimates through 1985 and a slightly lower rate of 8% per year from 1986 through 1990. The computerized program compares the different elements involved in the cost of a typical construction project, which for our purposes, is a complex of office buildings and experimental laboratores. The input data used in the program consist primarily of labor costs and material and equipment costs. The labor costs are the contractural rates of the crafts workers in the Los Alamos area. For the analysis, 12 field-labor draft categories are used; each is weighted corresponding to the labor craft distribution associated with the typical construction project. The materials costs are current Los Alamos prices. Additional information sources include material and equipment quotes obtained through conversations with vendors and from trade publications. The material and equipment items separate into 17 categories for the analysis and are weighted corresponding to the material and equipment distribution associated with the typical construction project. The building cost index is compared to other national building cost indexes.

21339 **(LBL—14390) Source, origin, and propagation of quenches measured in superconducting dipole magnets.** Caspi, S.; Hassenzahl, W.V. (Lawrence Berkeley Lab., CA (USA)). Nov 1982. Contract AC03-76SF00098. 6p. (CONF-821108—23). NTIS, PC A02/MF A01. Order Number DE83007065.

From Applied superconductivity conference; Knoxville, TN, USA (30 Nov 1982).

Transitions from the superconducting to normal state at 4.4 and 1.8 K in several model accelerator dipoles were recorded by a fast data-acquisition system. The resistive voltage rise in the conductor during the transitions is used to determine accurately the location of the quench source in the magnets and to estimate the axial and turn-to-turn quench velocities. The quench velocity, temperature evolution and energy deposition in the coil were calculated using the program QUENCH, and are in reasonable agreement with the data. In the two dipole magnets studied, the transitions almost always occurred in the regions of highest field. In one coil the high field region is in the straight section because the field in this region is enhanced by iron support rings. In the other magnet the high field region is at the end, in the innermost turn of the first layer. Some quenches were preceded by large voltage spikes that can be ascribed to conductor motion. Other quenches do not appear to be associated with any large energy release. Acoustic emission (AE) was monitored during the tests and AE bursts were observed simultaneous with the initial voltage spike. An increased AE signal continued as the quench progressed.

21340 **(LBL—14445) Ramp rate sensitivities of several superconducting dipole magnets operated in He I and superfluid He II.** Caspi, S.; Gilbert, W.S.; Rechen, J.B. (Lawrence Berkeley Lab., CA (USA)). Nov 1982. Contract AC03-76SF00098. 6p. (CONF-821108—24). NTIS, PC A02/MF A01. Order Number DE83007021.

From Applied superconductivity conference; Knoxville, TN, USA (30 Nov 1982).

The quench current of a superconducting dipole magnet decreases from its slow-ramp value as the current ramp-rate is increased, due to heat buildup in the coil winding. This ramp-rate dependence has been measured for several superconducting dipoles in both normal He I and in superfluid He II. The heat generated by charging fields has been measured for severall magnets in He II, where particularly sensitive and accurate measurements can be made of any heat input to the essentially isothermal helium bath by its temperature rise. Previously measured values of heat transfer are applied to the data from one magnet to explain its observed behavior. The conclusion is drawn that at a given cycle rate, a superfluid He II-cooled superconducting accelerator can operate closer to the short-sample limit of the magnet's superconductor than can a corresponding He I-cooled machine.

21341 **(LBL—15372) Four-layer, two-inch bore, superconducting dipole magnet.** Hassenzahl, W.V.; Peters, C.; Gilbert, W.; Taylor, C.; Meuser, R. (Lawrence Berkeley Lab., CA (USA)). Nov 1982. Contract AC03-76SF00098. 7p. (CONF-821108—21). NTIS, PC A02/MF A01. Order Number DE83006954.

From Applied superconductivity conference; Knoxville, TN, USA (30 Nov 1982).

Superconductors provide the accelerator designer with a unique opportunity to construct machines that can achieve high particle energies and yet have low operating costs. This paper describes the design, fabrication and testing of a 4 layer, 50 mm bore superconducting dipole magnet, D-9A. The magnet reached short sample, 5.8 T at 4.4 K and 8.0 T and 1.8 K, with little training, and exhibited low losses and low ramp rate sensitivity.

21342 **(N—82-24469) Helium 2 cooling systems for long term missions in space: phase separation and hybrid cooling systems.** Klipping, G.; Klipping, I.; Schmidtchen. (Max-Planck-Gesellschaft zur Foerderung der Wissenschaften e.V., Berlin (Germany, F.R.). Fritz-Haber-Institut). Sep 1980. 50p. (In German). NTIS, PC A03/MF A01.

Report will also be announced as translation (ESA-TT-721) REFS.

The suitability of helium 2 (superfluid helium) phase separation and hybrid cooling systems for astronomical and aeronomical observations in space, e.g., infrared radiation, was studied. The different aspects of phase separation under conditions of weightlessness are treated and the active phase separator for a liquid helium cooled infrared observatory for Spacelab, German Infrared Laboratory (GIRL) is described. For long-term (more than one year) applications, a hybrid cooling system is required in which refrigerants boiling at higher temperatures are employed. The suitability of hydrogen and neon were investigated as well as that of a secondary solid refrigerant. Analysis indicates that such a hybrid cooling system, using solid neon, can be realized and has substantial advantages compared with a one-stage He 2 cooling system. (ESA)

21343 (NASA-CP—2122-PT-1) **Cryogenic technology, part 1.** (National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center). Mar 1980. 273p. (L—13547). NTIS, PC A12/MF A01.

Conf. held at Hampton, Va., 27-29 Nov. 1979.

Different engineering problems associated with the design of mechanisms and systems to operate in a cryogenic environment are discussed. The focal point for the entire engineering effort was the design of the National Transonic Facility, which is a closed-circuit cryogenic wind tunnel. The papers covered a variety of mechanical, structural, and systems design subjects including thermal structures insulation systems, noise, seals, and materials.

21344 (NASA-CP—2122-PT-2) **Cryogenic technology, part 2.** (National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center). Mar 1980. 159p. (L—13547). NTIS, PC A08/MF A01.

Conf. held at Hampton, Va., 27-29 Nov. 1979.

Proceedings of a conference on the cryogenic technology developed in support of a transonic wind tunnel are given. Papers address tunnel instrumentation and mode/sting technology.

21345 (NASA-CR—166722) **A preliminary design of the cryogenic system for the Cooled Limb Scanning Interferometer Radiometer (CLIR), phase 3. Final report.** Naes, L.G.; Parmley, R.T.; Nast, T.C. (Lockheed Missiles and Space Co., Palo Alto, CA (USA)). 1981. 82p. NTIS, PC A05/MF A01.

The performance of the cryogenic cooling system for the limb scanning interferometer radiometer (CLIR) instrument which was proposed to be flown on the Atmospheric-Magnetospheric Physics Satellite is discussed. The use of both normal boiling point liquid helium or hydrogen is considered. In determining the performance of the two cooler configurations, a nominal aperture heat of 4.33 watts was used, which is half the value used in previous studies. The reduced aperture heat load reflects that benefits achieved by using an improved baffle configuration. The ground support equipment necessary to support the CLIR cooler in either the liquid helium or solid hydrogen mode was determined. A parts list was generated for both the ground support equipment and the cooler system.

21346 (NASA-CR—168769) **Optically pumped submillimeter-waves and applications. Final report.** Dutta, J.M.; Jones, C.R. (North Carolina Central Univ., Durham (USA)). 1982. 14p. NTIS, PC A02/MF A01.

Rapid development of optically pumped lasers has shown the potential to be used as a source for a high resolution spectrometer. In this connection, a compact, stable FIR laser was designed, fabricated, and assembled, integrating both the pump laser and the FIR cavity in the same mechanical structure for its improved (both thermal and mechanical) stability and mobility. Performance of the mixer structure which was designed and constructed for the evaluation of the Schottky diodes was found to be satisfactory. The feasibility of generating tunable sideband for molecular spectroscopy studies was demonstrated.

21347 (NP—3901016) **Application of the procedure of dynamic relaxation for the calculation of an elastically embedded spherical shell.** Thiede, R. (Hannover Univ. (Germany, F.R.). Inst. fuer Statik). Dec 1980. 58p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE83901016.

In the treatment of elastically embedded shells by finite element methods, a calculation of the rigid body deformations before each iteration essentially improves the convergence of the method. This is also the case when calculating the fictitious densities instead of the real material densities. Some evidence has been obtained for the choice of a damping factor by empirical evaluation of several model calculations.

21348 (PB—82-215450) **A study of design principles for refrigerators for low-power cryoelectronic devices.** Zimmerman, J.E.; Sullivan, D.B. (National Bureau of Standards, Washington, DC (USA). Center for Building Technology). Jan 1982. 116p. (NBS-TN—1049). NTIS, PC A06/MF A01.

This report summarizes a five-year effort at NBS which has been directed toward the development of low-power cryocoolers suited to the support of super-conducting instruments. The report deals with a variety of aspects of construction and operation of refrigerators as well as with a model which allows one to optimize the design for minimum drive power. The publications generated by the program are included as an appendix.

21349 (PB—83-103523) **Signal coupling to thin-film SQUIDS and magnetometry without flux transformers.** Penttinen, A. (Helsinki Univ. of Technology, Espoo (Finland). Dept. of Technical Physics). Dec 1981. 48p. NTIS, PC A03/MF A01.

The efficiencies of several coupling geometries to a thin-film RF-SQUID are analyzed. The schemes of coupling are a single layer solenoid coupling, coupling by a solenoid with a superconducting core, and coupling by a thin-film transformer. Further some light is thrown upon the operation of a SQUID magnetometer, based on shielding currents around a superconducting body. Finally, the inductance formulae for superconducting structures appearing frequently in SQUID devices, are given in the Appendix.

21350 (PNL—4118) **Existing experimental criticality data applicable to nuclear-fuel-transportation systems.** Bierman, S.R. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1983. Contract AC06-76RL01830. 27p. (TTC—0295). NTIS, PC A03/MF A01. Order Number DE83008163.

Analytical techniques are generally relied upon in making criticality evaluations involving nuclear material outside reactors. For these evaluations to be accepted the calculations must be validated by comparison with experimental data for a known set of conditions having physical and neutronic characteristics similar to those conditions being evaluated analytically. The purpose of this report is to identify those existing experimental data that are suitable for use in verifying criticality calculations on nuclear fuel transportation systems. In addition, near term needs for additional data in this area are identified. Of the considerable amount of criticality data currently existing, that are applicable to non-reactor systems, those particularly suitable for use in support of nuclear material transportation systems have been identified and catalogued into the following groups: (1) critical assemblies of fuel rods in water; (2) critical assemblies of fuel rods in water containing soluble neutron absorbers; (3) critical assemblies containing solid neutron absorber; (4) critical assemblies of fuel rods in water with heavy metal reflectors; and (5) critical assemblies of fuel rods in water with irregular features. A listing of the current near term needs for additional data in each of the groups has been developed for future use in planning criticality research in support of nuclear fuel transportation systems. The criticality experiments needed to provide these data are briefly described and identified according to priority and relative cost of performing the experiments.

21351 (SAND—81-2029) **Laboratory technique for simulation of projectile penetration into geological targets.** Setchell, R.E.; Guzman, J.A. (Sandia National Labs., Albuquerque, NM (USA)). Jan 1983. Contract AC04-76DP00789. 22p. NTIS, PC A02/MF A01. Order Number DE83006390.

A new approach to laboratory-scale experiments on high-velocity penetration of projectiles into geological materials is demonstrated. This method utilizes a commercial accelerometer mounted within a small penetrator model that impacts a sample of target material. As in previous laboratory-scale experiments at high velocities, a compressed-gas gun is used in a reverse-ballistics configuration to accelerate a geological sample into an initially stationary penetrator. The present approach provides an acceleration history during the penetration, rather than displacement or velocity data as in these previous studies. Two experiments were conducted at each of two impact velocities using a conical-nosed penetrator and a simulated soft-sandstone target. The recorded accelerometer signals show high-frequency transducer resonances superimposed on the response expected for rigid-body acceleration. Direct numerical techniques are used to extract the rigid-body acceleration history. In addition to demonstrating the effectiveness of this approach, the present results provide useful information on how peak penetrator forces vary with impact velocity during conical-nosed penetration into the simulated sandstone.

21352 **(SAND—82-0053) Thermal analysis of a linear infrared lamp.** Nakos, J.T. (Sandia National Labs., Albuquerque, NM (USA)). Jan 1982. Contract AC04-76DP00789. 94p. NTIS, PC A05. Order Number DE82011679.

A theoretical and experimental analysis of an infrared lamp is presented based on radiant heat transfer theory. The analysis is performed on a specific type of linear lamp which has a coiled tungsten filament surrounded by a fused quartz envelope. The purpose of the study was to model the lamp thermally, not electrically, to arrive at a better understanding of the operation of the lamp.

21353 **(SAND—82-0809) Computing minimum cost fire protection.** Hulme, B.L.; Shiver, A.W.; Slater, P.J. (Sandia National Labs., Albuquerque, NM (USA); Alabama Univ., Huntsville (USA)). Jun 1982. Contract AC04-76DP00789. 51p. NTIS, PC A04/MF A01. Order Number DE83007407.

Presented here is a computational method of protecting a facility from accidental fire. If certain sets of equipment are known to be critical, in the sense that destruction by fire of any of these sets can lead to disastrous consequences, then this method can be used to identify specific areas and barriers for increased fire protection with the result that no single-source fire can spread to and destroy any of the critical sets of equipment. Moreover, these areas and barriers may be chosen so as to minimize the total cost of fire protection. As an alternative, the method can also be used to maximize the probability of fire protection.

21354 **(UCID—19323-82-4) Mechanical engineering research. Quarterly progress report, October-December 1982.** Goldberg, A. (comp.). (Lawrence Livermore National Lab., CA (USA)). 31 Jan 1983. Contract W-7405-ENG-48. 55p. NTIS, PC A04/MF A01. Order Number DE83002795.

The Mechanical Engineering Research (MER) Program is supported by the Nuclear Weapons Program. MER currently is funding eight projects representing four thrust areas. These are: in surface measurements and characterization, an acoustic microscope for surface characterization and automatic spherical surface characterization; in fabrication technology, a diamond turning machine No. 3 and determination of fusion zone energy transport during arc welding; in material characterization and behavior, characterization of martensitic transformations using acoustic emission; temperature and rate effects on elastic-plastic fracture behavior; and in computer-aided engineering; solid geometric modeling and multivariable systems analysis and design. A compilation of the first quarterly FY-83 progress reports for the above projects are presented here. (LCL)

21355 **(UCID—19728) Time-tying of EMP test data.** McGevna, V.G. (Lawrence Livermore National Lab., CA (USA)). 16 Feb 1983. Contract W-7405-ENG-48. 41p. NTIS, PC A03/MF A01. Order Number DE83008311.

An algorithm for automatic time-tying of EMP data sets has been developed. The algorithm reflects the nature of the EMP data as well as the idiosyncracies of the data acquisition system. A number of performance measures which can be generated during time-tying have been identified. These can provide the capability of on-line monitoring of the data acquisition system. Computer monitoring can reduce the need for manual review of data and improve the quality of the data obtained during the course of a test.

21356 **(UCRL—53045) Protecting against failure by brittle fracture in ferritic-steel shipping containers greater than four-in. thick.** Schwartz, M.W. (Lawrence Livermore National Lab., CA (USA)). Dec 1982. Contract W-7405-ENG-48. 48p. NTIS, PC A03/MF A01. Order Number DE83007462.

This report presents methods for protecting against brittle fracture spent-fuel shipping containers made from ferritic-steel forgings greater than four in. thick. Both fracture arrest and fracture initiation criteria were examined as bases for establishing requirements for the design and selection of materials for shipping containers. This report also includes a discussion of the brittle-fracture sensitivity of the containers to various processes used in container fabrication. 19 figures, 3 tables.

21357 **(UCRL—88340) Acceptance testing of two 24" lathes.** Affeldt, D. (Lawrence Livermore National Lab., CA (USA)). 9 Nov 1982. Contract W-7405-ENG-48. 7p. (CONF-8210118—1). NTIS, PC A02/MF A01. Order Number DE83006581.

From Interagency mechanical operations group meeting; Albuquerque, NM, USA (27 Oct 1982).

Tests performed to assure that two 24" lathes with about 60" center distance met specifications for accuracies in straightness, parallelism, positioning and spindle runout are described. (LCL)

21358 **Thermoelectric refrigerator having improved temperature stabilization means.** Falco, C.M. (to Dept. of Energy). US Patent 4,362,023. 7 Dec 1982. Filed date 29 Jul 1981. vp.

PAT-APPL-287965.

A control system for thermoelectric refrigerators is disclosed. The thermoelectric refrigerator includes at least one thermoelectric element that undergoes a first order change at a predetermined critical temperature. The element functions as a thermoelectric refrigerator element above the critical temperature, but discontinuously ceases to function as a thermoelectric refrigerator element below the critical temperature. One example of such an arrangement includes thermoelectric refrigerator elements which are superconductors. The transition temperature of one of the superconductor elements is selected as the temperature control point of the refrigerator. When the refrigerator attempts to cool below the point, the metals become superconductors losing their ability to perform as a thermoelectric refrigerator. An extremely accurate, first-order control is realized.

21359 **Radioactive hot cell access hole decontamination machine.** Simpson, W.E. (to Dept. of Energy). US Patent 4,343,059. 10 Aug 1982. Filed date 6 Apr 1981. vp.

PAT-APPL-251643.

Radioactive hot cell access hole decontamination machine is described. A mobile housing has an opening large enough to encircle the access hole and has a shielding door, with a door opening and closing mechanism, for uncovering and covering the opening. The housing contains a shaft which has an apparatus for rotating the shaft and a device for independently translating the shaft from the housing through the opening and access hole into the hot cell chamber. A properly sized cylindrical pig containing wire brushes and cloth or other disks, with an arrangement for releasably attaching it to the end of the shaft, circumferentially cleans the access hole wall of radioactive contamination and thereafter detaches from the shaft to fall into the hot cell chamber.

21360 **Plans and equipment for criticality measurements on plutonium-uranium nitrate solutions.** Lloyd, R.C.; Clayton, E.D.; Durst, B.M. (Battelle-Pacific Northwest Laboratory, P.O. Box 999, Richland, WA 99352). *Transactions of the American Nuclear Society;* 41: 350-351(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

21367 Aerosol generator for monodisperse Ag- and NaCl-aerosols in the particle size range between 2 nm and 300 nm. Scheibel, H.G.; Porstendoerfer, J.; Becker, K.H.; Hussin, A. pp 319 of Aerosols in science medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

21368 Development of techniques for the preparation of monodisperse solid ferric oxide particles using the May spinning-top aerosol generator. Mitchell, J.P. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

Modifications have been made to the May spinning-top aerosol generator in order to produce satellite free, monodisperse ferric oxide particles in the size range 1 - 10 μm. The problems encountered during the development work are described in detail and the factors which have been found to influence the reliability of this equipment are emphasised.

21369 Commissioning of a commercially available vibrating office aerosol generator. Boyd, J.V. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

Standard monodisperse aerosols are required for the calibration of aerosol particle size analysers. A commercially available vibrating orifice aerosol generator has been commissioned to produce liquid and solid aerosols in the particle size range 2-30 μm. Various problems have been experienced during the operation of this equipment, particularly regarding the reliable generation of solid aerosols. The performance of the generator is reviewed in terms of the liquid feed, the orifice-jet requirements, the solvent evaporation and the solid aerosol drying characteristics.

21370 Real-time aerodynamic particle size analyzer. Agarwal, J.K.; Remiarz, R.J.; Quant, F.R.; Sem, G.J. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

This paper describes a new commercial real-time aerodynamic particle size analyzer. In this instrument, the particles first acquire a velocity which is related to their aerodynamic diameter. The velocity of each particle is then measured by using a laser velocimeter.

21371 (AD-A—115168/7) Energetics and radiative properties of excimer lasers. Final report. Michels, H.H.; Hobbs, R.H. (United Technologies Research Center, East Hartford, CT (USA)). Jan 1981. 172p. (UTRC—924270). NTIS, PC A08/MF A01.

This research program was concerned with a theoretical study of the energetics of the noble gas halides and noble gas dimer and trimer molecular ions. The electronic structure, potential energy curves, and radiative transition probabilities of excimer systems such as ArF and Ar^3F have been examined using quantum mechanical methods. A systematic study of the electronic structure in the noble gas dimer ion sequence, $Ne^2(+)$, $Ar^2(+)$, $Kr^2(+)$ and $Xe^2(+)$, was carried out. This study included detailed calculations of the pertinent potential energy curves and an analysis of the calculated spectroscopic properties of the bound states of these ions. Finally, calculations were carried out on the electronic structure and photoabsorption characteristics of the noble gas trimer ion $Ar^3(+)$. This study included detailed calculations of the potential energy surfaces for $Ar^3(+)$, an analysis of the spectroscopic properties of the ground state of this ion and prediction of the strong absorption bands.

21372 (AD-A—115246/1) Theory of pulse propagation and coherence in free electron lasers. Annual scientific report. Colson, W.B. (California Univ., Santa Barbara (USA). Quantum Inst.). 1982. 10p. NTIS, PC A02/MF A01.

Pulse propagation in several free electron laser designs is examined along with mode instabilities, oscillator evolution, spontaneous emission, transverse wavefront propagation, and Coulomb forces. The designs explored include the simple undulator, the tapered undulator, the optical klystron, and the transverse gradient gain-expansion magnet.

21373 (AD-A—115576/1) Methods for an alternating beam ring laser. Master's thesis. Drake, M.L. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Dec 1981. 75p. NTIS, PC A04/MF A01.

The purpose of this research is to investigate the feasibility of three methods of alternating beams in ring lasers. The first method is the use of a Faraday cell and a half-wave plate inside the laser cavity to rotate the plane of polarization of one of the counter-rotating beams so that lasing in that direction is not supported. The second method, and the one investigated experimentally, is the use of mirrors and a mechanical chopper external to the laser cavity to halt lasing by means of mode competition. The third and final method explored is the replacement of the mechanical chopper with an electro-optical shutter.

21374 (AD-A—115618/1) Electrostatic technology for control of dust and hydrocarbon vapors in high power laser systems. Final report. Hoenig, S.A. (Arizona Univ., Tucson (USA)). Apr 1982. 62p. NTIS, PC A04/MF A01.

The application of electrostatic techniques has been investigated as a repulsion system to keep dust off mirrors that might be used in high-power laser systems. A demonstration unit for a 30 cm mirror was built and shipped to Kirtland Air Force Base as part of the program. Other efforts investigated the development of technology that might be used to keep dust and contaminants off large mirrors in an orbiting space platform. If there is dust deposition it may be practical to clean the reflecting surfaces with a dry wipe-off system without damaging delicate coatings or metal films.

21375 (AD-A—115739/5) Electron drift in a linear magnetic wiggler with an axial guide field. Memorandum report. Pasour, J.A.; Mako, F.; Roberson, C.W. (Naval Research Lab., Washington, DC (USA)). 18 Jun 1982. 24p. NTIS, PC A02/MF A01.

Electron trajectories through a linear magnetic wiggler in an axial guide field are calculated numerically. Off-axis electrons are shown to drift in a direction perpendicular to the wiggler field because of the wiggler gradient. Effects of self fields and initial conditions are analyzed, and the results are compared to those obtained with a helical wiggler. An empirical analytic expression for the linear wiggler drift is presented, and means of stabilizing the drift are discussed.

21376 (AD-A—115936/7) The UCSB free electron laser experimental program. Elias, L.R. (California Univ., Santa Barbara (USA). Quantum Inst.). 28 Oct 1981. 11p. NTIS, PC A02/MF A01.

The University of California at Santa Barbara (UCSB) free electron laser (FEL) program was initiated in January of 1980 at the Quantum Institute to study the operation of electrostatic accelerator free electron lasers. A detailed discussion of the operation of these devices can be found elsewhere in this book under the title 'Electrostatic Accelerator Free Electron Lasers'. The main goal in this paper is threefold: (1) to present a summary of the UCSB experimental FEL program to date, (2) to discuss future FEL device development objectives, and (3) to talk briefly about the future of applied research at UCSB. There is presently in existence a large number of high energy electron accelerator machines that can be readily used as sources of electron beams suitable to demonstrate the basic operation of free electron lasers. This is the case, for example, with the super-conducting electron accelerator at Stanford University where the first operation of the free electron laser was demonstrated in 1975, and where the potential operating characteristics of FEL's such as high power, high efficiency and broadband continuous tunability were clearly delineated. To realize all of the above predicted operating capabilities of free electron lasers it is, however, necessary to develop suitable electron beam sources.

21377 (AD-A—115937/5) Design of the UCSB FEL electron beam system. Elias, L.R.; Ramian, G. (California Univ., Santa Barbara (USA). Quantum Inst.). 28 Oct 1981. 30p. NTIS, PC A03/MF A01.

The UCSB FEL experimental program was initiated January 15, 1980 at the Quantum Institute of the University of California at Santa Barbara. It's principal objective is to demonstrate the operation of electrostatic-accelerator free-electron lasers in (1) the FIR-submillimeter region at high average power and high overall efficiency using a single stage FEL; and (2) the visible-IR region with modest power and modest overall efficiency using a two-stage FEL. An important feature of the UCSB FEL is the recovery of the spent electron beam. Both (1) the average laser power and (2) the overall efficiency of the FEL increase with increased electron beam collection efficiency. Optimum laser performance can be achieved with this device provided only a small fraction of the total electric charge stored in the beam is lost while transporting it through the system. Realization of this low charge loss condition can be achieved only if a very high quality electron beam can be produced and maintained throughout the electron accelerator and transport system.

21378 (AD-A—115938/3) Three dimensional radiation fields in free electron lasers using Lienard-Wiechert fields. Elias, L.R.; Gallardo, J. (California Univ., Santa Barbara (USA). Quantum Inst.). 28 Oct 1981. 24p. NTIS, PC A02/MF A01.

In a free electron laser a relativistic electron beam is bunched under the action of the ponderomotive potential and is forced to radiate in close phase with the input wave. Until recently, most theories of the FEL have dealt solely with electron beams of infinite transverse dimension radiating only one-dimensional E.M. waves (plane waves). Although these theories describe accurately the dynamics of the electrons during the FEL interaction process, neither the three dimensional nature of the radiated fields nor its non-monochromatic features can be properly studied by them. As a result of this, very important practical issues such as the gain per gaussian-spherical optical mode in a free electron laser have not been well addressed, except through a one dimensional field model in which a filling factor describes crudely the coupling of the FEL induced field to the input field.

21379 (AD-A—115942/5) Aspects of high-energy laser theory. Final report. Hillery, M.; Scully, M.O. (New Mexico Univ., Albuquerque (USA)). 31 Oct 1981. 44p. NTIS, PC A03/MF A01.

The research which was conducted under this contract fell mainly into three categories: gain switching, injection locking, and photon statistics. In addition, some work in the foundations of radiative transport theory and spectroscopy was also performed. The use of a metastable state as the upper laser level was shown to offer the possibility of obtaining large inversions and thereby storing large amounts of energy in the lasing medium. The problem associated with this is that the linear gain which one obtains from the transition from this level to the lower laser level is quite small. The possibility of 'dumping' the energy stored in the metastable was investigated.

21380 (AD-A—115944/1) Research on the flow phenomena related to high power laser. Final technical report 1 Nov 78-31 Dec 81. Christiansen, W.H.; Russell, D.A.; Hertzberg, A. (Washington Univ., Seattle (USA)). 31 Mar 1982. 25p. NTIS, PC A02/MF A01.

The fundamental mechanisms of the interaction of electrical discharges of the glow type and the fluid mechanics normally found in electric discharge lasers have been studied in an effort to improve their performance capability. Basic information on these devices was obtained via small-scale experiments at the University of Washington. An alternative method of phase compensation for laser beams using the refractive properties of gas jets was also investigated. The amount of beam degradation produced by turbulent shear layers in the jets was studied also. The experimental investigation of this beam degradation mechanism constitutes much of the effort in the project. Theoretical calculations detailing the effects of mixing of dissimilar gases at low Mach number have been carried out. High-power laser mixing flows have been studied by numerical, analytical, and experimental techniques. The models for wave decay in supersonic cavity flows have been extended, optical sensitivities calculated, and experiments conducted using a laser interferometer. Calculated thermodynamic parameter history through decaying wave systems has been used with simple HF reaction models to study strongly-coupled reaction shocks. A systematic study of the sensitivity of HF laser performance to fluid process assumptions has been carried out, with emphasis on power extraction measurements from a versatile shock/Ludwieg tube laboratory laser.

21381 (AD-A—119907/4) Final report of work in support of the Nrl Fel program. Final report 14 Mar-15 Sep 82. (KM Sciences, Arlington, VA (USA)). 15 Sep 1982. 11p. NTIS, PC A02/MF A01.

The Naval Research Lab. (NRL) Free Electron Laser (FEL) program proposed to use the NRL electron linear accelerator (LINAC) as a source of electrons for its studies. The FEL experiment will place very exacting demands on the parameters of the electron beam from the LINAC. Therefore a careful study of the present operation of the LINAC was necessary in order to determine exactly where and how modifications and improvements could be made to best meet the needs of the FEL program. To do this the system was considered in the following segments: Electron injection electronics, Electron beam injection hardware, Accelerating structure, First 90 degree bend and energy definition, Transport from room 105a to room 103a, Second 90 degree deflection, Beam dump system.

21382 (AD-A—120098/9) Mercury bromide laser discharge life studies. Final report 1 May 81-31 Jan 82. Liu, C.S.; Liberman, I. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Research and Development Center). 3 Aug 1982. 15p. NTIS, PC A02/MF A01.

This report summarizes research work performed at the Westinghouse R/D Center under ONR Contract No. N00014-81-C-0485 for the period between May 1, 1981 and January 31, 1982. The major effort was to perform experimental lifetime studies of the HgBr laser system, and to verify noble metal electrodes for long life operation in HgBr laser discharges. In this report, the results of experimental life tests of gold and platinum electrodes for HgBr lasers are presented. The life expectancy of such electrodes is over 10 to the 8th power shots or 300 hours at 100 pulses per second. The possibility of extending its life to 10 to the 10th power shots is discussed.

21383 (BMFT-FB-T—81-043) Laser tool: pulsed solid state laser for welding and ablation of material. Final report, September 1979. Seiler, P. (Haas (Carl) G.m.b.H. und Co., Schramberg (Germnay, F.R.)). Feb 1981. 20p. (In several languages). NTIS, PC A02/MF A01.

Bundesministerium fuer Forschung und Technologie Sponsored by Bundesministerium fuer Forschung und Technologie.

A system of lasers, focusing and viewing optics, control and power electronics, coolers and mechanical components, was designed. The incorporated Nd-glass pulsed lasers have pulse energies up to 100 Wsec and average output powers up to 100 W. The machines are used in precision and electrical engineering, mainly combined with industrial handling. Being ideally suited for automation, this method has a wide range of application in the field of spot and seam welding of small parts and is widely used to make electric contacts. (ESA)

21384 (BMFT-FB-T—81-095) Optical pumped neodymium miniature laser transmitter. Final report, October 1978. Geckeler, S.; Kruehler, W.; Mahlein, H.F.; Plaettner, R.; Schiffner, G.; Vite, L.; Winzer, G. (Siemens A.G., Muenchen (Germany, F.R.)). Jul 1981. 173p. (In several languages). NTIS, PC A08/MF A01.

Bundesministerium fuer Forschung und Technologie REFS Sponsored by Bundesministerium fuer Forschung und Technologie.

The preparation and the properties of the most important stoichiometric Nd laser materials and miniature lasers made from them are considered as well as calculations for pumping these lasers with LEDs and for coupling them to the modulator. Both optical communication systems and the rival merits of neodym solid-state lasers and semiconductor lasers are considered. The following results are of particular interest: miniature lasers for 1.06 micrometer and in some cases for 1.32 micrometer fabricated from NdP^5O^{14}, $NdAl^3(BO^3)^4$ and $LiNd(PO^3)^4$ with mirrors directly applied to their endfaces allowing CW operation at room temperature. The LNP laser with 1 mW threshold, 6% differential efficiency and a threshold pump power density of 4 kW/cu cm offers the best performance. The electrooptical coefficient expected for $NdAl^3(BO^3)^4$ on the basis of lattice symmetry was found to be 0.6 x 10 to the -12 power m/V. The Nd laser transmitter can be expected to cost considerably more than the future INGAP semiconductor laser transmitter.

21385 (BMFT-FB-T—81-151) Laser diode. Final report, May 1980. Mettler, K.; Zschauer, K.H.; Wolf, H.D.; Endler, W. (Siemens A.G., Muenchen (Germany, F.R.)). Sep 1981. 78p. (In several languages). NTIS, PC A05/MF A01.

Stable, profitable, narrow proton and oxide stripe lasers were fabricated from multiple layers of (Ga,Al)As by the dimensioning of the structure based on a two dimensional mathematical model. They operated satisfactorily in the experimental system at data rates of 560 Mbit/s. Accelerated degradation tests gave extrapolated life times for room temperature operation in excess of 100,000 hours. Furthermore, three index guided laser structures (BH, CSP and RIG) were tested (In,Ga)(As,P)/InP multilayers were fabricated and tested by using broad mesa lasers.

21386 (CONF-820336—9) Generation of narrow-band tunable radiation in the 1200-A spectral region. Tomkins, F.S.; Mahon, R. (Argonne National Lab., IL (USA); Maryland Univ., College Park (USA)). 1982. Contract W-31-109-ENG-38. 6p. NTIS, PC A02/MF A01. Order Number DE83007621.

From Optical Society of America topical meeting on laser techniques for extreme ultraviolet spectroscopy; Boulder, CO, USA (8 Mar 1982).

Investigation of frequency up-conversion in Hg vapor has been extended further into the vuv, producing continuously tunable narrow-bandwidth radiation from 1220 A to 1174 A.

21387 (DOE/ER/10979—2) Nonlinear optics with broadband lasers. Progress report, July 15, 1982-July 14, 1983. Raymer, M.G. (Rochester Univ., NY (USA). Inst. of Optics). Mar 1983. Contract AC02-81ER10979. 42p. NTIS, PC A03/MF A01. Order Number DE83008369.

Experiments directed at understanding the fundamental nature of broad-band laser radiation and the consequences of using such radiation in non-linear optics are reported. Unexpected, exciting results were found in our measurements of intensity fluctuations in a broad-band cw dye laser, in which a new type of laser instability was observed. Its properties led us to tentatively identify the instability as a phase transition in a nonlinear system, a topic of great current interest in statistical mechanics and physics in general. Improvements have been made in our methods for making intensity autocorrelation measurements of pulsed dye lasers, and interesting properties of such lasers have been discovered. A system based on a high resolution detector array has been designed and constructed for the purpose of making single-shot measurements of pulsed laser spectra and of field cross-correlations in Raman scattering. The single-shot laser spectra are being observed with a novel Fizeau interferometer which we designed and constructed. The justification of our design for the proposed field cross-correlator has been further strengthened by a detailed theoretical analysis of this new measurement technique. Also, progress has been made on the theory of stimulated Raman scattering of broad-band, chaotic laser radiation.

21388 (LA-UR—83-330) High-efficiency free-electron laser results. Boyer, K.; Brau, C.A.; Newnam, B.E.; Stein, W.E.; Warren, R.W.; Winston, J.G.; Young, L.M. (Los Alamos National Lab., NM (USA)). 1982. Contract W-7405-ENG-36. 10p. (CONF-820988—7). NTIS, PC A02/MF A01. Order Number DE83007545.

From Free electron laser conference; Bendor, France (26 Sep 1982).

Results obtained with a tapered-wiggler free-electron laser show deceleration of electrons by as much as 7%, and extraction of more than 3% of the total electron-beam energy as laser energy.

21389 (N—82-14389) KrF laser pumping by electron beam discharge. Bonnet, J.; Fournier, G.; Pigache, D. (Office National d'Etudes et de Recherches Aerospatiales (ONERA), 75 - Paris (France)). Sep 1981. 5p. NTIS, PC A05/MF A01.

In its La Rech. Aerospatiale, Bi-monthly Bull. No. 1981-2, Mar. - Apr. 1981 (ESA-TT-713) p 3-7 (SEE N82-14388 05-31) Transl. into ENGLISH from La Rech. Aerospatiale, Bull. Bimensuel (Paris) No. 1981-2, Mar. - Apr. 1981 REFS.

The pumping of excimer lasers used in nuclear fusion and isotope separation is considered. Homogeneous ionization with an electron beam permitted discharge pumping of a KrF laser with a discharge-energy/beam-energy ratio 5. This high value is obtained to the detriment of an energy density and an efficiency which are about half the best values obtained under other conditions. This result does not modify a recent conclusion indicating that an electron beam controlled discharge has no significant advantage over a pure electron beam as regards pumping high energy KrF lasers at high repetition rate. (ESA)

21390 **(N—82-25097) Electronic beam steering of semiconductor injection lasers.** Katz, J. (Jet Propulsion Lab., Pasadena, CA (USA)). Apr 1982. 17p. NTIS, PC A09/MF A01.

In its The Telecommun. and Data Acquisition Rept. p 25-41 (SEE N82-25092 15-99) REFS.

A theoretical analysis of the problem of beam steering is presented. The required modifications of the dielectric constant profile of the laser structure were derived. A practical method for implementing the needed modifications is outlined.

21391 **(N—82-25098) Phase control and beam steering of semiconductor laser arrays.** Katz, J. (Jet Propulsion Lab., Pasadena, CA (USA)). Apr 1982. 8p. NTIS, PC A09/MF A01.

In its Telecommun. and Data Acquisition Rept. p 42-49 (SEE N82-25092 15-99) REFS.

The operational principles and a possible device configuration of one dimensional monolithically integrated semiconductor laser arrays are described. The output beam of the array can be electronically steered. Devices of the type can find applications in optical communication systems where the power levels needed are above the capability of a single laser device.

21392 **(N—8228617) A survey of some recent developments in laser Raman spectroscopy.** Jenden, C.M. (Materials Quality Assurance Directorate, London (England)). Oct 1981. 22p. Materials Quality Assurance Directorate, London, England.

Computer controlled Raman spectrometers, resonance Raman spectroscopy (RRS), time resolved Raman spectroscopy (TRS), the laser Raman microprobe (LRM) and coherent Raman spectroscopy (CRS) are discussed. The RRS works well with aqueous or solid substances, giving simple spectra with good resolution and detection. Fluorescence problems limit its usefulness. While TRS reduces fluorescent background scattering, and can give quantitative results from Raman spectra, it is complicated and expensive. The LRM maps each species in a heterogeneous sample, with molecular analysis of the whole sample area. Spectra can be observed in real time. Low laser power increases operating lifetime. Advantages of CRS include high conversion efficiency short spectral acquisition time and collimated output. It is not useful for media with large losses, e.g., opaque materials. Sensitivity is limited and spectra are disturbed by neighboring resonances.

21393 **(NASA-CASE-GSC—12565-1) Laser resonator.** Harper, L.W. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center; International Laser Systems, Inc., Orlando, FL (USA)). Jun 1981. 18p. NTIS, PC A02/MF A01.

Sponsored by NASA.

An optical resonator cavity configuration uses a unitary mirror with an oppositely directed convex reflective surface and a concave reflective surface disposed into one fold which concertedly reverses both ends of a beam propagating from a laser rod disposed between two total internal reflection prisms. The prisms are rigidly positioned with perpendicularly crossed virtual rooflines by a compact optical bed. The rooflines of the internal reflection prisms are arranged perpendicularly to the axis of the laser beam and to the optical axis of the optical resonator components. NASA

21394 **(NASA-Case-LAR—12870-1) A solar pumped laser.** Lee, J.H. (Vanderbilt Univ.); Hohl, F. (National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center). Dec 1981. 16p. NTIS, PC A02/MF A01.

A solar pumped laser in which the lasant is a gas is described. The gas will photodissociate and lase when subjected to sunrays. Sunrays are collected and directed onto the gas lasant to cause it to lase.

21395 **(NASA-CR—3520) Studies of single-mode injection lasers and of quaternary materials. Volume 1: Single-mode constricted double-heterojunction AlGaAs diode lasers. Final report, 4 Feb. 1980 - 15 May 1981.** Botez, D. (RCA Labs., Princeton, NJ (USA)). Apr 1982. 70p. NTIS, PC A04/MF A01.

Constricted double-heterojunction (CDH) lasers are presented as the class of single-mode nonplanar-substrate devices for which the lasing cavity is on the least resistive electrical path between the contact and the substrate. Various types of CDH structures are considered under three general topics: liquid-phase epitaxy over channeled substrates, lateral mode control, and current control in nonplanar-substrate devices. Ridge-guide CDH lasers have positive-index lateral-mode confinement and provide: single-mode CW operation to 7 mW/facet at room temperature and to 3 mW/facet at 150 C light-current characteristics with second-harmonic distortion as low as -57 dB below the fundamental level threshold-current temperature coefficients, as high as 375 C (pulsed) and 310 C (CW) constant external differential quantum efficiency to 100 C and lasing operation to 170 C CW and 280 C pulsed. Semileakyguide CDH lasers have an asymmetric leaky cavity for lateral-mode confinement and provide single-mode operation to 15 to 20 mW/facet CW and to 50 mW/facet at 50% duty cycle. Modulation characteristics and preliminary reliability data are discussed.

21396 **(NASA-CR—3521) Studies of single-mode injection lasers and of quaternary materials. Volume 2: Measurement of electro-optic effects in InGaAsP junction waveguides. Final report, 4 Feb. 1980 - 15 May 1981.** Hammer, J.M. (RCA Labs., Princeton, NJ (USA)). Apr 1982. 30p. NTIS, PC A03/MF A01.

Both the linear electro-optic (Pockel's) effect and electroabsorption (Franz-Keldysh effect) in waveguiding junctions of InGaAsP were measured. The electro-optic coefficient is found to be 0.1-0.14x10 to the -12 power m/V at lambda 1.54 - 1.65 micrometers. Possibly this is the first reported measurement of the electro-optic coefficient for InGaAsP. The value found for the electroabsorption is on the order of 7x10 to the -4 power cm to the -1 power/(V/cm) or approximately 100 cm/1 for fields of 200,000 V/cm at lambda 1.3 micrometers. All measurements were made on a quaternary film with a bandgap wavelength of 1.23 micrometers. Because of the rapid commercial introduction of quaternary lasers, LEDs, and detectors to take advantage of large optical fiber bandwidths and low losses in the 1.2- to 1.7- micrometer region, these measurements are significant in providing some of the basic physical constants needed to design modulators and switches capable of operating at microwave frequencies in this wavelength region.

21397 **(NASA-CR—165520) Free electron lasers for transmission of energy in space. final report.** Segall, S.B.; Hiddleston, H.R.; Catella, G.C. (KMS Fusion, Inc., Ann Arbor, MI (USA)). Oct 1981. 40p. NTIS, PC A03/MF A01.

A one-dimensional resonant-particle model of a free electron laser (FEL) is used to calculate laser gain and conversion efficiency of electron energy to photon energy. The optical beam profile for a resonant optical cavity is included in the model as an axial variation of laser intensity. The electron beam profile is matched to the optical beam profile and modeled as an axial variation of current density. Effective energy spread due to beam emittance is included. Accelerators appropriate for a space-based FEL oscillator are reviewed. Constraints on the concentric optical resonator and on systems required for space operation are described. An example is given of a space-based FEL that would produce 1.7 MW of average output power at 0.5 micrometer wavelength with over 50% conversion efficiency of electrical energy to laser energy. It would utilize a 10 m-long amplifier centered in a 200 m-long optical cavity. A 3-amp, 65 meV electrostatic accelerator would provide the electron beam and recover the beam after it passes through the amplifier. Three to five shuttle flights would be needed to place the laser in orbit.

21398 **(NASA-TM—83857) On the theory of gamma ray amplification through stimulated annihilation radiation (grasar).** Ramaty, R.; McKinley, J.M. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Nov 1981. 36p. NTIS, PC A03/MF A01.

The theory of photon emission, absorption, and scattering in a relativistic plasma of positrons, electrons, and photon was studied. Expressions for the emissivities and absorption coefficients of pair annihilation, pair production, and Compton scattering are given and evaluated numerically. The conditions for negative absorption were investigated. In a system of photons and e(+) - e(-) pairs, an emission line at at approximately 0.43 MeV can be produced by grasar action provided that the pair chemical potential exceeds approximately 1 MeV. At a temperature of approximately 10 to the 9th power. This requires a pair density approximately 10 to the 30th power cm to the (-3) power a value much larger than the thermodynamic equilbrium pair density at this temperature. This emission line could account without a gravitational redshift for the observed lines at this energy from gamma ray bursts.

21399 **(NP—3900905) Detailed numerical code to analyze pumping linear cavities for solid-state lasers.** Roccella, M.; Tranquilli, A. (Comitato Nazionale per l'Energia Nucleare, Frascati (Italy). Lab. Nazionali di Frascati). Jan 1982. 15p. NTIS (US Sales Only), PC A02/MF A01.

A numerical code has been developed which allows the treatment of very complicated illumination geometry of the pumping cavity of solid-state lasers by means of linear flash lamps using Monte Carlo simulation. A compromise has been reached between the request of stochastic independence of the events and the need to keep calculation times reasonably low, by using a ray-tracing procedure based on graph technique. In this way, certain specific effects, such as refraction caused by cooling fluids and the scattering due to the finishing (polished or ground) of the surface, can be analyzed in greater detail than has previously been possible. Some examples are given in the text.

21400 **(NPL-MOM—54) Frequency dependence of a 633-nm He-Ne laser stabilized bby $^{127}I_2$, upon iodine pressure, modulation amplitude, and wall temperature.** Rowley, W.R.C. (National Physical Lab., Teddington (UK)). Sep 1981. 17p. NTIS, PC A02/MF A01.

The beat frequency of the frequency shifts of a 633 nm He-Ne laser (S) stabilized by intracavity saturated absorption to hyperfine components e and f of Iodine was measured. The reference laser (M) had an unheated iodine cell and an 18 C cold finger temperature. Half the observations were of S locked to iodine peak 2, M locked to f, and the rest with components interchanged. Linear frequency to pressure and frequency to modulation relations result, with the coefficients and extrapolated intercepts at zero pressure being dependent on the wall temperature. These relations are expressed in an empirical formula that enables the frequency correction to be calculated within + or - 5% for any deviation from standard operating parameters. (ESA)

21401 **(NPL-MOM—58) Development of optically pumped molecular dimer lasers at NPL.** Barwood, G.P. (National Physical Lab., Teddington (UK)). Jan 1982. 20p. NTIS, PC A02/MF A01.

Continuous wave laser oscillation was demonstrated in iodine by pumping with a krypton ion laser at 521 nm and 531 nm. Simultaneous oscillation on up to 16 lines in the range 540 nm to 650 nm was observed and over 50 lines were measured and identified. The threshold pump power is 80 mW at 531 nm. A sodium dimer laser was investigated and 27 laser lines were obtained in the range 520 nm to 560 nm by pumping with the blue lines of an argon ion laser. Up to 5 mW output power can be obtained with only 80 mW of single frequency pump power at 472.7 nm. (ESA)

21402 **(UCRL—88657) Line-coincidence schemes for producing laser action at soft-x-ray wavelengths.** Chapline, G.F. (Lawrence Livermore National Lab., CA (USA)). 12 Jan 1983. Contract W-7405-ENG-48. 14p. (CONF-830127—1). NTIS, PC A02/MF A01. Order Number DE83007352.

From Winter colloquium on quantum electronics; Snowbird, UT, USA (12 Jan 1983).

Line-coincidence schemes for producing laser action in the wavelength regime 100-30A are reviewed. Schemes involving pumping of 2→4 transitions in neon-like ions are singled out as particularly attractive.

21403 **Programmable multifunction laser.** Wayne, R.J.; Henschke, R.W.; Mongeon, R.J. US Patent Application 6-403,458. 30 Jul 1982. 16p.

This multi-format modulated laser may be programmed to produce a variety of output waveforms by applying a different one of a plurality of modulating waveforms thereto. The outputs can includes continuous waves, both modulated and unmodulated, Q-switched pulses, cavity dumped pulses, shaped pulses and mode locked pulses. The laser is provided with an intracavity electro-optic modulator and may comprise two coupled cavities with a gain cell in one cavity and the modulator in the other cavity.

21404 **Modulated infrared laser with two coupled cavities.** Wayne, R.J.; Laughman, L.M.; Mongeon, R.J.; Chenausky, P.P. US Patent Application 6-403,439. 30 Jul 1982. 15p.

The intracavity modulated laser includes a main cavity and an adjacent coupled cavity with a gain cell in the main cavity and an electro-optic modulator in the coupled cavity, the cavities being coupled in such a way that the energy level in the coupled cavity during laser operation is much lower than that in the main cavity, and whereby the modulator can selectively affect the polarization of energy in accordance with a voltage applied there-to to selectively couple energy out of both cavities in a desired manner.

21405 **(AD-A—111944) Laser journal (selected articles).** Translated from *Laser J. (China);* 8: No. 1, 5-9, 10-13, 18-20, 47-48(Feb 1982). vp. (FTD-ID(RS)T—1390-81). .

A collection of articles on laser application and technology is presented. The following topics are discussed: effects of thermal deformation in mirrors on resonator parameters, folded resonator for high power lasers, copper vapor laser, experiments and research of electron beam control XeCl quasimolecule laser.

21406 **Power shifts of a 633-nm $^{127}I_2$ stabilized He-Ne laser, for various mirror curvatures.** Rowley, W.R.C. Teddington, England; National Physical Lab. (1981). 20p. .

Beat frequency measurements were made by comparison with a reference laser, of the frequency shifts at different output powers of a 633 nm He-Ne laser stabilized by intracavity saturated absorption to hyperfine components e and f of iodine 127. Results show that at normal output powers the stabilized frequency and the power shift coefficients depend on the curvatures of the cavity mirrors. At low powers the coefficients are larger than at normal powers, but the absolute laser frequency is less sensitive to the mirror curvatures. Results indicate that certain combinations of mirror curvatures make the stabilized frequency insensitive to output power. (ESA)

4204 Heat Transfer And Fluid Flow

REFER ALSO TO CITATION(S) 19636, 19867, 20070, 20265, 20324, 20349, 20351, 20553, 20680, 20713, 21332, 21333, 21335, 21352, 21653

21407 **(ANL/NESC—198) HEATING2; transient steady-state heat transfer.** Belt, B.D. (Southern Services, Inc., Atlanta, GA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048198.

Maxima of - 750 nodes 100 material regions 40 materials.

HEATING2 is a generalized heat transfer code capable of solving transient and steady-state coordinate systems. The simplified input makes it a very useful code for those problems having geometrical configurations which can be described by parallel and perpendicular lines or planes, or concentric circles. These figures can be broken up into a maximum of 100 one-material regions with position and time-dependent volumetric heat generation rates. Up to 40 materials with constant properties can be described, and the initial temperatures of these regions are position-dependent. The boundaries of these regions can be contact, insulated, time-dependent temperature controlled, or forced convection with a time-dependent sink temperature. Also a radiation boundary with a time-dependent sink temperature is included.IBM370,3033; FORTRAN IV; OS/370; 255K bytes memory and temporary use of a direct access device (unit 7) are required for execution. 300K bytes of memory were needed for FORTRAN IV H-Extended compilation.

21408 **(ANL/NESC—286R) HOT2; two-dimensional transient heat conduction program.** Peterson, W.D. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048286.

Contact resistances are not included in the program computations, but must be approximated by use of thin regions of a low-conductivity material. Heat generation rates, boundary film coefficients, and boundary sink temperatures are assumed to be known. The program is intended to handle up to 99 regions, 5000 mesh points, 250 mesh points in each coordinate direction.

HOT2 is a digital computer program to solve two-dimensional plane and axially symmetric steady-state and transient heat conduction problems with diagonal boundaries and interfaces. Mesh spacing (at most 5000 points) is completely variable. As many as 99 regions are permitted in order to describe spatial variations in material properties, heat generation rates, and boundary conditions. The heat generation rate and boundary conditions may vary with time.CDC6600; FORTRAN IV; SCOPE 2.0; 64K memory, card reader, printer, and punch, one system disk and 4 non-system disks, each on its own channel.

21409 **(ANL/NESC—382R) RAPP; high-velocity flow study of steam-water mixtures.** Sorenson, C.W. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048382.

Maxima of - 6 flow areas for computing pressure distribution with known flow 2000 pressure increments.

RAPP computes the relationship among mass flow, pressure, and piping resistance (k-factor) for high velocity flow of a two-phase mixture of steam and water. The source fluid may be subcooled or saturated water, saturated steam, or a mixture of steam and water. The downstream pressure must be below the saturation pressure of the source fluid. Specific applications include pressurizer surge line pressure drop and pressure distribution downstream of a relief valve.CDC6600; FORTRAN IV; SCOPE; 45K to compile and execute.

21410 **(ANL/NESC—408) TAC2D; steady-state and transient temperature calculations.** Petersen, J.F.; Clark, S.S. [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048408.

(a) The grid line system must be orthogonal in the rectangular, cylindrical, or circular coordinate system.

TAC2D is designed to treat transient, two-dimensional heat transfer problems. Steady-state problems are treated by considering the problem to be a transient, starting with an assumed temperature distribution and running until equilibrium conditions are established. Geometrically, rectangular (x,y), cylindrical (r,z), or circular (r,theta) coordinates may be used.UNIVAC1108;IBM360,370,303x; FORTRAN V (UNIVAC1108), FORTRAN IV (IBM360); EXEC2 (UNIVAC1108), OS/360 (IBM360); 65K words are required on the UNIVAC1108 and 380K bytes on the IBM360. In addition to input/output, a maximum of four and a minimum of no tapes are required depending upon the code options being used..

21411 **(ANL/NESC—414) TAC3D; transient three-dimensional heat transfer program.** Petersen, J.F. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048414.

(a) The grid plane system must be orthogonal in the rectangular or cylindrical coordiante system.

TAC3D is designed to treat transient, three-dimensional heat transfer problems. Steady-state problems are treated by considering the problem to be a transient, starting with an assumed temperature distribution and running until equilibrium conditions are established. Geometrically, the problem may be defined by either rectangular (x,y,z) or cylindrical (r,z,theta) coordinates.UNIVAC1108; FORTRAN V; EXEC2; 65K memory. A maximum of four and a minimum of no tapes are required, depending upon the code options being used..

21412 **(ANL/NESC—435) BURST1; hydrodynamic analysis during blowdown.** Jayne, G.A.; Hanson, G.H. (Idaho Nuclear Corp., Idaho Falls (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048435.

Maxima of - 50 total cylinders and adapters 2000 space-steps in the whole system 5000 time-steps Only subcooled, frictionless, adiabatic cases can be considered.

BURST1 provides for the study of pressurized liquid in a cylindrical system immediately after a rupture occurs at one or both ends of the system. Pressure, mass velocity, and enthalpy are calculated at equally-spaced mesh points along the length of the system. This is a one-dimensional representation, assuming uniform conditions throughout any given cross-sectional area. Forces on designated sections of the system can also be computed, with provision for directional changes.IBM360/75; FORTRAN IV; OS/360; 32K memory.

21413 **(ANL/NESC—440) DYNAM; dynamic analysis boiling flow steam.** Schlueter, G. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048440.

Maxima of - 30 intervals used to describe the power distribution in the nonboiling and boiling regions 29 boiling nodes 7 intervals and corresponding friction multipliers read in per case 14 exit qualities read in per case 40 superheat nodes 10 coefficients read in for the phi2 vs, x-polynomial fit 48 frequencies at which open-loop frequency response is desired 48 frequencies at which signal output is desired.

DYNAM performs a dynamic analysis of once-through boiling flow oscillations with steam superheat. The model describing the superheat regime (single-phase, variable density fluid) for subcritical pressure operation is also applicable to the study of once-through operation using supercritical pressure water.UNIVAC1108; FORTRAN; EXEC2.

21414 **(ANL/NESC—517) HEATING5;HEATING3; 1,2, or 3-dimensional heat conduction program.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Siman-Tov, I.I. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048517.

HEATING5 is designed to solve steady-state and/or transient heat conduction problems in one-, two-, or three-dimensional Cartesian or cylindrical coordinates or one-dimensional spherical coordinates. The thermal conductivity, density, and specific heat may be both spatially and temperature-dependent. The thermal conductivity can be anisotropic. Materials may undergo a change of phase. Heat generation rates may be dependent on time, temperature, and position, and boundary temperatures can be time-dependent.and/or temperature-dependent. The mesh spacing can be variable along each axis. HEATPLOT is a temperature distribution plotting program which may be used with a plotting data set produced by HEATING5 to plot temperature contours (isotherms), temperature-time profiles, and temperature-distance profiles from a temperature distribution or from temperature changes relative to an initial temperature distribution. REGPLOT is a pre-processor graphics program which generates maps of the regions with labels for the materials, the heat generation function numbers, the initial condition function numbers, and the boundary condition function numbers specified by the input data to permit the user to visually check the HEATING5 input data. HEATING3 is designed to solve steady-state and/or transient heat conduction problems in one-, two-, or three-dimensional cartesian or cylindrical coordinates. Thermal conductivity, density, and specific heat may be dependent on temperature. Heat generation rates may be dependent on position and time, and the boundary temperatures may be time-dependent.

21415 (ANL/NESC—858) APACHE; two-dimensional chemically reactive fluid flow code. Ramshaw, J.D.; Dukowicz, J.K. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048858.

The fluid is assumed to be an ideal-gas mixture with temperature-independent specific heats. Chemical reactions are assumed to be elementary. Current dimensioning in the program allows only one rotational and vibration level of the lasing species to be considered and a maxima of - 1 chemical reaction 10 chemical species 32 cells in the horizontal direction 22 cells in the vertical direction These restrictions may be increased by increasing the values of the appropriate parameter variables and the corresponding DIMENSION statements.

APACHE is a time-marching finite-difference code developed to solve the equations of transient viscous multicomponent chemically reactive fluid dynamics in two space dimensions. A steady-state solution is obtained as the asymptotic limit of a transient calculation.CDC7600; FORTRAN IV; SCOPE; APACHE requires 33,000 (octal) words of small core memory and 56,000 (octal) words of large core memory.

21416 (ANL/NESC—859) SOLA-LOOP; two-phase flow network analysis. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Torrey, M.D. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048859.

Conservation of momentum is not required by the finite difference approximations used for the momentum equation. Current dimensioning in the SOLA-LOOP program allows maxima of - 10 components 8 segments per component 200 junctions 6 time levels, pressure groups, and vapor production rates per cell 5 boundary data sets These restrictions may be adjusted by changing the values of the variables NP, NS, NJ, NK, and NM, respectively, and all appropriate DIMENSION statements.

SOLA-LOOP is designed for the solution of transient two-phase flow in networks composed of one-dimensional components. The fluid dynamics is described by a nonequilibrium, drift-flux formulation of the fluid conservation laws. Although developed for nuclear reactor safety analysis, SOLA-LOOP may be used as the basis for other types of special-purpose network codes. The program can accommodate almost any set of constitutive relations, property tables, or other special features required for different applications.CDC7600,6600; FORTRAN IV; SCOPE; 34,000 (octal) words of memory are needed to execute the program.

21417 (ANL/NESC—865) PELE-IC; fluid-structure interaction analysis. McMaster, W.H.; Gong, E.Y. (Lawrence Livermore National Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048865.

PELE-IC is a two-dimensional semi-implicit Eulerian hydrodynamics program for the solution of incompressible flow coupled to flexible structures. The code was developed to calculate fluid-structure interactions and bubble dynamics of a pressure-suppression system following a loss-of-coolant accident (LOCA). The fluid, structure, and coupling algorithms have been verified by calculation of benchmark problems and air and steam blowdown experiments. The code is written for both plane and cylindrical coordinates. The coupling algorithm is general enough to handle a wide variety of structural shapes. The concepts of void fractions and interface orientation are used to track the movement of free surfaces, allowing great versatility in following fluid-gas interfaces both for bubble definition and water surface motion without the use of marker particles.CDC7600; FORTRAN IV; SCOPE 2.1, LTSS; 123,000 (octal) words of SCM and 272,000 (octal) words of LCM are used.

21418 (ANL/NESC—900) SALE2D; general transient fluid flow algorithm. Amsden, A.A.; Hirt, C.W. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048900.

Source decks (FORTRAN 2427 cards, UPDATE 2025 cards) Sample problem (43 cards) Reference report, LA-8095.

SALE2D calculates two-dimensional fluid flows at all speeds, from the incompressible limit to highly supersonic. An implicit treatment of the pressure calculation similar to that in the Implicit Continuous-fluid Eulerian (ICE) technique provides this flow speed flexibility. In addition, the computing mesh may move with the fluid in a typical Lagrangian fashion, be held fixed in an Eulerian manner, or move in some arbitrarily specified way to provide a continuous rezoning capability. This latitude results from use of an Arbitrary Lagrangian-Eulerian (ALE) treatment of the mesh. The partial differential equations solved are the Navier-Stokes equations and the mass and internal energy equations. The fluid pressure is determined from an equation of state and supplemented with an artificial viscous pressure for the computation of shock waves. The computing mesh consists of a two-dimensional network of quadrilateral cells for either cylindrical or Cartesian coordinates, and a variety of user-selectable boundary conditions are provided in the program.CDC7600,CYBER175; FORTRAN IV; SCOPE 2.1, LTSS, NOS 1.3; 165,000 (octal) words of memory are required for the report version, which allows up to 800 mesh points. The memory requirement will increase if more mesh points are used.

21419 (ANL/NESC—934R) NASA; MHD-modified chemical equilibrium code. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy, J.H.; Doss, E.D. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048934.

Maxima of - 250 species 5 elements per species In the computation of the electrical properties of the plasma, only the following species are considered: hydroxyl, cesium, argon, carbon monoxide, carbon dioxide, nitrogen, oxygen, water, nitric acid, potassium hydroxide, sulfur dioxide, potassium, and electrons.

NASA is a substantially modified release of the NASA-Lewis computer program for chemical equilibrium compositions. The modifications were designed to extend the program to perform combustor analysis for MHD systems studies. NASA calculates the thermodynamic and electrical properties of a chemically reactive gas mixture. The rocket, detonation, and constant volume equilibrium options of the parent code have been deleted. The new features added include: a) a routine for computing the electrical properties of the equilibrium mixture, b) shorthand input data option for treating standard hydrocarbon fuels, c) a facility for incorporating heat losses in the NASA HP mode computations, and d) a printed summary of equilibrium thermodynamic properties.IBM370,303x; FORTRAN (42%) and PL/I (58%); OS/MVT; 300K bytes of memory are generally sufficient to execute the NASA program.

21420 (ANL/NESC—948) SOLA-VOF; transient fluid flow free boundaries. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Hotchkiss, R.S. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048948.

The setting of array dimensions is controlled through PARAMETER statements.

SOLA-VOF is a program for the solution of two-dimensional transient fluid flow with free boundaries, based on the concept of a fractional volume of fluid (VOF). Its basic mode of operation is for single fluid calculations having multiple free surfaces. However, SOLA-VOF can also be used for calculations involving two fluids separated by a sharp interface. In either case, the fluids may be treated as incompressible or as having limited compressibility. Surface tension forces with wall adhesion are permitted in both cases. Internal obstacles may be defined by blocking out any desired combination of cells in the mesh, which is composed of rectangular cells of variable size.CDC7600,CYBER175; FORTRAN FTN5 compiler; SCOPE (CDC7600), NOS (CDC CYBER175); 72,000 (octal) words of memory.

21421 (CONF-820614—6) Two-fluid model and importance of the interfacial area in two-phase flow analysis. Ishii, M.; Mishima, K.; Kataoka, I.; Kocamustafaogullari, G. (Argonne National Lab., IL (USA); Wisconsin Univ., Milwaukee (USA)). 1982. Contract W-31-109-ENG-38. 9p. NTIS, PC A02/MF A01. Order Number DE83007615.

From 9. US national congress of applied mechanics; Ithace, NY, USA (21 Jun 1982).

The interfacial transfer terms are the weakest link in a two-fluid model formulation because of considerable difficulties in terms of experimentation as well as modeling. However, these terms are of supreme importance for a two-fluid model in determining phase interactions between liquid and vapor. In view of these, the interfacial transfer terms have been studied in detail and new constitutive relations have been developed. The interfacial terms are proportional to the interfacial area and driving force, therefore these two effects are modeled separately. 7 figures, 30 references.

21422 (DOE/METC—82-51, pp 109-111) PETC advanced research and technology development - surface gasification - high pressure fluidization cold model research. Strakey, J.P. (Pittsburgh Energy Tech. Center, PA). Sep 1982. NTIS, PC A10/MF A01.

From 2. annual advanced gasification projects contractors' meeting; Morgantown, WV, USA (22 Jun 1982).

The objective of this project is to develop a data base for the effect of pressure on fluidization parameters such as: minimum fluidization velocity, complete fluidization velocity, minimum bubbling velocity, bubble size, bubble velocity, jet penetration distance, distributor design effects, etc. Work to develop a data base for the effect of pressure on fluidization parameters is essential for the design and scale-up of gasifiers, such as the Westinghouse gasifier. Availability of such data in the literature is severely limited. The almost unique nature (it is one of only two such units known to exist in the United States) of this unit accentuates its value as a tool for developing a high pressure fluidization data base. Preliminary results are: minimum fluidization velocity decreases slightly with an increase in pressure; complete fluidization velocity decreases dramatically with an increase in pressure and seems to approach a minimum value at a pressure that may depend somewhat on particle size distribution; minimum bubbling velocity increases significantly with an increase in pressure and seems to approach a maximum value at a pressure that may depend somewhat on particle size distribution; bed height normally increases with increased superficial gas velocity. At high pressures a characteristic phenomenon is displayed. A point is reached in which the bed height actually decreases for a time with increased superficial velocity; the bed height then again begins to increase with increasing superficial velocity. Also completed were a series of photographic tests using an 8-inch two-dimensional plexiglas model. The purpose of these tests was to compile a visual library of information concerning bubbling beds.

21423 (LA-UR—83-519) Finite-element approach to analyzing coupled thermal-hydraulic problems. Bennett, J.G.; Girrens, S.P.; Cort, G.E.; Graham, A.L.; Johnson, N.L. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 12p. (CONF-830320—1). NTIS, PC A02/MF A01. Order Number DE83007565.

From 3. international conference on numerical methods in thermal problems; Seattle, WA, USA (1 Mar 1982).

The finite-element method is used to study thermal-hydraulic systems to determine the pressures and temperatures necessary to obtain an engineering description of a convecting fluid. The fluid-motion formulation utilizes nonlinear flow-resistance coefficients based on experimentally determined relationships associating the hydraulic gradient and velocity field for steady flows. The code developed may also be used in a noncoupled mode to perform either transient thermal analysis or steady laminar fluid flow. Problems analyzed demonstrating code applicability to engineering problems include target design in a proton accelerator, nonlinear free-surface porous flow, multi-layered convecting flow patterns observed in solar-pond simulation experiments, and convective flow/structural interaction in reactor-safety studies.

21424 (N—82-20004) Some aspects of two-phase flow, heat transfer and dynamic instabilities in medium and high pressure steam generators. Unal, H.C. (Technische Hogeschool Delft (Netherlands)). Mar 1981. 249p. NTIS, PC A11/MF A01.

Experimental data for void fraction, incipient point of boiling, initial point of net vapor generation, bubble dynamics, dryout, two-phase flow pressure drop and density-wave oscillations were obtained in long, sodium heated steam generator tubes of different geometries for a wide range of operating conditions and at medium and high pressures. These data and data from literature taken in sodium and electrically heated steam generator tubes were correlated. Aspects of two-phase flow, heat transfer and density-wave oscillations in these steam generators disclosed include the distribution factor in small- and medium-size diameter steam generator tubes, the characteristic of the transitions at the incipient point of boiling and initial point of net vapor generation, bubble growth during subcooled nucleate flow boiling, the importance of the equivalent length for dryout in non-uniformly heated steam generator tubes and the mechanisms of density-wave oscillations in once-through steam generator tubes.

21425 (NP—3900025) Evaluation of transient heat transfer in parallel tube bundles by the Monte-Carlo-Method. Dobbernack, R. (Technische Univ. Braunschweig (Germany, F.R.). Fakultaet fuer Maschinenbau und Elektrotechnik). 14 Dec 1979. 120p. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number DE83900025.

Thesis.

The aim of the present paper is to describe by means of a physical/mathametical model the transient heat transfer by radiation in parallel tube bundles as a function of geometrical variations, material properties, and mathematical interrelationships of radiation. The study is based on a three-dimensional approach in order to be able to describe with the results obtained the influences on the heat transfer in steam generator tube bundles as well as the conditions in burnable configurations. In the first part of the paper the absorption numbers are determined by means of a FORTAN IV computer code. The results are discussed as a function of the parameters chosen. In the second part of the paper the transient cooling-down behavior of tube bundles is investigated, thermal radiation and free convection between the tubes and heat conduction in the tube wall being taken into account. For this purpose another code was written the results of which describe the time-dependent temperatures of all segments, arbitrary tube geometries for the bundle being prescribed.

21426 (NP—3901009) Investigations of an airlift reactor with external circulation with respect to its application as a bioreactor. Weiland, P. (Dortmund Univ. (Germany, F.R.). Abt. Chemietechnik). 15 Dec 1978. 174p. (In German). NTIS (US Sales Only), PC A08/MF A01. Order Number DE83901009.

Thesis.

In the present paper the fluid dynamics as well as the mixing and mass transfer behavior of an airlift reactor with external circulation were investigated and compared with the behavior of bubble columns. In view of the application as a bioreactor the studies were made with material systems of different ionic strength, surface tension and viscosity. All of the experiments were made of a pipe loop with a gas-loaded liquid level of 8.51 m. The reactor diameter of the gas-loaded up-flow region of the airlift reactor could be varied towards the behavior of a discontinuous bubble column by means of throttling the circulating fluid flow. Direct comparison of both operating modes thus became possible. The results of measurement showed that the airlift reactor with external circulation is an appropriate gas injecting equipment for performing biological reactions. The relatively high gas loads required for sufficient oxygen supply and the special flow characteristics of the reactor leading to reduced formation of gas bubbles make this type of reactor appear especially suited for large construction heights. Reactors of the design investigated here were used already in a number of cases in pilot plants for production of proteins from single-celled organisms.

21427 **(SAND—79-1623(Rev.)) MARIAH - a finite-element computer program for incompressible porous-flow problems: user's manual.** Gartling, D.K.; Hickox, C.E. (Sandia National Labs., Albuquerque, NM (USA)). Jan 1983. Contract AC04-76DP00789. 104p. NTIS, PC A06/MF A01. Order Number DE83006847.

MARIAH is a finite-element computer program designed for the solution of two-dimensional, incompressible flows in a porous media, including the effects of heat transfer. The program capabilities and complete user instructions are presented. Several example problems are described in detail to demonstrate the use of the program. The theoretical background for MARIAH is documented in the Sandia National Laboratories Report, SAND79-1622

21428 **Forced-convective post-CHF heat transfer and quenching.** Nelson, R.A. (Associate Mem. ASME, EG & G Idaho, Inc., Idaho Falls, Idaho 83415). *Journal of Heat Transfer;* **104**: No. 1, 48-54(Feb 1982). Contract AC07-76ID01570.

Mechanisms in the postcritical heat flux region that provide understanding and qualitative prediction capability for several current force-convective heat-transfer problems are discussed. In the area of nuclear reactor safety, the mechanisms are important in the prediction of fuel rod cooldown and quenches for the reflood phase, blowdown phase, and possibly some operational transients with dryout. Results using the mechanisms to investigate forced-convective quenching are presented. Data reduction of quenching experiments is discussed, and the way in which the quenching transient may affect the results of different types of quenching experiments is investigated. This investigation provides an explanation of how minimum wall superheats greater than the homogeneous nucleation temperature result, as well as how these may be either hydrodynamically or thermodynamically controlled.

21429 **High Rayleigh number laminar convection in low aspect ratio enclosures with adiabatic horizontal walls and differentially heated vertical walls.** Tichy, J.; Gadgil, A. (Assistant Professor, Department of Mechanical Engineering, Rensselaer Polytechnic Institute, Troy, New York 12181, Mem. ASME). *Journal of Heat Transfer;* **104**: No. 1, 103-172(Feb 1982). Contract W-7405-ENG-48.

Laminar flow in shallow horizontal cavities (aspect ratio $a<<1$) at high Rayleigh numbers ($>10^6$) is investigated using an approximate analysis based on first principles, and also with numerical solutions to the full equations. A Prandtl number of approximately one is assumed. It is found that the flow regime at such high values of Ra is characterized by boundary layers lining both vertical as well as horizontal walls of the enclosure, and is qualitatively different from the flow regimes at lower Rayleigh numbers. The internal region of the core (near to the horizontal centerline) exhibits linear velocity and temperature profiles. Typical isotherms and streamlines characteristic of this flow regime are presented, based on the numerical solutions. The velocity and temperature profiles predicted from the approximate analysis are found to compare well with those obtained from the numerically obtained solutions. The Nusselt numbers predicted from the analysis are also in good agreement with the numerical solutions, and with the limited experimental data in the literature. The various physical processes in this type of flow are discussed based on the findings of the analytical and numerical studies.

21430 **(CAPE—2677) Practical heat conduction for everyday problems (CE3142) (Engineering Materials).** (Lawrence Livermore National Lab., CA (USA)). [nd]. Contract W-7405-ENG-48. TIC. Order Number DE83006217.

Methods that allow one to simply assess heat conduction problem areas that occur during design reviews or everyday work are presented. Emphasis is on quick answer techniques. Complex solution methods will not be covered in great detail. This is a 6 lecture course: (1) energy balance, lumped system, heat equation, response time estimate; (2) electrical circuit analogy for heat conduction, how to determine whether your problem is 1 or 2 dimensional heat conduction, problems with heat conduction, problems with heat generation, contact resistance; (3) lumped mass, distributed mass-1D wall, how to determine if a problem is lumped or distributed, significance of time estimate formulations; (4) how to use chart solutions; (5) what to use and when to use it; and (6) mathematical analysis.

4205 Materials Testing

21431 **(GEPP-TIS—699) Interfacing a torsion pendulum with a microcomputer.** Bush, J.A.; Newby, J.W. (General Electric Co., St. Petersburg, FL (USA). Neutron Devices Dept.). 24 Feb 1983. Contract AC04-76DP00656. 15p. NTIS, PC A02/MF A01. Order Number DE83004032.

Shear modulus testing is performed on the torsion pendulum at the General Electric Neutron Devices Department (GEND) as a means of gauging the state of cure for a polymer system. However, collection and reduction of the data to obtain the elastic modulus necessitated extensive operator involved measurements and calculations, which were subject to errors. To improve the reliability of the test, an analog-to-digital interface was designed and built to connect the torsion pendulum with a minicomputer. After the necessary programming was prepared, the system was tested and found to be an improvement over the old procedure in both quality and time of operation. An analysis of the data indicated that the computer generated modulus data were equivalent to the hand method data, but potential operator errors in frequency measurements and calculations were eliminated. The interfacing of the pendulum with the computer resulted in an overall time savings of 52 percent.

21432 **(INIS-mf—7211) Contribution to the determination of J-integral and crack opening displacement as material characteristics and their application in safety-assessments of pressure vessels.** Mildner, H. (Technische Univ., Vienna (Austria)). May 1981. 111p. (In German). NTIS (US Sales Only), PC A06/MF A01/ Also available by loan from the TU Vienna, Austria Sign. 156.350 II/Diss.. Order Number DE83780156.

Thesis (Dr. techn.).

For fracture mechanics assessment of the safety of metal structures some material characteristics are necessary, which should be independent of the dimensions of the tested specimens. For the required minimum dimensions of the specimens some conditions are known, which, however, are inexact or contradictory, especially in the case of elastic-plastic materials behaviour. In this work the influence of specimen dimensions on elastic-plastic fracture mechanics values is investigated for structural steel in three states of heat treatment (normalized, quenched and tempered, coarse grain annealed). Standard specimens with greatly differing dimensions are tested according to J-integral- and COD-standards and are evaluated with regard to fracture initiation. Conditions for specimen dimension for structural steel are derived from the test results, depending on micro-structure and test temperature. If these conditions are not satisfied, the material characteristics measured in the upper shelf region are somewhat too low. Testing at different temperatures shows here, that there is a contrary influence on the material characteristics by specimen size and test temperature. The comparison of J-integral- and COD-test results shows that both methods produce practically equal fracture toughness values and that there is plane strain condition in the specimens at fracture initiation. From plates of the above-mentioned quenched and tempered steel several pressure vessels were welded. Artificial flaws were put into them and they were subjected to burst tests. The burst behaviour of the pressure vessels can be assessed with elastic-plastic material characteristics and fracture mechanics calculations. (author).

21433 **Reliability of systems of dependent components.** George, L.L.; Wells, J.E. (Lawrence Livermore Natl Lab, CA). *Transactions of the Annual Technical Conference, American Society for Quality Control;* 154-160(May 1981).

A method is developed to compute the reliability of a multiple component system. This method computes system reliability accurately because the program represents dependent component failures. Component failure occurs if the random stress applied to the component exceeds its random strength. System failure occurs if any cut set of components fails. The method also determines which components or parameters have the largest effect on system failure probability.

Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048537.

1 to 6 degrees of freedom in the base motion 1 to 30 rows and columns in the flexibility matrix 0 to 3 types of damping.

FUGIT1 performs a transient step analysis of an elastic structure mounted on a rigid base which has a given shock history of motion. The structure may have nonlinear constraints and damping.CDC6600; FORTRAN IV; SCOPE; Input tape, output tape, 150,000 (octal) central memory, plot routines.

21438 (ANL/NESC—539) STRAP; static & dynamic structural analysis. Dearien, J.A.; Uldrich, E.D. (EG and G Idaho, Inc., Idaho Falls (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048539.

STRAP-S maxima - 250 degrees of freedom 100 members STRAP-D maxima - 100 degrees of freedom 80 time-steps in the forcing function input.

The code STRAP (STructural Analysis Package) was developed to analyze the response of structural systems to static and dynamic loading conditions. STRAP-S solves for the displacements and member forces of structural systems under static loads and temperature gradients. STRAP-D will solve numerically a given structural dynamics problem.IBM360; FORTRAN IV; OS/360; 300K bytes of memory for each program plus 5 to 7 direct access storage devices besides standard I/O for STRAP-D.

21439 (LA—9624-M) EVENT user's manual: a computer code for analyzing explosion-induced gas-dynamic transients in flow networks. Tang, P.K.; Andrae, R.W.; Bolstad, J.W.; Gregory, W.S. (Los Alamos National Lab., NM (USA)). Jan 1983. Contract W-7405-ENG-36. 88p. NTIS, PC A05/MF A01. Order Number DE83007150.

This report contains supporting information for the computer code EVENT, which can predict explosion-induced gas-dynamic transients in flow networks. The code is capable of analyzing transients in any arbitrarily designated interconnections in a network of building rooms and ventilation systems. The EVENT code is designed to provide improved methods of safety analysis for the nuclear, chemical, and mining industries. A lumped-parameter formulation is used. This version of the EVENT code is particularly suitable for calculating the detailed effects of explosions in the far field using a parametric representation of the explosive event. The input for the code and a sample problem that illustrates the code's capabilities are provided.

21440 (NP—2902736) Control and dispersion of hazardous gas clouds with water sprays. van Doorn, M. (Technische Hogeschool Delft (Netherlands). Afdeling Technische Natuurkunde). Sep 1981. 171p. NTIS (US Sales Only), PC A08. Order Number DE82902736.

This thesis considers water sprays as a means of reducing the hazards arising from escaped gas clouds. In view of the resistance to mass transfer dispersion of a cloud is generally more promising than physical or chemical ab/adsorption. The main objective of the dispersing action is rapidly to mix the gas with a large amount of air, in order to diminish the chance of calamity. The spray curtain is considered as an air pump and the important parameters for this aspect of performance have been studied.

21441 (DOE/ER/10459—38) Studies of sub-micron devices with emphasis on MOS systems. Progress report, July 1, 1982-June 30, 1983. O'Connell, R.F. (Louisiana State Univ., Baton Rouge (USA). Dept. of Physics and Astronomy). 1983. Contract AS05-79ER10459. 12p. NTIS, PC A02/MF A01. Order Number DE83007336.

This progress report is primarily concerned with a program of analysis of the so-called two dimensional electron gas which occurs on semiconductor surfaces in MOS systems and on the free surface of liquid helium. (GHT)

21442 (DOE/SF/00515—T3) Chopper control board check out: summary of chopper operation. PEP storage ring magnets and power supply system. Fuller, R.W. (Stanford Linear Accelerator Center, CA (USA)). 1 Apr 1982. Contract AC03-76SF00515. 10p. NTIS, PC A02/MF A01. Order Number DE82014963.

The chopper can be simplified by comparing its main SCR (or SCR's) to a switch being easily turned on with the main firing pulse (pulses) from the controller board. The commutator SCR is also a switch which turns on a ringing circuit that can shut off the main SCR and reset itself when given about 80 micro seconds to complete its cycle. Therefore, by operating the main SCR's for a longer or shorter time into a magnet and repeating this cycle many times a second so that the magnet smoothes out the variations in current, a regulated current can be maintained in the magnet. If the commutator firing pulse is delayed further in time the current in the magnet will increase. If the main pulse is followed shortly by the commutator pulse, current in the magnet will decrease. The increments of increase or decrease are very small due to the shortness of the cycle compared to the time constant of the magnet. The purpose of the pulse controller is then to deliver a main pulse trian and a commutator pulse train properly spaced for regulation in the 400A chopper. For the 1400 A chopper the main pulses must also be alternated between two SCR's so they can share the load current. The controller also establishes limits for the pulses to allow safe operation for the magnet and the chopper. The minimum pulse length to the magnet is 20% of the period at 2000 hertz. The maximum pulse length is 95% of the period at 2000 hertz. Some of the choppers run at 360 hertz, for this lower frequency the minimum pulse length is 1.8% of the period (the same number of micro-seconds), and the maximum length is 99% of the period. Note that the lower frequency gives a wider range at a sacrifice of frequency response.

21443 (GEPP-TIS—667a) Field shaping to improve vacuum-diode voltage holdoff. Furno, E.J.; Shafer, R.E. (General Electric Co., St. Petersburg, FL (USA). Neutron Devices Dept.). 15 Feb 1983. Contract AC04-76DP00656. 19p. NTIS, PC A02/MF A01. Order Number DE83008123.

In our work we need a small vacuum diode which will reliably hold off a pulse voltage in excess of 150 kV. These diodes typically have an interelectrode spacing of 6 to 10 mm with a glass insulator length 3 to 4 times the interelectrode spacing. We found that the overall holdoff voltage for a diode with a fixed insulator and interelectrode gap length was strongly affected by the position of the interelectrode gap. Experiments were made with two sizes of diodes, varying the location of the interelectrode space from the negative end to the positive end. The large diode high voltage holdoff ranged from 240 kV with the interelectrode space at the negative end to 180 kV with the interelectrode space in the middle of the insulator. The smaller diode high voltage holdoff ranged from a high of 200 kV with the interelectrode space at the negative end to 130 kV with the interlectrode space at the positive end. The minimum at the middle was not as pronounced in this diode. Since most of the high voltage breakdowns were across the glass insulator, electron avalanching was suspected. Computer generated field plots confirmed this possibility. With the interelectrode space at the negative end, the field lines direct any field emission electrons from the triple junction or the edge of the negative electrode away from the glass. All other configurations direct the electrons toward the glass. Thus shaping the field so that any field emission electrons are directed away from the insulator improves the high voltage holdoff by minimizing the probability of an avalanche type surface breakdown.

21444 (LA-UR—83-407) Ka-band microwave generation using the Smith-Purcell effect. Ekdahl, C.A.; Davis, H.A. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 8p. (CONF-830314—4). NTIS, PC A02/MF A01. Order Number DE83007556.

From 2. national conference on high power microwave technology; Adelphi, MD, USA (1 Mar 1983).

The CERETRON microwave generator concept relies on the conversion of intense relativistic electron beam (REB) energy into highpower microwave emission through the Smith-Purcell effect. We report initial results from experiments with the production of Ka-band Smith-Purcell radiation generated by a 50-kA, 2.8-MeV beam propagated through a cylindrical transmission grating with lambda$_0$ = 1 cm. These experiments were performed without a quasi-optical resonator, and the output was limited by breakdown of the grating and by limited access through the 90-kG magnet coil. Nevertheless, the measured power output from these initial experiments was about 7 kW in the Ka band.

21445 (UCRL—50025-82-2) Electronics Engineering Department quarterly report No. 2, 1982. (Lawrence Livermore National Lab., CA (USA)). Oct 1982. Contract W-7405-ENG-48. 27p. NTIS, PC A03/MF A01. Order Number DE83007213.

The work of the Electronics Engineering Department at LLNL includes applied research, technology base development and programmatic application of methods in signal processing, image processing, and control systems. This progress report focuses on: computers and software for applications of an training programs related to signal processing; the development of a facility for the interactive processing of images; and the design, analysis and LLNL applications of control systems. (LCL)

21446 High-sensitivity resistivity technique for studies of defect behavior. Tzanetakis, P.; Birnbaum, H.K. (University of Illinois, Materials Research Laboratory and Department of Metallurgy and Mining Engineering, Urbana, Illinois 61801). *Review of Scientific Instruments;* **54**: No. 3, 366-368(Mar 1983).

An experimental method for measurement of the contribution to the electrical resistivity due to solutes or defects is described. This technique, which is based on an ac Kelvin Double Bridge may be used at elevated temperatures and does not require the use of liquid helium. The resistivity caused by solutes or defects, rho/sub x/s, can be determined at temperatures near 300 K with an accuracy of better than Δrho/sub x/s/rho/sub x/sroughly-equal10^{-3}; with the major source of error being the accuracy to which the material resistivity is known. Relative changes in the solute (defect) resistivity can be measured with a precision of 5 x 10^{-10} Ω cm. A specimen design and mounting procedure, which takes advantage of the high bridge sensitivity, is described.

21447 (SAND—83-6000) Bonding wire for semiconductor-element use. Kaisha, T.K.K.K. (Sandia National Labs., Albuquerque, NM (USA)). Jan 1983. Contract AC04-76DP00789. Translation of Patent Application No. 1980-73622. 7p. NTIS, PC A02/MF A01. Order Number DE83007239.

This invention relates to a bonding wire used to make electrical connection between a chip electrode and the external lead of a semiconductor element. The patent specifies the use of palladium wire with purity greater than 99.97% or better by weight ratio. (LCL)

21448 Fast transient digitizer. Villa, F. (to Dept. of Energy). US Patent 4,364,029. 14 Dec 1982. Filed date 8 Jul 1981. vp.

PAT-APPL-281453.

Method and apparatus for sequentially scanning a plurality of target elements with an electron scanning beam modulated in accordance with variations in a high-frequency analog signal to provide discrete analog signal samples representative of successive portions of the analog signal; coupling the discrete analog signal samples from each of the target elements to a different one of a plurality of high speed storage devices; converting the discrete analog signal samples to equivalent digital signals; and storing the digital signals in a digital memory unit for subsequent measurement or display.

21449 Impedance measurement method for double-gap klystron cavity. Zhao, Y.X. (Stanford Linear Accelerator Center, CA). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Electron Devices;* **ED-29**: No. 2, 316-320(Feb 1982). Contract AC03-76SF00515.

A new method has been developed for measuring the impedance of a two-gap cavity used in high-power klystrons. The principle is based on network analysis. The cavity under test is considered as a microwave network. The two gaps of the cavity and its output terminal are referred to as three ports. An impedance matrix can then be used to characterize this system, and the six independent impedance parameters can be found by measuring the input impedance seen from the output waveguide when the gaps are in different conditions; viz., either open, shorted, or perturbed. The gap impedance then can be deduced therefrom. It is shown that there are three impedances for a double-gap cavity instead of one for a single-gap cavity. Another problem dealt with here is how to evaluate the capacitance introduced by the perturbation. A few typical experimental results are presented.

21450 (ORNL/MIT—347) **Assessment of parameters in the simulation of an ANFLOW municipal-wastewater-treatment pilot plant.** Hata, W.Y.; Leis, J.R. (Oak Ridge National Lab., TN (USA)). Feb 1983. Contract W-7405-ENG-26. 88p. NTIS, PC A05/MF A01. Order Number DE83007178.

An assessment of the parameters used in a computer program which dynamically models an anaerobic upflow (ANFLOW) bioreactor was performed. The problem was scrutinized for the proper interprethation of cited literature references, suitable documentation, applicability of assumptions, and agreement with pilot-plant data. Single-variable sensitivity analyses indicated tat increased bacterial loading can increase the removal of organic materials and that changes in decay rate constants greatly affect the operational stability of the bioreactor. These findings imply that a clearer understanding of the kinetics is essential for the program to quantitatively predict reactor performance. Correlation of tracer residence-time-distribution data by the Box optimization technique indicated that the reactor was best characterized as a series of three unequal-volume CSTRs with volume ratios of 1:3:6.

REFER ALSO TO CITATION(S) 19593, 19626, 19631, 19641, 19645, 19684, 19784, 19956, 20242, 20245, 20246, 20258, 20264, 20276, 20867, 20900, 20939

21451 (DOE/MC/14129—1392) **Fluidised-bed combustion. Burning coal-water mixtures in a pressurised fluidised bed: some initial results.** (National Coal Board, Leatherhead (UK). Coal Utilization Research Lab.). Feb 1983. Contract AC21-80MC14129. 51p. NTIS, PC A04/MF A01. Order Number DE83007921.

The feeding of coal-water mixtures (CWMs) into a pressurised fluidised-bed combustor (PFBC) could considerably simplify the more usual method of pneumatically-feeding dried coal from lock hoppers. The UK National Coal Board has developed a flow sheeting computer package ARACHNE, and it has been used to evaluate the effect of additional moisture on cycle efficiency and plant output. The evaluation showed that operation with a CWM containing 30% water would lower the cycle efficiency by only 0.8 percentage point and have little effect on the overall plant output. An experimental program is being undertaken at CURL, to assess the performance (e.g., combustion efficiency, sulphur retention) when burning CWMs. Some initial tests are described. Operation using CWMs with solids contents of 65, 70 and 75% was extremely steady with excellent control of bed temperature. Combustion efficiency was greater than 99% at 1560°F bed temperature and about 98% at 1380°F bed temperature, which equals efficiencies obtained when burning normal crushed coal at comparable conditions in this combustor. Sulphur retention performance was somewhat better than has been obtained with a normal (high sulphur) crushed coal in this combustor with the same sorbent. NO/sub x/ emissions varied between 0.25 and 0.47 lb/10^6 Btu, depending on excess air - similar to values obtained on other rigs with normal crushed coal. Results from the limited tests carried out so far are extremely promising. Further tests are planned. (LCL)

21452 (NASA-CASE-GSC—12354-1) **Inorganic spark chamber frame and method of making the same.** Heslin, T.M. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Apr 1982. 9p. Avail: US Patent and Trademark Office.

Filed 7 Mar. 1980 Supersedes N80-20565 (18 - 11, p 1420).

A spark chamber frame, manufactured using only inorganic materials is described. The spark chamber frame includes a plurality of beams formed from inorganic material, such as ceramic or glass, and are connected together at ends with inorganic bonding material having substantially the same thermal expansion as the beam material. A plurality of wires formed from an inorganic composition are positioned between opposed beams so that the wires are uniformly spaced and form a grid. A plurality of hold down straps are formed of inorganic material such as ceramic or glass having substantially the same chemical and thermal properties as the beam material. Hold down straps overlie wires extending over the beams and are bonded thereto with inorganic bonding material.

21453 (NASA-CR—165061) **Investigations of flowfields found in typical combustor geometries.** Lilley, D.G.; Mclaughlin, D.K. (Oklahoma State Univ., Stillwater (USA)). Jul 1981. 243p. NTIS, PC A11/MF A01.

The flowfields of gas turbine combustion chambers were investigated. Six flowfield configurations with sidewall angles alpha 90 and 45 deg. and swirl vane angles phi 0, 45 and 70 deg. are characterized. Photography of neutrally-buoyant helium-filled soap bubbles, tufts, and injected smoke helps to characterize the time-mean streamlines, recirculation zones and regions of highly turbulent flow. Five-hole pitot probe pressure measurements allow the determination of time-mean velocities u, v and w. An advanced computer code equipped with a standard two-equation kappa-epsilon turbulence model was used to predict corresponding flow situations and to compare results with the experimental data.

21454 (NASA-TM—82845) **Evaluation of inelastic constitutive models for nonlinear structural analysis.** Kaufman, A. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1982. 22p. (E—1215). NTIS, PC A02/MF A01.

The influence of inelastic material models on computed stress-strain states, and therefore predicted lives, was studied for thermomechanically loaded structures. Nonlinear structural analyses were performed on a fatigue specimen which had been subjected to thermal cycling in fluidized beds and on a mechanically load cycled benchmark notch specimen. Four incremental plasticity creep models (isotropic, kinematic, combined isotropic kinematic, combined plus transient creep) were exercised using the MARC program. Of the plasticity models, kinematic hardening gave results most consistent with experimental observations. Life predictions using the computed strain histories at the critical location with a strainrange partitioning approach considerably overpredicted the crack initiation life of the thermal fatigue specimen.

21455 (NASA-TM—82846) **Nonlinear structural and life analyses of a combustor liner.** Moreno, V. (Pratt and Whitney Aircraft Group, East Hartford, Conn.); Meyers, G.J. (Pratt and Whitney Aircraft Group, East Hartford, Conn.); Kaufman, A. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1982. 23p. (E—1216). NTIS, PC A02/MF A01.

Three dimensional, nonlinear finite element structural analyses were performed for a simulated combustor liner specimen to assess the capability of nonlinear analyses using classical inelastic material models to represent the thermoplastic creep response of the one half scale component. Results indicate continued cyclic hardening and ratcheting while experimental data suggested a stable stress strain response after only a few loading cycles. The computed stress strain history at the critical location was put into two life prediction methods, strainrange partitioning and a Pratt and Whitney combustor life prediction method to evaluate their ability to predict cyclic crack initiation. It is found that the life prediction analyses over predicted the observed cyclic crack initiation life.

21456 **(PB—82-229667) Individual burner fuel/air ratio control optical adaptive feedback control system. Final report.** Beer, J.M.; Jacques, M.T.; Teare, J.D. (Massachusetts Inst. of Tech., Cambridge (USA). Energy Lab.). Jan 1982. 77p. NTIS, PC A05/MF A01.

Conventional combustion control systems for multiburner installations which rely on monitoring the average CO_2 and/or O_2 content of the gases have a number of inherent limitations on their ability to maintain efficient plant operation. Air infiltration into the flue or sampling lines has the same effect as an instrumental error in causing the control system to adjust the stoichiometry to an incorrect level. Even when the overall stoichiometry of the furnace is correctly and accurately controlled it is still extremely difficult to ensure that no individual burners are operating inefficiently due to local maldistributions of air or fuel, or to poor nozzle spray characteristics. The potential for fuel savings and for improved limitation of pollutant emissions has provided strong incentive for the development of individual burner fuel/air ratio control systems which would eliminate the shortcomings associated with the global control method. The present report first reviews past attempts to identify some unique property of an individual flame which can be reliably interpreted as an indicator of the flame behavior over a wide range of operating conditions. Information potentially usable in this manner could be contained in the acoustic characteristics of the flame, in the local distribution of key chemical species, or in the electromagnetic radiation or absorption behavior of regions of the flame.

21457 **(PB—82-229758) Thirty-day field tests of industrial boilers: site 5 - gas-fired low-Nox burner. Final report Mar 79-Mar 80.** Carter, W.A.; Buening, H.J. (KVB, Inc., Minneapolis, MN (USA)). May 1981. 162p. NTIS, PC A08/MF A01.

This is a final report on a test program to evaluate the long-term effectiveness of combustion modifications on industrial boilers. During previous programs, short-term tests were performed on industrial boilers to determine the effect of combustion modifications on air pollutant emissions such as NOx, SOx, CO, HC, and particulates. The objective of this program was to determine if the combustion modification techniques which were effective for short-duration tests are feasible for a longer period. The report gives results of a 30-day field test of a 24.9 MW (85,000 lb steam/hr) water tube boiler with low-NOx burners. The 30-day test was conducted with the unit firing natural gas. The mean NO emission level was 33 ng/J with a geometric dispersion of 1.12 at the high load condition.

21458 **(PB—82-229766) Thirty-day field tests of industrial boilers: site 6 - gas-fired fire-tube boiler. Final report mar 79-mar 80.** Carter, W.A.; Buening, H.J. (KVB, Inc., Minneapolis, MN (USA)). May 1981. 168p. NTIS, PC A08/MF A01.

This is a final report on a test program to evaluate the long-term effectiveness of combustion modifications on industrial boilers. During previous programs, short-term tests were performed on industrial boilers to determine the effect of combustion modifications on air pollutant emissions such as NOx, SOx, CO, HC, and particulates. The objective of this program was to determine if combustion modification techniques which were effective for short-duration tests are feasible for a longer period. The report gives results of a long-duration field test of a 200-hp fire-tube boiler using low excess air as the NOx control technology. The field test was conducted with the unit firing natural gas and with the normal duty cycle. The mean NO level for the 24-day test was 29.5 ng/J with a geometric dispersion of 1.05.

21459 **(PB—82-230715) Effects of fuel properties and atomization parameters on Nox control for heavy liquid fuel fired package boilers. Final report Jan 77-Jan 79.** England, G.C.; Pershing, D.W.; Heap, M.P.; Cichanowicz, J.E. (Energy and Environmental Research Corp., Santa Ana, CA (USA)). Apr 1982. 450p. NTIS, PC A19/MF A01.

The report gives information necessary for development and generalization of low-NOx oil burner technology for package fire-tube boilers. It gives results of experiments at two scales: 20 kW and 1.08 MW heat input. At 20 kW, effects of fuel properties were examined in tests of 3 distillate oils, 13 petroleum-derived residual fuel oils, 3 alternate liquid fuels, and 14 doped and/or blended liquid fuels. The tests included systematic variation of excess air and drop size distribution, normal and staged combustion conditions, and separation of fuel NOx from total NOx. At 1.08 MW, experiments concentrated on the interaction between spray characteristics and the combustion aerodynamic flowfield. Spray characteristics were varied by using different commercial atomizing nozzles and by adjusting nozzle operating conditions. Combustion flowfield was varied by modifying the swirl level on the combustion air.

21460 **(PB—82-231077) Industrial boiler combustion modification Nox controls. Volume I: environmental assessment. Final report Jan 78-Jul 79.** Lim, K.J.; Castaldini, C.; Lips, H.P. (Acurex Corp., Mountain View, CA (USA). Energy and Environmental Div.). Jul 1981. 393p. NTIS, PC A17/MF A01.

The report gives results of an environmental assessment of combustion modification techniques for coal-, oil-, and gas-fired industrial boilers, with respect to NOx control reduction effectiveness, operational impact, thermal efficiency impact, capital and annualized operating costs, and effect on emissions of pollutants other than NOx. Major industrial boiler design types and equipment trends are reviewed. Currently available control techniques can reduce NOx 10-25% for coal- and residual-oil-fired boilers, and 40-70% for distillate-oil- and gas-fired units with minimal adverse operating impacts. Controls should increase steam costs by only 1-2%, but the initial investment required could be significant, up to 20% on a new boiler and easily up to 40% on a retrofit. Detailed Level 1 tests on two stoker-coal-fired boilers indicate that combustion modification reduces the potential environmental hazard of the source by lowering NOx emissions, without significant effect on the emissions of other pollutants.

21461 **(PB—82-231085) Industrial boiler combustion modification Nox controls. Volume II: stoker-coal-fired boiler field test - Site A. Final report Jul 78-Jul 79.** Goldberg, P.M.; Higginbotham, E.B. (Acurex Corp., Mountain View, CA (USA). Energy and Environmental Div.). Jul 1981. 182p. NTIS, PC A09/MF A01.

The report gives methods and results of an environmental assessment test program at an industrial site. The aim of the program was to measure multimedia emissions changes as a result of applying NOx controls. Emissions of trace elements, organic materials, sulfur species, SO_2, NOx, CO, and particulate matter were measured. These emissions, under normal and controlled (for NOx) operating conditions, were compared. Source operating data were also analyzed so that changes in operating parameters and efficiency could be assessed. This unit is a spreader-stoker coal-fired boiler rated at 38 kg/s (300,000 lb/hr) of steam. The fuel tested was low-sulfur coal. High overfire air firing (constant overall air flow) was used for NOx control. These measures reduced NOx by about 10% from baseline. Increased overfire air levels also improved boiler efficiency. These tests lasted about 5 hours; long-term operation under test conditions was not addressed in this program. Test results suggest that applying combustion modification NOx controls increased particulate and organic emissions.

21462 **(PB—82-231093) Industrial boiler combustion modification Nox controls. Volume III: stoker-coal-fired boiler field test - Site B. Final report Jul 78-Jul 79.** Lips, H.I.; Higginbotham, E.B. (Acurex Corp., Mountain View, CA (USA). Energy and Environmental Div.). Jul 1981. 205p. NTIS, PC A10/MF A01.

The report gives methods and results of an environmental assessment test program at an industrial site. The aim of the program was to measure multimedia emissions changes as a result of applying NOx controls. Emissions of trace elements, organic materials, sulfur species, SO2, NOx, CO, and particulate matter were measured. These emissions, under normal and controlled (for NOx) were compared. Test results show that applying combustion modification NOx controls did not affect total particulate emissions from ESP outlet or sulfur species emissions. Some changes in trace element partitioning occurred with the application of NOx controls. Bioassays of ash samples for LEA operation had low or nondetectable toxicity/mutagenicity.

21463 **(PB—82-240185) Technology overview: circulating fluidized-bed combustion. Final report.** Roeck, D.R. (GCA Corp., Bedford, MA (USA). GCA Technology Div.). Jun 1982. 62p. NTIS, PC A04/MF A01.

The report summarizes the current technical status of circulating fluidized-bed combustion (CFBC). Companies that are involved in investigating this technology and/or developing commercial systems are discussed, along with system descriptions and available cost information. CFBC is a second-generation FBC system that is well underway toward commercialization in the U.S. The CFB operates at higher fluidization velocity, lower mean bed particle size, and higher recirculation rate than conventional FBC. Probable advantages of CFBC over traditional FBC include: more flexibility in fuel selection, reduced number of fuel feed points, higher combustion efficiency, better calcium utilization, and lower NOx emissions. Potential process limitations that must still be evaluated, however, include equipment erosion due to the more severe operating conditions, separation of bed material from effluent gas, severity of cyclone separation equipment design, and power requirements for process and auxiliary equipment operation. Battelle Development, Lurgi, and Pyropower are the major companies involved in demonstrating the commercial viability of this process in the U.S. Lurgi and Pyropower are basing their CFB systems on technology already commercially demonstrated in Europe; after pilot-proving its process, Battelle is building the first commercial U.S. plant.

4220 Underground Engineering

REFER ALSO TO CITATION(S) 19613

21464 **(SAND—82-0599) Development of an ice-penetration model.** Hightower, M.M.; Norwood, F.R.; Young, C.W. (Sandia National Labs., Albuquerque, NM (USA)). Dec 1982. Contract AC04-76DP00789. 46p. NTIS, PC A03/MF A01. Order Number DE83007316.

In May 1981, Sandia National Laboratories and the United States Naval Surface Weapons Center (NSWC), Silver Sprngs, Maryland, established a program to evaluate various analytcal methods to predict penetrator motion during normal impact into ice. To accomplish this, a constitutive equation for ice was deduced from existing material property data and an ice penetration model was developed. This model was used to calculate penetrator performance and loading for several ice penetration tests. These calculations were then compared to the experimental data.

4230 Marine Engineering

21465 **(AD-A—115462/4) Flow-induced oscillations of OTEC mooring and anchoring cables: state of the art. Final report.** Griffin, O.M. (Naval Research Lab., Washington, DC (USA)). 27 May 1982. 88p. (NRL-MR—4766). NTIS, PC A05/MF A01.

The objective of this report is to present an overview of the state of knowledge concerned with marine cable strumming oscillations and to apply these finding of the development of design methods for deep ocean cable systems. The report emphasizes recent findings that are relevant to the design of OTEC power plant mooring and riser cable systems. This report is limited in scope to the problems caused by vortex shedding from bluff, flexible structures and cables in steady currents, and the resulting vortex-excited oscillations. Emphasis is placed on outlining the important aspects of the basic phenomena, the development of design procedures, the definition of hydrodynamic force coefficients applicable in practice, and the specification of structural response parameters relevant to marine cable system design.

4240 Pollution Control Equipment

REFER ALSO TO CITATION(S) 19434, 19588, 19593, 20305, 21457, 21458, 21459, 21460, 21461, 21462, 21704, 21757, 21790

21466 **(PB—82-227356) Regulatory impact analysis of the national ambient air quality standards for carbon monoxide. Final report.** Henning, B. (Energy and Environmental Analysis, Inc., Arlington, VA (USA)). 2 Apr 1980. 189p. NTIS, PC A09/MF A01.

This report presents economic impact information for alternative eight-hour carbon monoxide national ambient air quality standards. The alternatives are 7 ppm, 9 ppm, and 12 ppm (on a daily maximum basis, where the highest eight-hour average for a day is used to determine if the expected number of exceedances of the standard is less than or equal to one per year). An Urban and Community Impact standard is included as part of the report. Cost and economic impacts of CO emission controls on selected industries were investigated. The analyses included capital and annualized control costs, availability of financial capital for control requirements, and potential product price and output impacts.

21467 **(PML—1980-77) Porous polymers as new sorptive materials.** Medema, J.; Vanbokhoven, J.J.G.M. (Prins Maurits Lab. TNO, Rijswijk (Netherlands)). Oct 1980. 18p. NTIS, PC A02/MF A01.

Porous polymers are compared with active carbon for the adsorption of harmful compounds from the atmosphere. Factors determining the character of porous polymers are discussed, and results regarding adsorption capacity is described. Literature data and adsorption tests were used. The main factors which characterize the polymer are solvent type and degree of crosslinking. Active groups do not influence the physical adsorption capapcity very much. Water vapor adsorption on porous polymers is extremly low. The rate of adsorption on a good porous polymer is considerably lower than the rate of adsorption into active carbon. (ESA)

21468 **Parameters influencing the collection efficiency of solid aerosols in cascade impactor.** Boulaud, D.; Diouri, M.; Madelaine, G. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

The calibration of the Mark II ANDERSEN impactor brought out the following conclusions: The nature of the collection surface is very important. The parasitic effects of particles bounce and blow-off are reduced by using grease coated plates. The aerosol mass previously deposited on the collection plates are also very important. Collection efficiency curves are slightly modified when the mass loading reach 5 mg but this modification remains acceptable until 40 mg. The electrostatic effect is weak when the number of charges is below 1000 by particles. In optimal conditions sharp cut-off was obtained for all stages. The comparison between theoretical and experimental results shows that they are in good agreement (except for the first stage).

21469 **Bipolar current probe and its application in electrostatic precipitators for diagnosis of back discharge severity.** Masuda, S. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

As the parameters of expressing the severity of back discharge, the degraded value of the field intensity, E, and the positive and negative ionic current densities, J+ and J-, are proposed, based on the charging and charge-neutralization processes in the bi-ionized field. Then, a bipolar current probe for measuring J+ and J- is described with its probe theory and some of the measuring results. Finally, the experimental verifications of the relationships holding between the charge and performance degradation factors and the probe-measured values of J+ and J- are presented. Although the laboratory results cannot immediately be extended to the practical plants, the bipolar current probe seems to provide one of the useful means for diagnosis of back discharge severity.

21470 **Equivalence of low pressure impactor and differential mobility analyzer data for submicron particle size distributions.** Reischl, G.P. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

21471 (EUR—7159-EN) **Experimental Rankine cycle engine designed for heat recovery from exhaust gases of industrial plants.** Cipolla, G. (Commission of the European Communities, Luxembourg). 1981. 233p. Available from the Commission of the European Communities, Luxembourg.

This report describes the development of, and the results obtained from, an Organic Research Cycle (ORC) engine in order to assess its feasibility; the subject research program is the extention of the activities carried out in the frame of the previous EC Contract n° 196-76 EEi. In particular the following activities have been carried out: - engine and test rig desing and set up - working fluid and thermodynamic cycle choice - engine performance and mechanical behaviour evaluation - laboratory investigation on chemical compatibility and thermal stability of the candidate working fluids. Engine performance has been evaluated using two different fluids: Freon 11 and perfluorohexane. The main results of the experimental investigation performed are: - engine performance in good agreement with the calculated values - mechanical behaviour of main components almost satisfactory - working fluid problems: Freon 11 in fact has proved not to be completely reliable in the higher temperatures range, but very interesting from the performance point of view. Perfluorohexane, on the other hand, has shown very good stability up to 250°C, but it isn't fit for a simple non-regenerative cycle engine and very expansive.

21472 (BNL—32531) **Laser-driven grating linac.** Palmer, R.B. (Brookhaven National Lab., Upton, NY (USA)). 1982. Contract AC02-76CH00016. 18p. (CONF-820980—5). NTIS, PC A02/MF A01. Order Number DE83007389.

From European Committee of future accelerators - the challenge of ultra-high energies conference; Oxford, UK (27 Sep 1982).

I would like to consider a 50 TeV on 50 TeV collider. Even a hadron machine with such an energy seems unrealistic with current technology. Magnetic fields higher than 10 Tesla are difficult and at this field the circumference would be 120 km. I conclude that only a high gradient Linac could be practical and that one should aim for 10 GeV/meter so as to keep the total length down to the order ot 10 km. Currently it is only plausible to obtain such fields using the very high energy densities produced by lasers. The luminosity is another issue. I aim for 10^{33} to 10^{34} but I am conscious that higher luminosities than even these are really desired, especially for an e^+e^- machine. I tend to assume that the machine is an e^+e^- machine but it will also accept hadrons.

21473 (CONF-8010206—Vol.1, pp 23-31) **Industrial and medicine accelerators and prospects of their development in the 11 five year plan.** Vakhrushin, Yu.P.; Glukhikh, V.A.; Svin'in, M.P. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

The data on development and introduction of accelerators into industry and medicine, improvement of their technical-and-economic factors are presented. A parametric series of high-voltage electron accelerators which includes seven models covering the 0.15-4 MeV energy range, is developed. A common series of linear resonance accelerators for non-destructive testing, radio-therapy, activation analysis and radiation technology cover the 3-40 MeV electron energy range. The series includes 12 modifications of accelerators made of unified modules. A linear induction accelerator with up to 200 kW average beam power for using in an installation for liquid waste decontamination is under development. A parametric series of cyclotrons for industry and medicine using electron beams at 6-220 MeV energy and up to 200 μA current is developed.

21474 (FERMILAB-CONF—82/77-THY) **Remarks on future accelerators and future physics.** Bjorken, J.D. (Fermi National Accelerator Lab., Batavia, IL (USA)). Sep 1982. Contract AC02-76CH03000. 9p. (CONF-820980—4). NTIS, PC A02/MF A01. Order Number DE83006643.

From European Committee of future accelerators - the challenge of ultra-high energies conference; Oxford, UK (27 Sep 1982).

Speculations are given on the future of high energy accelerators. (GHT)

21475 (LA—9572-C-Vol.2, pp 552-559) **Muon storage ring for LAMPF II.** Neuffer, D. (Fermilab, Batavia, IL). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

A muon storage ring is suggested as a possible tool in search for neutrino oscillations at LAMPF II. The same system can also be used for precision nu-interaction measurements and for anti p accumulation. Parameters of a sample system are described.

21476 (LA—9572-C-Vol.2, pp 619-642) **Physics with intense antiproton beams.** Kalogeropoulos, T. (Syracuse Univ., NY). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

The discussion considers two types of beams, time separated (TSB) and cooled beams of antiprotons. Two TSB beams are considered for LAMPF II, stopping, and low and medium energy. The relative costs are considered. The standard nucleon-antinucleon research programs include: atomic captures; baryonium; phase shifts; final state interactions; and nuclear. The non-standard program includes: EM interactions; charm; proton form factor in the time-like region; two-photon physics; 1-2 GeV spectroscopy; tagged beams of π^0, K, lambda, anti lambda for weak interaction experiments; π^0, K^+, K^-, K^0 tagged beams; symmetric lambda, anti lambda tagging; antineutron tagged beams; antideuterons; and biomedical applications. (GHT)

21480 (AD-A—117975/3) **KMRAD: a linearized particle code for the study of resistive instabilities. Final technical report.** Hughes, T.P.; Godfrey, B.B. (Mission Research Corp., Albuquerque, NM (USA)). May 1982. 29p. NTIS, PC A03/MF A01.

A linearized electromagnetic particle simulation code KMRAD has been developed to look at resistive instabilities on electron beams. The code can simulate three-dimensional dynamics, but by use of Fourier transforms in two directions, only one spatial direction needs to be resolved. For cold beam equilibria, KMRAD predicts growth rates which closely agree with those obtained from an exact cold-fluid code. For a Bennett equilibrium, comparisons between KMRAD and available analytic models are presented, and several discrepancies are noted.

21481 (AD-A—118056/1) **Resistive wall instabilities in the modified betatron. Revision 1. Interim report.** Godfrey, B.B.; Hughes, T.P. (Mission Research Corp., Albuquerque, NM (USA)). Apr 1982. 13p. NTIS, PC A02/MF A01.

Resistive wall instabilities in modified betatrons are analyzed in several limits. The moderate frequency, negative energy, $m=1$ spacecharge and cyclotron waves are found to be most dangerous, potentially capable of disrupting acceleration for typical betatrons parameters. A moderate spread in electron energy can, however, stabilize these modes.

21482 (AD-A—119869/6) **Equilibrium of a high current electron ring in a modified betatron accelerator. Memorandum report.** Kapetanakos, C.A.; Sprangle, P.; Chernin, D.P.; Marsh, S.J.; Haber, I. (Naval Research Lab., Washington, DC (USA)). 30 Sep 1982. 72p. (NRL-MR—4905). NTIS, PC A04/MF A01.

This paper addresses the dynamics of an ultra-high current electron ring in a modified betatron configuration. Our studies include analytical and numerical results for both 'cold' and 'hot' rings. It has been found that the walls surrounding the ring and toroidal effects (hoop stresses) play a very important role in the dynamics of the ring, even when the wall conductivity is infinite. For finite wall conductivity, the diffusion of the ring's self magnetic field profoundly impacts its dynamics in general the equilibrium could be lost if means are not provided to compensate for this effect. In addition, it has been found that the Grad B drift is not important, except when the bounce frequency is very small. The general conclusion of these studies is that equilibrium states of ultra-high current rings in a modified betatron configuration exist over a wide range of parameters. These states are accessible and within the realm of existing pulsed power technology.

21483 (ANL/NESC—944) **SATDSK; saturated iron magnetic field study.** McNeilly, G.S. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048944.

Maxima of - 1001 points in the poletip arrays 100 poletip gap steps 17 magnetic charge disks Magnetic fields are calculated only in the median plane for median-plane-symmetric iron poletips.

SATDSK is designed to calculate the median plane magnetic field in superconducting cyclotrons due to fully saturated iron poletips. Optionally, the program calculates the magnetic field due to disks of magnetic "charge", which can simulate the effect of holes in the iron poletips or circular trim rods embedded in the poletip. SATDSK is intended for poletip geometries that are both symmetric about the median plane and have azimuthal sector symmetry.IBM360,370,303x; FORTRAN IV (89%) and Assembly language (11%); OS/MVT, OS/MVS; 165K bytes of memory are required to execute the program.

21484 (BNL—32546) **Higher-order modes calculation of rf cavity with cylindrical symmetry.** Zhou, W.; Xuanwen, C.; Mingda, Z. (Brookhaven National Lab., Upton, NY (USA); Zhejiang Univ., Hangzhou (China)). 1983. Contract AC02-76CH00016. 4p. (CONF-830311—4). NTIS, PC A02/MF A01. Order Number DE83007394.

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

This paper represents a new computer calculating method for cylindrical symmetry cavities. This method can calculate not only the fundamental mode and longitudinal modes but also the transverse higher modes. The Hertz vector is used as fundamental quantity and the separated variable method is applied. An empty cylindrical cavity has been calculated. The calculating result is in accord with analytic solution fairly well.

21485 (BNL—51610) **Effects of magnetic non-linearities on a stored proton beam and their implications for superconducting storage rings.** Cornacchia, M.; Evans, L. (Brookhaven National Lab., Upton, NY (USA)). 7 Oct 1982. Contract AC02-76CH00016. 40p. NTIS, PC A03/MF A01. Order Number DE83008471.

In this report we describe an experiment which was conducted at the SPS to observe the combined effects of a single isolated high-order nonlinear resonance, nonlinear detuning, and tune modulation. The nonlinear resonance, as well as the nonlinear detuning, was driven by a nonlinear lens, which had been previously used at the SPS for the study of the beam-beam interactions. The nonlinear motion of a particle in the field of the lens is discussed.

21486 (CONF-8010206—Vol.1, pp 279-283) **Stochastic spreading of longitudinal phase density in proton bunch longtime confining.** Gurov, G.G. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij); Kotin, V.V. (Moskovskij Inzhenerno-Fizicheskij Inst. (USSR)). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

Proton beam spreading inside a high-frequency packet under the effect of parametric noise during durable proton bunch confinement in the synchrotron is considered. A wide-band noise, which spectrum is rather close to a nonuniform one and limited by a bandwidth of accelerating devices of the synchrotron is considered as a perturbation of the HF voltage amplitude providing a proton beam bunched structure in the circulation mode. Evolution of a longitudinal particle distribution in a bunch is studied using the Eeinstein-Fokker equation. At the 90 Hz phase oscillation frequency, 1% per minute limiting permissible loss rate and parabolic initial distribution the $1.49\text{x}10^{-5}$ Hzsup(-1/2) spectral density tolerance of parametric noise is obtained.

21487 (CONF-8010206—Vol.1, pp 331-333) **Peculiarities of magnetic field formation in a dipole magnet of the first stage of the accelerating-storage complex.** Dojnikov, N.I.; Kashikhin, V.S.; Popov, A.V.; Puzynovich, Yu.T.; Samsonov, G.N. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)); Dajkovskij, A.G.; Portugalov, Yu.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

To ground the accuracy of the numerical methods the magnetic field of a dipole magnet of the first stage of a designing accelerating- storage facility is calculated. The choice of the magnet pole profile is based on the approximation of infinitely large permeability. The following profile modifications are considered: a rectangular and a close to rectangular with round off angles. Investigations of the magnetic field are carried out according to the different computer codes using through irregular grids (triangular and rectangular) and providing a continuous transition to the μ=infinity. It is shown that the accuracy of the numerical methods for induction varying within the 0.1-1 T range is 10^{-4}.

21488 (CONF-8010206—Vol.1, pp 217-219) **Self-consistent theory of intense beam acceleration in beam bunching sections.** Ajzatskij, N.I.; Makhnenko, L.A. (AN Ukrainskoj SSR, Kharkov. Fiziko-Tekhnicheskij Inst.)). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

The results of calculation of current loading for a relativistic electron beam accelerated in the bunching section of the LUE-300 electron linac are presented. The section is a piece of a diaphragmatic waveguide of the 80 cm length, the operating type of a travelling wave is $\pi/2$. The effect of the electron beam on its acceleration is taken into account on the basis of a self-consistent description of the particle dynamics in a field being a superposition of the external generator field and fields generated by the beam particles at the given frequency. it is shown that during beam acceleration there is some limiting value of accelerated current, equal to 2.8 A, starting from which the acceleration process becomes inefficient. A particle bunch being accelerated is strongly deformed.

21489 (CONF-8010206—Vol.1, pp 209-212) **Dynamics of positron beam from a convertor target while beam additional accelerating in a travelling wave electron linac.** Dzhilavyan, L.Z. (AN SSSR, Moscow. Inst. Yadernykh Issledovanij); Karev, A.I. (AN SSSR, Moscow. Fizicheskij Inst.). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

The results of experimental and theoretical investigations of the dynamics of a positron beam produced in a tantalum converter of the 6 mm thickness in the process of beam reacceleration in an electron linac (ELA) are presented. The mean finite positron currents and their dependences on the accelerating electric field are measured. The energy spectra of accelerated positrons are given. A good agreement between the calculated and experimental data is shown. As a result of investigations some peculiarities of positron production on the ELA intersection targets, which are defined by both the initial positron beam parameters from the converter and the dynamics of positron reacceleration in the ELA.

21490 (CONF-8010206—Vol.1, pp 220-223) **Self-consistent interaction of a set of ion extended bunches with a multigap resonator.** Vyalov, G.N.; Senichev, Yu.V. (AN SSSR, Moscow. Inst. Yadernykh Issledovanij). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

The dependence of a HF field induced by a high-current proton beam on the beam injection phase at the resonator input and on the final bunch length is numerically studied. The problem is solved for resonators of the second part of the meson factory of the Institute of Nuclear Research of the Academy of Sciences of the USSR. The four elements are considered in the model of beam interaction with the resonator, which are the following: a resonator, a beam, a HF generator and a waveguide section. The resonator is considered in a one-mode approximation. The beam was simulated in a two-dimensional longitudinal phase space. Coulomb interaction is not taken into account. The iteration method is used in calculations. It is shown that the results obtained permit to determine the effect of the vortical component of the proper field on bunch motion in the resonator, that is important for developing HF systems and systems of automation control of parameters of the accelerating field used in high-current accele-- rators.

21491 **(FERMILAB-CONF—82/65-THY) Polarized e^{+-} - polarized p colliding beams: physics issues.** Bjorken, J.D. (Fermi National Accelerator Lab., Batavia, IL (USA)). Sep 1982. Contract AC02-76CH03000. 13p. (CONF-820941—12). NTIS, PC A02/MF A01. Order Number DE83006645.

From 5. international symposium on high energy spin physics; Upton, NY, USA (16 Sep 1982).

The physics of collisions of polarized electrons with polarized protons at storage-ring energies is examined, with emphasis on polarization asymmetries of structure functions. The usefulness of positron-proton as well as electron-proton collisions is underlined.

21492 **(GSI—82-7) Derivation of an elementary RFQ formula.** Funk, L.W.; Mueller, R.W. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Jul 1982. 15p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE83750187.

The purpose of this short note is to derive a few of the basic formulae which relate to RFQ behaviour.

21493 **(Juel—1772) Mathematical and numerical methods for the nonlinear hyperbolic propagation problem: d^2GAMMA/dt^2 = d/dz [dGAMMA/dt dGAMMA/dz].** Stanco, L.; Vaccaro, V.G.; Funk, U.; Krueger, U.; Mika, K.; Wuestefeld, G. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Festkoerperforschung). Mar 1982. 173p. NTIS (US Sales Only), PC A08/MF A01. Order Number DE83750195.

In the first part of this report a physical model is presented, which describes the deforming of a bunch in a storage ring influenced only by its own space charge field. A system of two differential equations for the density and the momentum of the particles is set up, which is independent of any special machine parameter. Due to the sign of the inductance of the chamber walls and the sign of the dispersion of the revolution frequency, we distinguish between a de-bunching and a self-bunching situation. The debunching corresponds to a nonlinear hyperbolic propagation problem well-known in gas dynamics, and the self-bunching to a nonlinear elliptic initial value problem. The second part deals with a mathematical and numerical treatment of an approximate equation for the hyperbolic case. For this nonlinear second order partial differential equation we first present three particular integrals: the solution by separating the variables, the similarity solution, and the solution for a parabolic initial distribution of the density. For a more realistic initial condition, we must resort to other methods: Results are obtained in three different ways, first from a highly accurate Taylor series expansion, second from a common finite difference method, and thirdly from the numerical method of characteristics. The appearance of a shock discontinuity is furthermore established in each of these cases.

21494 **(LA—9621-MS) LAMPF II main-ring lattice with low transition energy.** Garren, A. (Los Alamos National Lab., NM (USA)). Dec 1982. Contract W-7405-ENG-36. 10p. NTIS, PC A02/MF A01. Order Number DE83007099.

A main-ring lattice that avoids crossing transition energy during acceleration when injected by a low-energy booster is discussed. Included in the report are a list of parameters, plots of lattice and orbit functions, and output from program SYNCH.

21495 **(UCRL—88737) Microwave generator experiment at LLNL.** Hofer, W.W.; Burkhart S.C.; Scarpetti, R.D. (Lawrence Livermore National Lab., CA (USA)). 14 Feb 1983. Contract W-7405-ENG-48. 10p. (CONF-830314—3). NTIS, PC A02/MF A01. Order Number DE83007348.

From 2. national conference on high power microwave technology; Adelphi, MD, USA (1 Mar 1983).

A high power microwave oscillator known as a Virtual Cathode Oscillator (VIRCATOR) is described here. It is basically a space charge limited field emission cathode injecting electrons through a thin foil into a 4.3 cm radius circular waveguide. The total injected current forms a potential which exceeds the electron energy at which point a virtual cathode forms, and the electrons are reflected back across the foil. This occurs cyclically, coupling energy into TM/sub on/ waveguide modes. The frequency and power of the oscillations are very dependent on geometry and driving voltage. The VIRCATOR is presented here in two parts. First, the VIRCATOR theory and experiment setup is discussed, then numerical analysis of various VIRCATOR geometries is shown.

21496 **Bunch diffusion due to rf noise.** Krinsky, S.; Wang, J.M. (Brookhaven National Lab., Upton, NY (USA)). *Particle Accelerators;* **12**: No. 2, 107-117(Jul 1982).

A treatment of the influence of rf noise on a proton bunch valid for an arbitrary rf potential is presented. The approach is based upon the Hamilton-Jacobi transformation, followed by an application of canonical perturbation theory. A general proof is presented for the relation $A_1 = 1/2$deltaA$_2$/deltaJ, recently considered by Boussard, Dome and Graziani (Proc. X1th international conf. on High Energy Accelerators, Geneva, 1980, p620.). Some properties of the solutions of the Fokker-Planck equation describing the diffusion of small bunches are considered.

21497 **(CAPE—2711) Prebuncher-main injector assembly (single electron gun) (Engineering Materials).** (591 0000). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83006001.

This drawing set supplies drawings and specifications for the construction and installation of the prebuncher used on the SLAC 3-kilometer linear accelerator. The prebuncher is an rf-driven cavity which bunches the electron stream emanating from the electron gun and is located between the gun and the main injector accelerator section where the remaining bunching is accomplished. The prebuncher is capable of bunching 75% of the charge into bunches of 100 electrical degrees or 60% of the charge into bunches of 60 electrical degrees at 2856 MHz.

21498 **(ANL—83-13-Add.) Conceptual design of a rapid-cycling synchrotron for the KFA-Juelich spallation neutron source: working papers.** (Argonne National Lab., IL (USA)). Jan 1983. Contract W-31-109-ENG-38. 444p. NTIS, PC A19/MF A01. Order Number DE83007899.

An accelerator group was established at ANL by the request of KFA-Juelich to carry out a conceptual design study and cost estimate for a rapid-cycling synchrotron as a possible first stage program on spallation neutron sources at KFA-Juelich. This set of notes is the individual notes which form the basis of the final report under this proposal prepared in January 1983. The topics covered include: SNQ Synchrotron Lattice-I; injection and extraction orbit; extraction from SNQ-SRA; SRA injection; capture and acceleration considerations in the SNQ-SRA; longitudinal coupling impedance; power supplies for SNQ synchrotron proposals; space charge limits in the SNQ-SRA; error analysis; SNQ-SRA ring magnets preliminary designs and cost; summary of CERN booster 4-ring arrangement; V-lattices for SNQ-SRA and extraction from the V-lattices; rf parameters for capture, acceleration and extraction; some parameters of the SNQ-SRA injector system; Keil-Schnell criterion; risetime of longitudinal resistive wall instability; beam scrapers; a design of the vacuum system; some aspects of vacuum consideration for SNQ-SRA; choice working points; ring magnet power supplies for shaped extaction of 1.1 GeV SNQ; ring magnet design and costs; tune shift due to the fringing field of the quadrupoles; coherent instability due to ions in the residual gas; transverse stabilization of bunched beams; rf acceleration system; injection into the SRA; Landau damping to get transverse stability; chromaticity and amplitude dependent tune controls in the SNQ-SRA; conversion of the SNQ-SRA to a compressor ring; comments on beam loss; summary of longitudinal stability study and transverse stability study for the SNQ-SRA; and the beam stay clear regions of the SNQ-SRA. (GHT)

21499 **(BNL—32344) Improved four-stage accel-decel production of low-energy stripped heavy ions.** Thieberger, P.; Barrette, J.; Johnson, B.M.; Jones, K.W.; Meron, M.; Wegner, H.E. (Brookhaven National Lab., Upton, NY (USA)). 1982. Contract AC02-76CH00016. 3p. (CONF-821123—36). NTIS, PC A02. Order Number DE83005791.

From 7. conference on the application of accelerators in research and industry; Denton, TX, USA (8 Nov 1982).

The two model MP Tandem Van de Graaff accelerators at Brookhaven have been used in a four-stage accel-decel configuration to produce highly stripped low energy heavy ions. The performance in this mode of operation has now been substantially improved by modifications of the second accelerator. The inclined field acceleration tube electrodes at the exit of this accelerator were replaced by straight electrodes, the vacuum was improved and the maximum negative terminal potential was increased. Higher intensity beams of heavier highly stripped ions can now be produced at lower energies than before.

21500 **(BNL—32559) Status reports on ISABELLE magnets.** Palmer, R.B.; Baggett, N.; Dahl, P.F. (Brookhaven National Lab., Upton, NY (USA)). 1982. Contract AC02-76CH00016. 6p. (CONF-821108—22). NTIS, PC A02/MF A01. Order Number DE83007386.

From Applied superconductivity conference; Knoxville, TN, USA (30 Nov 1982).

The design of the ISABELLE Palmer magnets is described. The performance of thirteen such magnets is reported. Average quench fields of 55 kG at 4.5°K have been obtained with essentially no training. The magnets can be shown to be limited only by the short sample characteristics of the cable. Required field quality was achieved in the last four magnets.

21501 **(CONF-810314—175) Development of superconducting resonators for the Argonne heavy-ion linac.** Shepard, K.W. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01. Order Number DE83007798.

From Particle accelerator conference; Washington, DC, USA (11 Mar 1981).

Recent developments include a method for conditioning resonators which has produced a significant increase in accelerating gradient and also a design for a split-ring resonator with an optimum particle velocity of 0.16 c. Results of using a 1500 watt rf source to condition superconducting split-ring resonators are described. By repetitively pulsing for a few msec to field levels as high as an 8 MV/m effective accelerating field E/sub a/, electron loading at high field levels has been substantially reduced. After such conditioning, continuous operation at E/sub a/ > 6 MV/m, corresponding to a peak surface electric field of 30 MV/m, has been obtained. A split-ring resonator designed for an optimum particle velocity $\beta = v/c = 0.16$ is also described. The 145.5 MHz resonator is contained in the same 16 inch diameter, 14 inch length housing used for the $\beta = 0.1$ Argonne split-ring. In design of the split ring element, a 20% reduction in peak surface electric field has been achieved with no significant increase in surface magnetic field.

21502 **(CONF-810835—47) Cooling the ANL SC heavy-ion linac with two refrigerators in parallel. Preprint Paper G-26.** Nixon, J.M.; Bollinger, L.M. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 9p. NTIS, PC A02/MF A01. Order Number DE83007932.

From 1981 cryogenic engineering conference; San Diego, CA, USA (10 Aug 1981).

The Argonne Superconducting Heavy-Ion Linac consists of a series of niobium accelerating resonators grouped in cryostats. The resonators are cooled by a forced-circulation flow of liquid helium directly from a CTI Model 1400 refrigerator through a low-loss distribution line. Helium entering each cryostat is condensed to near liquid saturation by heat exchange with the colder, lower pressure return stream. As more resonators and cryostats have been added to the linac over the past few years, it has been necessary to increase the cooling capacity of the system without increasing the flow of helium through the outgoing primary side of the distribution line and the resonators. This has been accomplished by coupling the first operational CTI Model 2800 turbo-expander refrigerator in parallel with the Model 1400 in such a way as to avoid major modifications in the helium distribution system.

21503 (CONF-810987—2) **Materials Science Division HVEM-Tandem Facility at Argonne National Laboratory.** Taylor, A. (Argonne National Lab., IL (USA)). Oct 1981. Contract W-31-109-ENG-38. 20p. NTIS, PC A02/MF A01. Order Number DE83007852.

From 29. midwest solid state conference; Chicago, IL, USA (24 Sep 1981).

The ANL-Materials Science Division High Voltage Electron Microscope-Tandem Facility is a unique national research facility available to scientists from industry, universities, and other national laboratories, following a peer evaluation of their research proposals by the Facility Steering Committee. The principal equipment consists of a Kratos EM7 1.2-MV high voltage electron microscope, a 300-kV Texas Nuclear ion accelerator, and a National Electrostatics 2-MV Tandem accelerator. Ions from both accelerators are transmitted into the electron microscope through the ion-beam interface. Recent work at the facility is summarized.

21504 (CONF-820935—8) **Pulsed neutrons: one year of experience with the new source at Argonne National Laboratory.** Lander, G.H. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 24p. NTIS, PC A02/MF A01. Order Number DE83007736.

From 6. Yamada conference on neutron scattering of condensed matter; Tokyo, Japan (1 Sep 1982).

The Intense Pulsed Neutron Source (IPNS) at Argonne National Laboratory is a spallation neutron source based on a 500-MeV proton accelerator operating at 30 Hz and with an average proton current of ~ 10 μA. Neutron-scattering instruments for elastic scattering include two powder diffractometers, a single-crystal diffractometer based on the Laue method and employing a large (30 x 30 cm) position-sensitive scintillation detector, a small-angle diffractometer using a position-sensitive detector, and a polarized-neutron diffractometer which will utilize the spin-refrigerator device to obtain a beam of white polarized neutrons. For inelastic scattering, we presently have the crystal-analyzer spectrometer and two chopper spectrometers capable of providing monoenergetic incident neutron beams of between 100 and 600 MeV. From its inception IPNS has been operating in a user mode and the selection of experiments is made by a Program Committee twice a year on the basis of the scientific merit of submitted proposals.

21505 (CONF-8010206—Vol.1, pp 133-136) **Measuring the ion-stimulated desorption coefficient on a model of the vacuum chamber of the accelerating-storage complex at the temperature of 300 and 77 K.** Kalinin, Yu.Zh.; Rogozinskij, V.G.; Ushkov, V.L. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij)). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

For studying the vacuum-technical performance of a model of the vacuum chamber of the IHEP accelerating-storage facility the ion-stimulated desorption coefficient eta is measured. The vacuum chamber with the nitrogen coating of the 3.8 m length, 70 mm diameter and 1 mm wall thickness is made of the 12 Kh18N10T stainless steel. Glow discharge treatment of the chamber in argon is carried out at $2.5x10^{-2}$ mm Hg. eta is determined according to the ratio of the number of gas molecules extracted from the chamber walls into the gas phase during ion bombardment and the number of ions passed through the discharge during the same period of time. The eta dependences on the ion integral dose for different discharge voltages and eta dependences on the discharge voltage at 77 K and for two ion integral doses at 300 K are presented. It follows from the dependences that at first, at small ion doses, the eta coefficient has a relatively great value, and then it decreases and yields to the steady value with the ion dose increase at voltages > 1100 V. At 800 V and 500 V the eta value linearly decreases at doses higher than $6x10^{6}$ $ionxcm^{-2}$. At the fixed ion dose eta linearly increases with the ion energy increase. At 77 K temperature in the chamber the eta value, remaining negative, approaches zero with the increase of energy or ion integral dose.

21506 (CONF-8010206—Vol.1, pp 315-322) **Trends of development of charged particle accelerator power supply systems.** Vasil'ev, S.N.; Gusev, O.A.; Fedorov, V.D. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

For increasing intensity of charged particle accelerators the tendencies of development of power supply system of large proton synchrotrons of the world are considered. Statical compensators, built according to the scheme of a 3-phase ferroresonance stabilizer, providing the SPS synchrotron operation up to 500 GeV energy at a 540 MWA preset compensator power proved themselves to be good compensators of reactive power. A 12-phase .Series completely controlled circuit of a thyristor rectifier is an optimum power supply system. As a power supply system of booster ring electromagnets in the USSR, the system of active formation of a magnetic cycle using resonance discharge of capacitance and induction storage rings commutated by thyristor switches is accepted. Stabilization of the injection levels and maximum value of the magnetic field is realized by controlled thyristor transformer control. The same tendency concerns the heavy ion accelerators.

21507 (CONF-8010206—Vol.1, pp 323-326) **Problems of magnetic cycle formation in ring electromagnets of accelerating-storage complex.** Vasil'ev, S.N.; Gusev, O.A.; Gusev, G.I.; Kofman, V.M.; Lebedev, Yu.V.; Mozin, I.V.; Rozhkov, V.N.; Tunkin, A.A.; Fedorov, V.D. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

The charts of formation of magnetic cycles of ring electromagnets of the first and second stages of the 400/3O00 GeV accelerating-storage facility are presented. At the first stage particles of the energy up to 7O GeV are accumulated during 78.5 s. After acceleration up to 400 GeV the particles are transported into the second stage, where they are accelerated up to 3000 GeV and slow extraction during 40 s. Power supply of every ring electromagnet is provided by 24 controlled sources, constructed according to the 12-pulsed circuit on the base of 3.5 kA/1 kV thyristor bridge transformers. The introduction of the sources in turns into operation is realized by groups of 6 and then of 12 synchronously controlled sources. Magnetic cycle variations are performed smoothly at a restricted rate of variation of the power consumption of 100 MW/s. The block diagram of the voltage control device with the 10^{-4} accuracy of a power supply source is given. To restore a failed source in each of 12 power supply systems it is assumed to install a reserve thyristor module.

21508 (CONF-8010206—Vol.1, pp 327-330) **Magnetic field formation in a heavy ion synchrotron.** Vasil'ev, S.N.; Goncharenko, V.P.; Gusev, O.A.; Kan, Yu. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)) . 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

The principle of construction of the power supply system of the basic electromagnet of a heavy ion synchrotron are considered. The power supply system is made on the basis of a capacitance storage ring and a controlled 12-pulse thyristor transformer with a transistor-transformer transmission band stretcher connected through matching anode transformers directly to an alternating current network. The proposed power supply system permits to obtain the following current pulse parameters: the maximum current value in the booster mode is 400 A, in the slow extraction mode-3400 A, the cycle recurrent frequency is 3 Hz, the current amplitude control range is 50-120 ms; pulse duration of the flat-top during injection is 5-10 ms, the maximum rate of the field growth in the accelerating mode is 15 T/s. The electromagnet parameters are the following: the active resistance is 0.7 Ohm, the coil induction is 0.1 H. The block diagram of the automatic control system is given.

21509 (CONF-8010206—Vol.1, pp 334-337) **Results of modernization of the control and smoothing system of ITEP proton synchrotron magnetic field pulsations.** Gusev, O.A.; Gusev, G.I.; Kofman, V.M.; Rozhkov, V.N. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

The results of improvement of the magnetic field control system of the IHEP proton synchrotron are presented. As a result of modernization of different structures of the phase control systems, the asynchronous statical system parallel with the synchronous system, where the reference sweep voltage is the 180 deg biased voltage of the phase, which does not involve in commutation, ensures a considerable decrease of the rectified voltage pulsation subharmonics. The experiments on the accelerator modernized system have shown that on the magnetic field flat top the level of the subharmonic voltage pulsation components at the circular electromagnet poles is reduced down to 0.1-0.2 V. The magnetic field stability is increased up to 0.2 Oe.

21510 (CONF-8010206—Vol.1, pp 121-124) **Development of 5 T radiation-resistive pulse magnets.** Karasyuk, V.N.; Sil'vestrov, G.I. (AN SSSR, Novosibirsk. Inst. Yadernoj Fiziki). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

The construction and manufacturing method of pulsed dipole magnets with the 5T field are described. Oxidized aluminium and tantalum foils and asbestos cement plates are used as insulators. In this construction the current-carrying buses are rigidly fixed directly on iron of the magnetic core, and the insulators are carried from the bus surface to the magnet periphery. The first magnet of the 10 cm length (of the 1.25x2.5 cm aperture) is developed for separation of the initial proton beam at the 80 GeV/c momentum and the antiproton beam at the 4.5 GeV/c momentum in the FNAL antiproton target facility. The second magnet of the 60 cm length (of the 2x4 cm aperture) is developed for bending the π-meson beam at 66 GeV/c by 150 mrad and extraction from the IHEP neutron target facility. The results of tests on the short magnet sample and insulators are presented.

21511 (CONF-8010206—Vol.1, pp 91-94) **Beam storage for intensity increasing in a heavy ion synchrotron.** Nagaenko, M.G.; Reshetnikov, E.M.; Severgin, Yu.P.; Shukejlo, I.A. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

The process of heavy ion storage before injection into a synchrotron aimed at increasing its intensity, is described. The accumulation process in a simplified form is the following: a low-charged ion beam accelerated in an injector is injected into a vacuum chamber of a storage ring and it crosses a charge-exchange target installed inside the chamber. The target thickness is such that after a single crossing an equilibrium charge distribution is formed. The ions move along closed orbits which radial location corresponds to their charged states. Accumulation proceeds during hundreds of cycles. The magnetic ring scheme, which parameters correspond to conditions of uranium ion confinement at 10 MeV/nucleon energy, is described. The beam extraction scheme is shown.

21512 (CONF-8010206—Vol.1, pp 341-344) **Power supply of the B-430303;5 proton-ion synchrotron magnet.** Auslender, V.L.; Kuz'min, S.V.; Lapik, R.M.; Tomilov, V.P.; Tuvik, A.A. (AN SSSR, Novosibirsk. Inst. Yadernoj Fiziki). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

The power supply system of the B5 proton-ion synchrotron magnet where accelerator magnet magnetization is realized by permanent current, is described. Magnetization is realized by introducing a semiconductor rectifier into the magnet circuit. The direct component of the magnet current is closed through a separating reactor. There is a pause in the magnet current curve, which value is defined by the quality factor of the oscillatory circuit. The power suppy system of the magnet has the following parameters: the acceleration cycle frequency is 50 pulse/s, the magnet power capacity is 50 kJ, the maximum magnet current is 12 kA, the active losses in the circuit elements are 400 kW. The accuracy of keeping the magnetic field amplitude at the given level is +-0.1%. The flat top duration changes within the limits of zero to 600 μs.

21513 (CONF-8109205—2) **Sources of pulsed radiation.** Sauer, M.C. Jr. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 13p. NTIS, PC A02/MF A01. Order Number DE83007867.

From NATO Advanced Study Institute conference on fast processes and labile species in chemistry and molecular biology using ionizing radiation; Capri, Italy (7 Sep 1981).

Characteristics of various sources of pulsed radiation are examined from the viewpoint of their importance to the radiation chemist, and some examples of uses of such sources are mentioned. A summary is given of the application of methods of physical dosimetry to pulsed sources, and the calibration of convenient chemical dosimeters by physical dosimetry is outlined. 7 figures, 1 table.

21514 (CONF-8206118—8) **IPNS-I chopper spectrometers.** Price, D.L.; Carpenter, J.M.; Pelizzari, C.A.; Sinha, S.K.; Bresof, I.; Ostrowski, G.E. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 10p. NTIS, PC A02/MF A01. Order Number DE83007748.

From 6. annual international collaboration of advanced neutron sources meeting; Argonne, IL, USA (28 Jun 1982).

We briefly describe the layout and operation of the two chopper experiments at IPNS-I. The recent measurement on solid ^{4}He by Hilleke et al. provides examples of time-of-flight data from the Low Resolution Chopper Spectrometer.

21515 (CONF-8206118—9) **Electronically focused power diffractometers at IPNS-I.** Jorgensen, J.D.; Faber, J. (Argonne National Lab., IL (USA)). Nov 1982. Contract W-31-109-ENG-38. 15p. NTIS, PC A02/MF A01. Order Number DE83007610.

From 6. annual international collaboration of advanced neutron sources meeting; Argonne, IL, USA (28 Jun 1982).

Two powder diffractometers have been operated at IPNS-I since August 1981. The diffractometers achieve high resolution with large detector solid angles for scattering angles from +- 12 to 157° by electronically focussing the events from individual detectors in an on-line microprocessor.

21516 (CONF-8206163—1) **Accelerator mass spectrometry: from nuclear physics to dating.** Kutschera, W. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 27p. NTIS, PC A03/MF A01. Order Number DE83007863.

From 11. international radiocarbon conference; Seattle, WA, USA (20 Jun 1982).

The discussion reviews the use of accelerators originally intended for nuclear physics to do high resolution mass spectrometry for the purpose of isotope dating and age estimation of materials. (GHT)

21517 (DOE/ER/40010—965) **Calculated and measured emittance of sputter-type negative-ion source.** Billen, J.H. (Wisconsin Univ., Madison (USA)). 1981. Contract AC02-81ER40010. 4p. (CONF-821123—37). NTIS, PC A02/MF A01. Order Number DE83007298.

From 7. conference on the application of accelerators in research and industry; Denton, TX, USA (8 Nov 1982).

A method for calculating the beam current and emittance of a negative ion beam from a sputter-type source is described. Calculations are compared to measured emittance. The dependence of the emittance on ion source parameters such as cathode shape, exit aperture diameter, and cathode voltage is discussed.

21518 (GKSS—82/E/22) **Theoretical neutron spectrum of a 14 MeV neutron tube with cylindrical ion acceleration structure.** Bahal, B.M.; Fanger, H.U. (GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.). Inst. fuer Physik). 1982. 52p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE83750188.

The energy distribution of '14 MeV neutrons' at the axial sample irradiation position of a sealed neutron tube with cylindrical acceleration structure used at the GKSS facility KORONA has been calculated. The underlying physical principles and the mathematical formulation are, to some detail, described in the paper. The most propable energy of the total neutron spectrum including elastic scattering is found to be 14.60 MeV with a FWHM of 0.60 MeV. The contribution of scattered neutrons is about 29%. The effects of scattering in the sample and the influence of the neutron spectrum on the average activation cross-section are discussed for some typical cases.

21519 (LA—9572-C-Vol.1) **Proceedings of the second LAMPF II workshop.** Thiessen, H.A.; Bhatia, T.S.; Carlini, R.D.; Hintz, N. (eds.). (Los Alamos National Lab., NM (USA)). Nov 1982. Contract W-7405-ENG-36. 410p. (CONF-820745—Vol.1). NTIS, PC A18/MF A01. Order Number DE83005000.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

The second LAMPF II Workshop was held at the Los Alamos Study Center from July 19 to 22, 1982. More than two hundred scientists from more than fifty institutions participated. A broad range of physics topics was covered from nuclear chemistry to testing grand unified theories. Numerous ideas for experiments were discussed, and several proposals for new beam line technology were developed. This workshop clearly demonstrated the enthusiasm which exists for a major extension of the field of medium energy physics which would be made possible by a machine of the class of the proposed LAMPF II 16-GeV 100-μA proton synchrotron.

21520 (LA—9572-C-Vol.1, pp 12-42) **Plans for LAMPF II.** Thiessen, H.A. (Los Alamos National Lab., NM). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

A high-intensity 16- to 32-GeV proton accelerator is proposed. Several major areas of physics would benefit, including muons, neutrino physics, rare kaon decays, hypernuclei, and antiproton physics. The possibilities for constructing such a machine on the Los Alamos site and a preliminary cost estimate are discussed.

21521 (LA—9572-C-Vol.1, pp 43-57) **Kaon facility for TRIUMF.** Craddock, M.K. (TRIUMF, Vancouver, British Columbia). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

A proposal is in preparation at TRIUMF for a 10 to 15 GeV, 100 μA proton accelerator as the basis of a kaon factory to yield beams of kaons, neutrinos and other secondary particles 100 to 1000 times more intense or with much better purity than those available at present. A whole range of new measurements would become possible in both particle and nuclear physics, e.g. symmetry violations in kaon decay, neutrino scattering, meson and baryon spectroscopy, hypernuclei, exotic atoms, K^+ studies of nuclear density, and resonance propagation in nuclei. A number of specimen experimental proposals is in preparation. Two options appear to be open for the 15 GeV accelerator. One would be a 30 Hz rapid-cycling proton synchrotron with separate accumulator and stretcher rings mounted in the same 80 m radius tunnel. The other would be a two-stage isochronous ring cyclotron using 5 T superconducting dc magnets. The first stage would be a 15 sector, 10 m radius machine going to 3.5 GeV, while the second stage of 42 sectors and 41 m radius would continue to full energy. The design of kaon beams of greater purity is also under way.

21522 (LA—9572-C-Vol.1, pp 391-395) **Antiproton-nucleus physics: LAMPF II nuclear physics working group report.** DiGiacomo, N.J. (Los Alamos National Lab., NM). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

Intensive study of the interaction of low-energy (E/sub anti p/ ≦ 1 GeV) antinucleons with nuclei will commence with the inauguration of the LEAR Facility at CERN. Here we outline the physics accessible with high quality, reasonably intense (10^5 to 10^6/sec) beams of antiproton and then list the first generation of antiproton-nucleus anti pA experiments approved for LEAR.

21523 (LA—9572-C-Vol.1, pp 396-402) **Positrons and photons at LAMPF II.** Gram, P.A.M. (Los Alamos National Lab., NM). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

There is an intriguing possibility that LAMPF II could become the source of a very useful beam of monochromatic photons in addition to the meson beams which have so far been discussed. This would create the opportunity to pursue an important class of electromagnetic experiments in an energy regime that is presently inaccessible. Stopping a 16 GeV proton beam in a properly chosen combustion of low Z and high Z target materials results in combined hadronic and electromagnetic cascade whose principal end products are positrons and electrons. These emerge into a surprisingly small spatial phase space with a wide and slowly varying spectrum of energies. A 0^0 beam line could readily be built to select positrons in a narrow momentum band and conduct them to a converter where monochromatic photons would be created by annihilation in flight. The positrons themselves might also be useful but the experiments to be done with them probably require higher beam intensity than is likely soon to become available.

21524 (LA—9572-C-Vol.2) **Proceedings of the second LAMPF II workshop.** Thiessen, H.A.; Bhatia, T.S.; Carlini, R.D.; Hintz, N. (Los Alamos National Lab., NM (USA)). Nov 1982. Contract W-7405-ENG-36. 382p. (CONF-820745—Vol.2). NTIS, PC A17/MF A01. Order Number DE83005001.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

Twenty individual papers from Volume II were prepared for the data base. The major topics include the CP violation working group, the muon working group, rare decays and hyperons, neutrino physics working group, nucleon/antinucleon working group, and exotic atoms working group. In addition to these papers, the volume contains concluding remarks, and talks from the February LAMPF II workshop. (GHT)

21525 (LA—9572-C-Vol.2, pp 542-551) **Possible neutrino beams, fluxes, and rates at LAMPF II.** Wang, K.C.; Allen, R.C.; Chen, H.H. (California Univ., Irvine). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

Neutrino fluxes at LAMPF II with several different beam arrangements were calculated using numerical integration. Dependence of the flux on several parameters of the prospective neutrino facility was examined. Estimated event rates for nu/sub μ/e and nu/sub e/e elastic scattering are also given.

21526 (LA—9572-C-Vol.2, pp 609-618) **Collecting antiprotons at LAMPF II.** Mills, F.E. (Fermi National Accelerator Lab., Batavia, IL). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

Existing and planned antiproton sources at CERN and Fermilab use production targets at the limit of temperature rise, debunching to reduce momentum spread (Fermilab), precooling (longitudinal at CERN, transverse at Fermilab) to help the stochastic accumulation system, and final stochastic cooling to achieve desired final beam properties. These systems are approaching limits in accumulation rate due to the high particle number density in frequency space (bad mixing), and limits in final beam properties for the same reason and due to high spatial density because of intrabeam scattering. It seems unlikely that higher frequency systems beyond 2 to 4 GHz will lead to much better performance because of weaker coupling to the beam and propagation of wave guide modes in the vacuum chamber. Thus it seems unlikely that rates much above ~ 2 x 10^7 anti p/s will be available from these systems. The development of fast transverse stochastic precooling systems in good mixing regimes, linear debunchers to accept higher momentum spreads of antiprotons, and megavolt electron beams (for free electron lasers) open possibilities for improved rates, perhaps by a factor of ten. It will develop that there are enough antiprotons produced at 16 GeV proton energy to accomplish this, but the task would be considerably simplified with 30 GeV proton where the production cross section is apparently six times higher. The outline of such a system is described.

21527 **(LA—9643-MS) Active tuning of rf cavities.** Rickey, M.E. (Los Alamos National Lab., NM (USA)). Dec 1982. Contract W-7405-ENG-36. 10p. NTIS, PC A02/MF A01. Order Number DE83007126.

An active tuning method for rf cavities for accelerators is investigated. First tests of the method at low power levels are reported.

21528 **(LBL—15238) Low-noise wide-band amplifiers for stochastic beam cooling experiments.** Leskovar, B.; Lo, C.C. (Lawrence Berkeley Lab., CA (USA)). 5 Sep 1982. Contract AC03-76SF00098. 18p. (CONF-820997—2). NTIS, PC A02/MF A01. Order Number DE83007043.

From Workshop on beam cooling; Stoughton, WI, USA (9 Sep 1982).

Noise characteristics of the continuous-wave wide-band amplifier systems for stochastic beam cooling experiments are presented. Also, the noise performance, bandwidth capability and gain stability of components used in these amplifiers are summarized and compared in the 100 MHz to 40 GHz frequency range. This includes bipolar and field-effect transistors, parametric amplifier, Schottky diode mixer and maser. Measurements of the noise characteristics and scattering parameters of variety GaAs FETs as a function of ambient temperature are also given. Performance data and design information are presented on a broadband 150-500 MHz preamplifier having noise temperature of approximately 35°K at ambient temperature of 20°K. An analysis of preamplifier stability based on scattering parameters concept is included.

21529 **(PB—82-226895) Terminal pumping using a turbomolecular pump as a recirculating gas compressor.** McK.Hyder, H.R. (Oxford Univ. (UK). Nuclear Physics Lab.). 1982. 16p. NTIS, PC A02/MF A01.

Tests were carried out to confirm the suitability of the Turbovac 150 as a terminal pump in tandem accelerators and to find out if it can be powered directly from a 400 Hz power supply.

21530 **Determination of transverse shielding for proton accelerators using the Moyer Model.** Stevenson, G.R. (European Organization for Nuclear Research, Geneva (Switzerland)); Kuei-Lin, L. (Academia Sinica, Beijing (China). Inst. of High Energy Physics); Thomas, R.H. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.; California Univ., Berkeley (USA). School of Public Health). *Health Physics;* 43: No. 1, 13-29(Jul 1982).

The historical development of the Moyer Model-an empirical method used in the design of high energy proton accelerator shielding-is described. With the improvements in the understanding of high-energy radiation phenomena which have occurred during the past 20yr it is now possible to lay a more satisfactory theoretical basis for this model. Several measurements at various high energy proton accelerators now make it possible to improve the parameters used in the model and consequently to increase its accuracy. An example of the use of the model to calculate transverse shielding for an extended uniform line source is given and comparison made with calculations by O'Brien.

21531 **(CAPE—2788) SLAC positron-source station Mark II (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). 1982. Contract AC03-76SF00515. K. Order Number DE83005719.

The drawing list DL 900-838-00-R1 and the listed drawings therefrom provide partial information for construction and installation of the SLCA positron Source Assembly. The drawings listed are primarily concerned with the magnets and their supports. Other details and drawings on the drawing list, not supplied here, do provide the remaining details for construction of the complete assembly as used at SLAC. The complete positron source provides positrons and electrons when the target is bombarded by energetic electrons. Positrons are separated from the electrons by means of an rf separator and a magnet system and further accelerated to the desired energy along the remaining two-thirds of the accelerator. The drawing list and the listed drawings on Drawing List DL 900-840-00-R0 provide patial construction information for the Tapered Field Solenoid (TFS) which is part of the longer Positron Source System at SLAC. Complete details are contained in the remaining drawings, not supplied for the TFS.

21532 **(CAPE—2790) RF particle separator for the SLAC linear accelerator's positron source (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). 1982. Contract AC03-76SF00515. K. Order Number DE83005721.

The drawing list and listed drawings comprise the necessary drawings and specifications to construct the 24-inch-long rf particle separator used to help separate electrons from positrons emanating from the SLAC positron source target/radiator. Input power used at SLAC is typically 1.5 MW peak and at a frequency of 2856 MHz. Operating mode is HEM_{11}. At 1.5 MW peak input power the deflection on either electrons or positrons is approximately 0.5 MeV/c.

21533 **(CAPE—2801) Profile monitor (at Accelerator Sections 28-9 and 29-9) (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). 1982. Contract AC03-76SF00515. K. Order Number DE83005685.

The Drawings listed on drawing list DL 900-411-42 provide the construction and installation data for the profile monitors used at the drift sections 28-9 and 29-9 on the SLAC Two-Mile Linear Accelerator. These devices when properly activated insert a fluorescent screen into the beam line which glows in the area of electron or positron bombardment. Use of remote television cameras or other viewing devices allows the operator to position and/or shape the beam by adjusting the appropriate linac controls.

21534 **(CAPE—2873) PEP beam-position monitor system (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). 1981. Contract AC03-76SF00515. K. Order Number DE83005679.

The drawings under this series provide construction and installation information about the various components of the PEP Storage Ring's Beam Position Monitoring System. The complete system provides electronic signals for data taking, visual presentation, computer control and other general operational functions. The devices range from beam-line cavity or pickup devices thru the cabling and display devices.

21535 **Hollow cathode and ion accelerator system for current ion sources.** Aston, G. (JPL, Pasadena, CA, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1498-1501(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

A small self-heating hollow cathode has been designed and tested which uses a novel flowing plasma starting concept to eliminate the need for cathode heating elements and low work function insert materials. In a magnetic field free ion source, this cathode has reliably and repeatedly produced arc currents, using argon, of 100 ampere (the power supply limit) at arc voltages of 22 volts. The cathode operates with a high gas stagnation pressure and plasma density to produce field enhanced thermionic emission from the electron emitting surface, a 0.02mm thick rolled tungsten foil cylinder, without appreciable erosion of this surface. Possible applications of larger versions of this hollow cathode for use in neutral beam injector ion sources are discussed. An ion accelerator system has also been designed and tested which combines a unique arrangement of multiple hole and slit apertures to amplify the extracted ion current density by a factor of four during the ion acceleration process.

21536 Radiation lifetimes and failure mechanisms of carbon stripper foils. Auble, R.L. pp 158-162 of Proceedings of the third international conference on electrostatic accelerator technology. Oak Ridge, TN; Oak Ridge National Laboratory (1981). Contract W-7405-ENG-26.

Measurements of lifetimes of thin carbon foils under heavy-ion irradiation are compiled and recent advances in stripper foil technology are reviewed. The impact of recent foil lifetime improvements, many by more than an order of magnitude, on heavy-ion electrostatic accelerators is discussed. Foil inhomogeneities, particularly those caused by sputtering are suggested to be a prime factor in usable foil lifetimes.

21537 (CAPE—2768) SLAC 38 MW pulsed Klystron, Model XK-5 (Engineering Materials). (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83005732.

Assembly drawing AD-704-011-00 provides the overall assembly drawing with references to subsequent subassembly and fabrication drawings and defines and provides the information for constructing a SLAC 40MW pulsed Klystron model XK-5. Nominal specifications are: power out-38 MW; pulse width-2.5 μs; and beam voltage-270 kV.

21538 (CAPE—2759) Electron gun SLAC Model 5-3 (Engineering Materials). (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83005767.

The drawings on DL 790-150-00 provide the data and specifications for constructing the model 5-3 electron gun as used on the Stanford Linear Accelerator Center's two-mile linear accelerator. This gun was developed to give short pulse lengths of electrons for use with the SPEAR and PEP storage rings. It is also suitable for regular beams that use currents of 2 μs lengths. The gun is a triode which allows pulse lengths to be varied as a function of grid voltage. The basic specifications of the gun are: 2A max at 80 kV; 360 pps max (design); pulse lengths from 1 ns to 2 μs; grid cutoff voltage -40 vdc; and max current grid voltage +150 vdc.

21539 (CAPE—2758) Subharmonic buncher section (SLC) (Engineering Materials). (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83005766.

Drawing list DL 795-645-00 and the drawings thereon provide the data and specification for construction of a special subharmonic buncher section to provide pre-bunching for the Stanford Linear Accelerator Center's linear collider project's injector system. The buncher (2 in tandem) takes 3 ns bunches and reduces the bunch length to that of 1 cycle at 2856 MHz, the accelerator's accelerating rf frequency. The buncher frequency is 178.5 MHz at approximately 10 kW in each section for acceptable bunching.

21540 (CAPE—2756) 7-foot accelerator section (Engineering Materials). (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83005768.

9 35 MM aperture cards.

The included drawings plus the drawings on DL 750-207-00-RO (3 pages) 10 Foot Accelerator, final Body Braze, Sectors 2-30 provide the data and specifications for constructing a 7 foot long Stanford Linear Accelerator Center type of accelerator section. The units were used on the SLAC Two Mile Accelerator where a 10 foot section would not fit because other beam line devices needed the space.

21541 (CAPE—2754) Bunch monitor-standard drift section (Engineering Materials). (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83005777.

Drawing list DL-795-615-00 provides the drawings, data and specifications for constructing a bunch monitor used on the Stanford Linear Accelerator Center Two-Mile linear accelerator. The device is used to monitor the amplitude of the bunches as they traverse the monitor cavity. The assembly contains a 2856 MHz cavity, a 24280 MHz cavity, and a current toroid. The current toroid was included because of space considerations. The 2856 and the fifth harmonic cavities were originally designed to provide bunch length, however, maximizing the fifth harmonic on an oscilloscope with maximum gain and the zero depressed gives adequate sensitivity for detecting best bunching of the electrons.

21542 (CAPE—2753) Lens: two-gun injector (Engineering Materials). (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83005772.

The assembly drawing and the drawings called out on it and subsequent drawings provide the data and specifications for constructing the magnetic thin lens used on the SLAC two-mile linear accelerator's injector system which has two electron guns installed. The lens allows the focusing of the electron beam as it is emitted from its related gun. There are six of these lenses spaced to allow appropriate focusing of the electron bunches/beam after it leaves its gun and proceeds down the beam pipe and subsequently enters the injector accelerator section.

21543 (CAPE—2750) Layout, SLAC accelerator injector system (Engineering Materials). (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83005771.

8 35 MM aperture cards.

The listed drawings provide a combination layout, schematic and some detail of the Stanford Linear Accelerator Center's Injector for the two-mile linear accelerator. These drawings as a group do not supply all the details but are intended to provide insight for discussion and possibly for some engineering design.

21544 (CAPE—2748) SLAC high-current electron gun (Engineering Materials). (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83005769.

8 35 MM aperture cards.

The high current electron gun described by drawing AD-795-648-00 R1E gives up to 12 amperes of pulsed current when the proper voltages are applied. The following are the maximum design specifications: 12 A pk, 200 kV, 2 μs pulse width, and 180 pps. Tests have only verified operation at 160 kV, 60 pps, 5 ns pulse width, and 6A pk.

21545 (CAPE—2749) SLAC Accelerator Section-Injector (Engineering Materials). (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83005770.

The main drawing lists the drawings needed for constructing the Stanford Two Mile Linear Accelerator's Injector section assembly. The system consists of a standard 3 metre accelerator section plus a nu/sub p/ = 0.75 c buncher section. It is mounted in a stainless steel tube which supports the solenoid focusing coils. The system is designed to accept 0.5 c prebunched electrons and accelerate them to very nearly the velocity of light (≈ 0.999 c). The electrons are bunched into ~ 5^0 at 2856 MJHz.

21546 (CAPE—2808) Selected PEP vacuum components (Engineering Materials). (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83008121.

The drawings listed provide the information for construction of the listed titles of the SLAC PEP vacuum systems (window assembly-vacuum chamber septum, vacuum chamber septum, and vacuum fault module). The septum vacuum chamber is used in the electron and positron ring injection magnets. The vacuum fault modules are part of the overall electronic-vacuum system.

21547 **(CAPE—2809) Vacuum system electronics for main injector fast valve control and beam shut off: system schematic SS 101-010-00 (2 shts) (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83007292.

The drawings listed provide the electronic schematic of the electronic system used to control the Fast Valve Controller and beam shut off system for the injector area of the SLAC Two-Mile Linear Accelerator. Vacuum sensors detect a rising pressure and the Fast Valve Controller reacts by closing the appropriate beam line fast valves to isolate the high vacuum of the rest of the Accelerator from the area of higher pressure. Concurrently the Tone Control Loop activates the devices that deactive the electron gun and thereby shuts the beam off so that the valves are not damaged.

21548 **(CAPE—2807) Selected SLAC vacuum control units (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83008122.

The listed drawings provide the construction information for the SLAC devices listed (PLS mag vacuum intlk, VGC discriminator and drivers, API meter vac gauge controller, and vacuum gauge control pnl). These are parts of the overall Linear Accelerator's vacuum electronic control system. The main item described is the Vacuum Gauge Controller.

21549 **(CAPE—2715) Electron gun SLAC model 5-3 (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83008118.

The drawings on DL 790-150-00 provide the data and specifications for constructing the model 5-3 electron gun as used on the Stanford Linear Accelerator Center's two-mile linear accelerator. This gun was developed to give short pulse lengths of electrons for use with the SPEAR and PEP storage rings. It is also suitable for regular beams that use currents of 2 μs lengths. The gun is a triode which allows pulse lengths to be varied as a function of grid voltage. The basic specifications of the gun are: 2A max at 80 kV, 360 pps max (design), pulse lengths from 1 ns to 2 μs, grid cutoff voltage -40 vdc, and max current grid voltage +150 vdc.

21550 **(CAPE—2691) Alpha magnet assembly (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83008117.

The listed drawings provide manufacturing information necessary to construct a magnet used to inject electrons or other charged particles into a linear-type accelerator from a non-inline source. A moderate amount of focusing is provided by the fringe fields of the magnet. The magnet can be pulsed at frequencies up to 360 pps. With proper beam line magnetic compensation several injector Alpha magnets can be used in series in the main beam line.

21551 **(CAPE—2806) SLAC hybrid power divider (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83006823.

The listed drawings provide the construction information for one of the waveguide power dividers used on the SLAC linear accelerator. These drawings define the power divider used in the accelerator housing to divide the power from the Klystron and direct it to the inputs of 2 of the 4 accelerator sections on a 40 foot girder assembly. The central divider portion is used in a similar power divider used in the Klystron Gallery to divide the Klystron power by 2. Drawing SA767-306-03-R5 is a representative sub-assembly that defines one specific use at SLAC of the Hybrid power splitter.

4304 Storage Rings

REFER ALSO TO CITATION(S) 21507, 21614, 22273, 22301

21552 (CONF-8010206—Vol.1, pp 32-56) **Fermilab antiproton-proton collider and source.** Cline, D.B. (Wisconsin Univ., Madison (USA)). 1981. Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

Present status of the development of the Fermilab antiproton-proton collider and source intended for searching the intermediate vector bosons is described. The expected luminosity to be reached is 10^{30} cm^{-2} s^{-1}. The Fermilab scheme uses two storage rings and a cycle of beam deceleration and both stochastic cooling (precooling) and electron cooling at the lower energy. Layout of precooling system is shown. The number of rf accelerating cavities of the tevatron storage ring will be increased from three to six. Four of the cavities will be dedicated to protons and two to antiprotons. The forward spectrometer consisting of a dipole spectrometer, a Cherenkov ring imaging system, a transition radiation detectors, an electromagnetic shower calorimeter, and a hadron calorimeter is presented.

21553 (CONF-8010206—Vol.1, pp 259-265) **Proton-antiproton colliding beam electron cooling.** Derbenev, Ya.S.; Skrinskij, A.N. (AN SSSR, Novosibirsk. Inst. Yadernoj Fiziki)). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

A possibility of effective cooling of high-energy p anti p beams ($E=10^2$-10^3 GeV) in the colliding mode by accompanying radiationally cooled electron beam circulating in an adjacent storage ring is studied. The cooling rate restrictions by the p anti p beam interaction effects while colliding and the beam self-heating effect due to multiple internal scattering are considered. Some techniques permitting to avoid self-heating of a cooling electron beam or suppress its harmful effect on a heavy particle beam cooling are proposed. According to the estimations the cooling time of 10^2-10^3 s order can be attained.

21554 (CONF-8010206—Vol.1, pp 266-268) **Study on the compensation of electron beam space charge in facilittes with electron cooling.** Dikanskij, N.S.; Kudelajnen, V.I.; Parkhomchuk, V.V.; Pestrikov, D.V. (AN SSSR, Novosibirsk. Inst. Yadernoj Fiziki)). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

The results of experimental investigations of a compensated electron beam on the NAP-M facility are presented. The electron beam is compensated by electrostatic plugs preventing ion leakage along the beam. Cut-off electrodes have the shape of cutted cylinders encircling the electron beam. To eliminate electron accumulation around the plugs one of the electrodes has a zero potential, which results in formation of an transverse electric field causing ionization electron drift in the transverse direction to the electric and magnetic fields. The effect of wave damping, in the compensated beam is observed, that demonstrates the possibility of gaining great current densities in long compensated beams necessary for antiproton storage. For the NAP-M at the 10^{10} cm/s electron velocity, 300 cm length of ion column, and 1 kOe field intensity the threshold beam current density is 0.96 A/cm^2.

21555 (CONF-8010206—Vol.1, pp 288-292) **Different type modulation effect on decreasing the stochasticity threshould in beam-beam interaction.** Vasserman, I.B.; Izrajlev, F.M. (AN SSSR, Novosibirsk. Inst. Yadernoj Fiziki)). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

Comparative investigations of different types of modulation and their combined effect on decreasing the stochasticity threshold in colliding beam installations are considered. The interaction of a single particle with a field of an infinitely short colliding beam is studied in the one-dimensional approximation. The betatron phase modulation and external perturbation amplitude modulation are considered. It is shown that overlapping of nonlinear resonances for the lack of modulation is a cause of stochastic instability. The dependence of the threshold value of the critical current density on the modulation amplitude is given. It is also shown that the phase modulation leads to formation of side resonances near every main resonance, where each of the side resonances is splitting that facilitates overlapping of all the subsidiary resonances.

21556 (CONF-8010206—Vol.1, pp 302-305) **VLEPP conversion system for polarized beam production.** Balakin, V.E.; Mikhajlichenko, A.A. (AN SSSR, Novosibirsk. Inst. Yadernoj Fiziki)). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

The solution of the beam conversion problem for energies of several hundred GeV with production of polarized positrons and electrons is proposed for the first time. The essence of the method consists in irradiating a thin target by a beam of circularly polarized high-energy photons, which, in turn, are produced when the beam passes through initial particles through a helical ondulator. Interaction of photons with the target results in production of electron-positron pair and the Compton electrons, which appear to be polarized in the direction of photon polarization at the upper boundary of energy spectrum. Then the produced positrons and electrons are reaccelerated and injected into the storate ring, where the beam is cooled due to synchrotron radiation. Some conversion circuit is considered and approximate characteristics of the system for the electron-positron beam collider are presented.

21557 (CONF-8010206—Vol.1, pp 13-22) **IHEP accelerating-storage facility (present status).** Ageev, A.I.; Balbekov, V.I.; Gridasov, V.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1981. (In Russian). Joint Inst. for Nuclear Research, Dubna, USSR.

From 7. all-union national conference on particle accelerators; Dubna, USSR (14 Oct 1980).

The status of development of separate systems of the IHEP accelerating-storage facility (ASF) is described. Several superconducting dipole models of 1 m length are constructed and studied. A trapezoidal transposed cable of 23 wires, each 0.85 mm in diameter, containing 1045 NbTi filaments of 17 μm thickness, is used as a current-carrying element of the model windings. During immerison tests a>5 T field is attained. To find out the possibility of creating 10^{-9} Torr vacuum in the chamber of the ASF first stage the dependence of the gassing rate and composition of residual gas on the chamber surface treatment technology is studied. The conceptual design of the cryogenic supply system consisting of six helium liquefiers, each of 1000 l/h capacity, 24 satellite refrigerators of 2100 W power at 4K and 4600 W power at 80 K, is completed. For helium compression 40 helical compressors at 500 kg/h capacity will be used. The ASF accelerating resonators are studied on rigs. Investigations on optimization of the beam injection and extraction systems are being conducted at present. To reduce irradiation provision is made for placing steel collimators of the 6 m length in front of the superconducting magnetic system. It is expected to ensure slow beam extraction at the 3 TeV energy with the 10^{14} proton/cycle and fast beam extraction with the 10^{13} proton/pulse.

21558 (DOE/SF/00515—T4) **PEP storage ring magnets and power supply system.** (Stanford Linear Accelerator Center, CA (USA)). 1982. Contract AC03-76SF00515. 97p. NTIS, PC A05/MF A01. Order Number DE82014964.

Operating and service instructions are given for the PEP storage ring magnet power supplies. Reference CAPE-2747. (GHT)

21559 (LA-UR—83-299) **New method for inverting the closed-orbit distortion problem.** Warren, J.L.; Channell, P.J. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 4p. (CONF-830311—3). NTIS, PC A02/MF A01. Order Number DE83007540.

From Particle accelerator conference; Santa Fe, NM, USA (21 Mar 1983).

A certain class of magnet misalignments in storage rings and other accelerators produces closed-orbit distortions (CODs). Quite often the CODs are measured at a fewer number of locations (N) than the number of misalignment parameters (M). There is a linear relation between COD measurements, u(j), j=1, ..., N and the misalignment parameters e(k), k=1, ..., M. Hence the e(k)'s are underdetermined. If M < 2N, one can obtain an overdetermined set of equations by measuring the COD at two quadrupole settings. There are several ways of inverting the COD measurements to get the misalignment parameters that are fairly insensitive to errors in the measured CODs. A comptuer program called CODINV has been written to test some of these schemes. Two schemes give fairly good results when applied to the lattice of the Los Alamos Proton Storage Ring (PSR). The first scheme requires measurements at two nearby tunes and the use of singular-value decomposition methods. The second scheme requires measurements of the CODs in the FODO and DOFO cell arrangements but is easier mathematically.

21560 (SLAC-PUB—3022) **Storage ring design optimization for FEL operation.** Wiedemann, H. (Stanford Linear Accelerator Center, CA (USA)). Nov 1982. Contract AC03-76SF00515. 9p. (CONF-820988—6). NTIS, PC A02/MF A01. Order Number DE83007060.

From Free electron laser conference; Bendor, France (26 Sep 1982).

An electron beam in a storage ring seems to be a perfect driver for a free electron laser. The understanding of storage rings is very well advanced to project designs with high peak current, small beam sizes and short damping times. Since the beam is recycled after passage through the optical cavity we can expect a relatively high overall efficiency. On the other hand, however the fact that we do want the beam to circulate and interact with the laser field every turn puts a limit on the allowable perturbation of the beam due to the laser field. This limits the peak laser power we can get from a storage ring beam. The main advantage of a storage ring for FEL operation therefore is realized for continuous high power laser generation. In this paper we discuss some of the limitations in storage ring beam parameter as they pertain to FEL operation. The interaction of a FEL field with the beam, however, is not discussed here.

21561 (CAPE—2791) **SHAM: Liquid Argon Sample and Hold Module (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). 1981. Contract AC03-76SF00515. K. Order Number DE83005722.

9 35 MM aperture cards.

The drawings listed on Drawing List DL-135-347-00 provide the data and specifications to construct the SHAM Liquid Argon Sample and Hold Module used on the Liquid Argon Shower Counters of the Mark II Detector at SPEAR. The module accepts shaped bipolar pulses of 600 ns rise time (0 to 100%). It contains 32 channels with 0 to +5 volts, transformer coupled input and 0 to +5 volts from 120 ohms. Physical size is a single width CAMAC module.

21562 (CAPE—2762) **PEP r-f accelerating cavities (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83005775.

The listed drawings and those listed on the drawings provide the data for construction of the r-f acceleration cavity sections used on the Stanford Linear Accelerator Center (SLAC) PEP storage ring. These cavities provide the make-up energy lost through synchrotron radiation for the circulating positron and electron beams. These cavities at PEP are driven by CW Klystrons.

21563 (CAPE—2752) **PEP r-f low-level system (phase lock, gap voltage, and frequency control) (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83005776.

8 35 MM aperture cards.

The listed drawings and subsequent referenced drawings therein provide the data and specifications for construction of the phase lock, gap voltage, and frequency control systems used to control the rf accelerating cavity parameters of the Stanford Linear Accelerator Center's PEP storage ring. The phase lock portion is a phase locking system which maintains a constant phase relationship of the cavity phase to the drive (reference) phase by controlling an rf phase shifter. The gap voltage loop maintains a constant accelerating field at the gap in the cavity. The frequency control-tuning loop provides the means for keeping the cavity tuned to the ring's rf frequency by adjusting the cavity's mechanical tuner.

21564 **(CAPE—2751) 50-MHz SPEAR r-f cavities (out of use since 1976) (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83005773.

6 35 MM aperture cards.

Drawing SA-443-001-05 and subsequently referenced drawings therein provide the data and specifications for constructing a 50 MHz rf accelerating cavity used on the Stanford Linear Accelerator Center's SPEAR storage ring up to 1976. These cavities provided the make-up energy lost through synchrotron radiation of the circulating positron and electron beams: until they were replaced with more efficient cavities designed for 356 MHz rf.

44 INSTRUMENTATION

21565 **(ORNL—5931-Vol.1) Instrumentation and Controls Division progress report, September 1, 1980-July 1, 1982.** Klobe, L.E.E. (ed.). (Oak Ridge National Lab., TN (USA)). Dec 1982. Contract W-7405-ENG-26. 207p. NTIS, PC A10/MF A01. Order Number DE83007174.

Activities are reported by the Reactor Systems Section, Research Instrument Section, and the Measurement and Controls Engineering Section. Reactor system activities include dynamic analysis, survillanc and diagnostic methods, design and evaluation, detectors, facilities support, process instrumentation development, and special assignments. Activities in the Research Instrument Section include the Navy-ORNL RADIAC development program, advanced γ and x ray detector systems, neutron detection and subcriticality measurements, circuit development, position-sensitive detectors, stand-alone computers, environmental monitoring-detectors and systems, plant security, engineering support for fusion energy division, engineering support for accelerator physics, and communications: radio, closed-circuit tv, and computer. Activities in the Measurement and Controls Engineering Section include the AVLIS program; gas centrifuge enrichment technology support; Advanced Instrumentation for Reflood Studies (AIDRS) program; instrumentation development support for fuel reprocessing; in-core experiments and reactor systems; energy, conservation, and electric power systems; computer systems; measurements research; and fossil energy studies Publications are listed. (WHK)

GASPAN must be aligned with the particular detector system it uses. It will accept data for up to 1024 channels.

GASPAN analyzes output pulses from a lithium-drifted germanium semiconductor detector to define complex gamma-ray spectra of routine crud and filtrate samples.CDC6600; FORTRAN IV; SCOPE; CDC6600 and CalComp plotter.

21567 **(ANL/NESC—902) QLN1; quantitative gamma-ray spectra analysis.** Yule, H.P. (NUS Corp., Gaithersburg, MD (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048902.

Maximum of - 100 peaks per spectrum.

QLN1 identifies gamma-ray emitters contributing to Ge(Li) detector spectra, and computes quantitative amounts of isotopes contributing to the data.UNIVAC1108,1100; FORTRAN V; EXEC8; The LISTER program requires 35,000 words of memory and 5 direct-access devices (logical units 10, 14, 28, 29, and 31) for execution. QLN1 requires 47,000 words of memory and 5 direct-access devices (logical units 14, 20, 21, 22, and 23) for execution.

21568 **(CONF-811012—65) Optimization of a Hornyak-button detector for fast-neutron detection.** Fink, C.L. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01. Order Number DE83007653.

From IEEE symposium on nuclear science; San Francisco, CA, USA (21 Oct 1981).

As part of an ongoing program to improve the fuel-motion capability of the fast-neutron hodoscope, a response model has been developed for the Hornyak-button detector. The model provides a description of the efficiency and gamma sensitivity of a Hornyak button in terms of detector parameters such as scintillator concentration, grain size, length, and transparency. It is possible using this model to quantitatively choose detector parameters for the Hornyak button.

21569 **(CONF-811012—66) Cathode uniformity of new square photomultiplier tubes.** Brenner, R.; Chou, H.P.; Strauss, M.G.; Winiecki, A.L. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 6p. NTIS, PC A02/MF A01. Order Number DE83007686.

From IEEE symposium on nuclear science; San Francisco, CA, USA (21 Oct 1981).

Square photomultiplier tubes (PMTs) should have better light collection than round PMTs when used in square or rectangular Anger-type γ-ray or neutron position detectors. Photocathode response uniformity of new RCA square PMTs type S83003E (51.5 x 51.5 mm^2) was measured and compared with conventional round PMTs. The PMTs were scanned with a small scintillation source while the anode signal amplitudes were processed in a computer-based multichannel analyzer. The analyzer was programmed in a mode which virtually eliminates effects due to statistical fluctuations in source rate and output amplitude. Pulse heights as a function of source position on the PMT face are shown for typical tubes. The response uniformity of 64 square PMTs and 21 round ones was evaluated. It is shown that the center region of the square PMTs is as uniform as that of the round ones and that the response in the corners is comparable to that in the center. Thus square PMTs appear to have an advantage for use in square or rectangular position detectors.

21570 **(CONF-820667—8) Introduction to fifth international workshop on mercuric iodide nuclear radiation detectors.** Schieber, M. (Hebrew Univ., Jerusalem (Israel); EG and G, Inc., Goleta, CA (USA)). 1982. Contract AC08-83NV10282. 6p. NTIS, PC A02/MF A01. Order Number DE83006571.

From 5. international workshop on HgI/sub 2/ nuclear radiation detectors; Jerusalem, Israel (6 Jun 1982).

Mercuric iodide is a wide bandgap semiconductor, with Eg ≈ 2.14 eV at room temperature. Therefore, HgI_2 is totally different from the well-studied, narrower gap, elemental semiconductors such as Si and Ge, and also different in its physical and chemical properties from the known semiconductor binary zinc-blend compounds such as GaAs or InP. The purpose of studies in the last decade was to further our understanding of HgI_2; recent progress is reported. (WHK)

21571 **(CONF-8206118—10) Tests of a resonance detector spectrometer for electron-volt spectroscopy.** Carpenter, J.M.; Watanabe, N.; Ikeda, S.; Masuda, Y.; Sato, S. (National Lab. for High Energy Physics, Oho, Ibaraki (Japan)). 1982. Contract W-31-109-ENG-38. 13p. NTIS, PC A02/MF A01. Order Number DE83007611.

From 6. annual international collaboration of advanced neutron sources meeting; Argonne, IL, USA (28 Jun 1982).

We have tested a resonance detector spectrometer at the KENS neutron source, using ^{181}Ta, ^{121}Sb and ^{149}Sm absorbers and bismuth germanate (BGO), NaI and plastic scintillators. In the process we uncovered and solved numerous background problems, and discovered a time-focussing principle. We measured the scattering from a number of materials and so far have analyzed and present results for bismuth and graphite. Tests of cooled absorbers have indicated that resolution of 70 MeV is possible with ^{181}Ta.

21572 (DOE/NV/10282—T1) **Review of mercuric iodide development program in Santa Barbara.** Lamonds, H.A. (EG and G, Inc., Goleta, CA (USA)). 1982. Contract AC08-83NV10282. 16p. NTIS, PC A02/MF A01. Order Number DE83007412.

Crystal growth and device fabrication methods used at EG and G Santa Barbara are reviewed. The chemical and structural characterization of the grown crystals and the different types of detectors and their areas of application are also briefly described. The experimental results presented, especially with respect to the spectral response of detectors with thicknesses of 1 cm or more, indicate the large potential of mercuric iodide as a material for future detector applications.

21573 (FERMILAB/TM—1155) **Design of the magnetized muon shield for the prompt-neutrino facility.** Baltay, C.; Bosek, N.; Couch, J. (Fermi National Accelerator Lab., Batavia, IL (USA)). 12 Oct 1982. Contract AC02-76CH03000. 135p. NTIS, PC A07/MF A01. Order Number DE83007872.

The main technical challenge in the design of the prompt neutrino beam is the magnetized muon shield. Two satisfactory alternate designs have been developed for such a shield during this past year and the background muon fluxes have been calculated by three independent programs at Columbia, Fermilab, and MIT. The background muon fluxes have been calculated to be satisfactory in all of the detectors that might use the beam. In Section III of this report we describe in detail the three Monte Carlo programs used in these calculations. In Section IV we give the details of the flux calculations for the E-613 shield and the comparisons with the observed fluxes with various configurations of that shield. In Section V we describe the designs that have been developed for the neutrino area shield. In Section VI we discuss the problem of proton beam transport losses and the associated muon fluxes. Finally, in Section VII a comparison of the two solutions is made which covers cost, effectiveness, schedule and responsiveness to future unknowns. We conclude that there are not overwhelming reasons for the choice of one design over the other. However, for a variety of secondary reasons the superconducting design offers advantages. We therefore propose the construction of the prompt neutrino facility with the superconducting magnet design.

21574 (FOA-C—40138-A3) **Control of the intensimeter RA 73 used in Switzerland.** Ulvs, T.; Hulten, G. (Research Inst. of National Defence, Umea (Sweden)). Aug 1981. 14p. (In Swedish). NTIS, PC A02/MF A01.

The intensimeter used by the Swiss and French military, the 'Control and Alarm Radiation Meter, model RA 73' was tested for accuracy under various conditions. The intensimeter has a very low energy and exposure rate dependency. The effect of humidity and temperature variation is low (less than 10 percent) while the directional dependency for low energy levels is great. The instrument has an estimated degree of error of less than + or - 20 percent. The intensimeter is small and easy to carry. Measurements are read on a logarithmic gauge which covers the instruments two ranges, 1mRh to 1000mRh. The intensimeter has two GM tubes, one for high, one for low activity.

21575 (HMI-B—246) **CAMAC instrumentation for monitoring and control of the VICKSI accelertaors - description of the CAMAC and auxiliary equipment.** Busse, W.; Kluge, H.; Bosch, A.; Herdam, G.; Klessmann, H.; Martini, M.; Wawer, W. (Hahn-Meitner-Institut fuer Kernforschung Berlin G.m.b.H. (Germany, F.R.)). Dec 1977. 209p. (In German and English). NTIS (US Sales Only), PC A11/MF A01. Order Number DE83900906.

Descriptions are given for CAMAC system units, modules for interfacing peripheral devices, test equipment, and special peripherals and auxiliary equipment. (GHT)

21576 (INFN/TC—82/9) **Triple majority coincidence with four inputs.** Castoldi, M. (Istituto Nazionale di Fisica Nucleare, Genoa (Italy)). 16 Jun 1982. 6p. (In Italian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE83900839.

A description is given for a variable majority coincidence module and circuitry design for use at the Genoa section of the Italian National Nuclear Physics Institute. 3 figures.

21577 (INW—8104) **A particle spectrometer with a large geometric factor for the energy range 0.1 to 30 keV.** Urban, A. (Graz Univ. (Austria)). Apr 1981. 22p. NTIS, PC A02/MF A01.

The design and the calibration of a detector using a channel electron multiplier (CEM) together with a spherical electrostatic analyzer are described. The CEM characteristic equivalent energy band widths, opening angles, and sensitive areas are defined and are given as functions of energies between 0.1 to 25 keV. The analyzer deflection high voltage, the CEM acceleration high voltage, the measurement control unit and the data processing interfaces are described. The numerical analysis of the geometric factor from the calibration data is demonstrated. Energy and pitch angle distribution of energetic electrons were measured. The 90 deg sensor detects a constant energy spectrum over the entire period, while the 30 deg sensor exhibits large variations. Changes in trapped particle pitch angle distribution (from isotropic at 154 to 156 sec flight time to anisotropic above 157 sec at the lowest and highest energies) explains the variations. (ESA)

21578 (LA—9572-C-Vol.2, pp 593-601) **Liquid time projection chamber.** Mahler, H.J.; Doe, P.J.; Chen, H.H. (California Univ., Irvine). Nov 1982. NTIS, PC A17/MF A01. Contract AM03-76SF00010.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

The liquid time projection chamber (TPC), like its gas counterpart, allows three-dimensional imaging of charged particle trajectories by drifting the ionization electron trails in a homogeneous electric field into a readout plane where the arriving charge is amplified and digitized as a function of time. Segmentation of this readout plane provides two transverse coordinates, while the the drift time provides the third coordinate parallel to the electric field. This principle is shown in the case of our two-dimensional liquid argon TPC. The collected charge provides energy and/or dE/dX information, and many of the TPC liquids are also excellent scintillators. Since the liquid TPC is totally sensitive and it can be very massive, it may be an ideal detector for experiments searching for rare decays, e.g. nucleon decay, $\beta\beta$-decay, etc., or in neutrino experiments at accelerators, meson factories, reactors, as well as with solar or cosmic ray neutrinos. In these cases, the detector medium is either the source or the target of the investigated process.

21579 (LA-UR—83-290) **Los Alamos portable beta-ray spectrometer.** Erkkila, B.H.; Brake, R.J.; Waechter, D.A. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 8p. (CONF-830204—4). NTIS, PC A02/MF A01. Order Number DE83007575.

From International beta dosimetry symposium; Washington, DC, USA (15 Feb 1983).

The integration of a beta-ray detector to multichannel analyzer (MCA) and computer has resulted in a portable spectrometer for studying beta rays in the field. The present detector is a 5 cm diameter by 2 cm thick plastic scintillator manufactured by Bicron, Inc. Other detectors can easily be integrated into the package. The integral instrument package is 15 cm wide by 15 cm high by 25 cm long and weighs less than 10 pounds. Internal rechargeable batteries for 8 hours of field operation are included. The instrument contains a detector, an amplifier, a multichannel analyzer, and a liquid crystal display (LCD). A microprocessor controls all the functions of the instrument and is programmed to display all necessary information and 128-channel spectra on the LCD.

21580 **(LA-UR—83-424) BGO in several satellite-borne applications.** Klebesadel, R.W. (Los Alamos National Lab., NM (USA)). 1982. Contract W-7405-ENG-36. 19p. (CONF-821160—2). NTIS, PC A02/MF A01. Order Number DE83007560.

From International workshop on bismuth germanate; Princeton, NJ, USA (10 Nov 1982).

An experiment is being prepared to be flown on a NASA/NOAA TIROS satellite. Named DOEE-1 (Department of Energy Experiment), it will carry a segmented 2.7" x 3" BGO (Bismuth Germanate) scintillator. Sufficient telemetry will be provided to evaluate the performance exhaustively during a long exposure in space. Another instrument including a BGO scintillator, named SEE (Spectrometer for Energetic Electrons), has been operating at synchronous altitude since 1979, providing measurements of electron fluxes at $2.5 \leqq E \leqq 9$ MeV. Unfortunately, the data are not suitable for a critical evaluation of the BGO scintillator performance, since scintillator response is not directly monitored.

21581 **(N—82-26068) An imaging gas scintillation proportional counter for the detection of subkiloelectron-volt x-rays.** Hailey, C.J.; Ku, W.H.M.; Vartanian, M.H. (Columbia Univ., New York (USA)). Nov 1981. 18p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 301-318 (SEE N82-26055 16-88) REFS.

A large area imaging gas scintillation proportional counter (IGSPC) was constructed for use in X-ray astronomy. The IGSPC consists of a gas scintillation proportional counter (GSPC) with a micron polyprotylene window coupled to a multiwire proportional counter (MWPC) via a calcium fluoride window. Over a sensitive area of 21 cu cm the instrument has a measured energy resolution of 17.5% (FWHM) and 1.9 mm (FWHM) spatial resolution at 1.5 keV.

21582 **(N—82-26074) A diffuse soft x-ray spectrometer.** McCammon, D. (Wisconsin Univ., Madison (USA)). Nov 1981. 23p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 379-401 (SEE N82-26055 16-88) REFS.

A design for a diffuse X-ray spectrometer utilizing Bragg reflection is described. The geometry has a very high throughput for a given physical size and allows simultaneous observation at all wavelengths within its range. Spectral resolving power is about 35 to 50. A similar unit equipped with thallium acid pthallate crystals will cover the 11 - 24 A-range with about half this throughput and twice the resolving power.

21583 **(N—82-36081) High-resolution iron-line spectroscopy.** Griffiths, R.E. (Harvard Univ., Cambridge, MA (USA). Center for Astrophysics). Nov 1981. 26p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 497-522 (SEE N82-26055 16-88) REFS.

Methods of resolving the iron lines, the most common X-ray emission lines in both galactic and extragalactic X-ray sources, are reviewed. A self-focussing crystal spectrometer is shown to be the most suitable instrument, and the optimum crystal geometry is spherical (Schnopper and Taylor 1980). The principles of operation of such a spherical crystal imaging spectrometer are examined and its sensitivity is shown to be two orders of magnitude better than a focal plane crystal spectrometer on AXAF. A Spacelab version of this payload would be very cost-effective.

21584 **(PB—82-236563) High resolution alpha spectroscopy by liquid scintillation techniques. Master's thesis.** Coombs, E.G. (Maine Univ., Orono (USA)). Aug 1980. 47p. NTIS, PC A03/MF A01.

The use of high-resolution liquid scintillation spectroscopy is described as an inexpensive and rapid method for the determination of radium-226 (an identified health hazard) and other alpha-emitting radionuclides in environmental water samples. Procedures are reported for measuring radium-226, uranium-238, and uranium-234, affording positive identification, high sensitivity due to pulse shape discrimination, and rapid sample preparation. No environmental water samples examined were found to have measurable levels of radium-226. Nonetheless, radium-226 can be detected, measured, and positively identified down to a level of 4 pCi/liter, with a recovery efficiency of 47%. The method was optimized for environmental radiation measurements by: optimizing the energy resolution; reducing the background by use of pulse shape discrimination; and optimizing the scintillation fluor. Since the extractant used will extract any actinide series element, the instrumentation and techniques developed can be applied to other areas (e.g., measurement of plutonium and uranium in environmental effects studies of the nuclear fuel cycle). Measurements of the polonium 218, 214, and 210 isotopes, and radon-222, were also made. With the present energy resolution, an alpha energy identification to within 0.4 MeV is possible.

21585 **(PB—82-253881) A high throughput inelastic neutron scattering spectrometer for the Harwell linac and the spallation neutron source.** Richardson, R.M. (Science and Engineering Research Council, Chilton (UK). Rutherford Appleton Lab.). [nd]. 77p. NTIS, PC A05/MF A01.

The detailed scientific design of a High Throughput Inelastic Spectrometer (HTIS) is presented. Methods of calculating resolutions and intensities for inverse geometry inelastic scattering spectrometers are discussed and an exact method (based on lineshape calculations) is presented. This is used in the discussion of the choice of design parameters for a beryllium filter analyzer with the HTIS installed at the Harwell linac. The changes necessary for the eventual installation at the Spallation Neutron Source are also indicated. (Copyright (c) Science and Engineering Research Council 1982.)

21586 **(PB—83-112557) Preliminary testing of a prototype portable x-ray fluorescence spectrometer. Information circular.** Patten, L.L.; Anderson, N.B.; Stevenson, J.J. (Bureau of Mines, Denver, CO (USA). Intermountain Field Operation Center). Aug 1982. 39p. NTIS, PC A03/MF A01.

The Federal Bureau of Mines participated with the National Aeronautics and Space Administration and Martin Marietta Aerospace in developing, building, and testing a portable X-ray fluorescence spectrometer for use as an analyzer in mineral-resource investigative work. The prototype battery-powered spectrometer, measuring 11 by 12 by 5 inches and weighing only about 15 pounds, was designed specifically for field use. The spectrometer has two gas-proportional counters and two radioactive sources, (109)Cd and (55)Fe. Preliminary field and laboratory tests on rock specimens and rock pulps have demonstrated the capability of the spectrometer to detect 33 elements, to date. Characteristics of the system present some limitations, however, and further improvements are recommended.

21587 **(PNL-SA—10638) Beta-particle measurement and dosimetry at NRC-licensed facilities.** Rathbun, L.A.; Fox, R.A.; Roberson, P.L.; Scherpelz, R.I. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76RL01830. 18p. (CONF-830204—6). NTIS, PC A02/MF A01. Order Number DE83007841.

From International beta dosimetry symposium; Washington, DC, USA (15 Feb 1983).

Recent experience indicates that beta-radiation fields in nuclear power reactors, fuel fabrication facilities and uranium mills are probably not being accurately monitored by instruments routinely used for this purpose. The Radiological Sciences Department, Pacific Northwest Laboratory is engaged in a project to define the extent of this beta-monitoring problem and to determine whether the performance of beta-monitoring field instruments and dosimeters can be predicted from calibration data. The initial phase of this work consists of characterizing the beta fields at several NRC-licensed facilities. This is accomplished with a silicon surface barrier detector and multi-element dosimeters. Based on the data and experience gained during characterization work, laboratory beta fields are set up for calibration of silicon detectors, field survey meters and dosimeters. All these devices are then returned to field environments where their performance can be further assessed.

21588 (PNL-SA—10656-A) **Performance testing of beta dosimeters used at Department of Energy facilities.** Roberson, P.L.; Holbrook, K.L.; Pappin, J.L. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76RL01830. 8p. (CONF-830204—5). NTIS, PC A02/MF A01. Order Number DE83007846.

From International beta dosimetry symposium; Washington, DC, USA (15 Feb 1983).

A performance test based on the American national draft standard N13.11 was conducted for dosimeter systems in use at Department of Energy facilities. The large differences in dosimeter response found were due to use of different calibration source standards and different dosimeter designs. Differences in ^{90}Sr/^{90}Y calibrations were approximately 20% or less for all but one participant. The differences observed were attributed to variable thicknesses of dosimeter elements and variable source irradiation geometries. Improved beta calibration standards will result if irradiation specifications include acceptable ranges from the depth-dose characteristics. The low-energy beta responses observed were consistent with the thicknesses of dosimeter sensitive elements and overlying filtration.

21589 (PNL-SA—10670) **Application of a multi-element beta dosimeter.** Scherpelz, R.I.; Endres, G.W.R.; Roberson, P.L. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76RL01830. 12p. (CONF-830204—8). NTIS, PC A02/MF A01. Order Number DE83007845.

From International beta dosimetry symposium; Washington, DC, USA (15 Feb 1983).

A passive beta dosimeter has been developed at the Pacific Northwest Laboratory (PNL) to more accurately account for the beta energy distribution in the radiation field. This dosimeter uses TLD chips placed under shields of varying thicknesses. Each shield attenuates the beta radiation to some degree, depending on the thickness of the shield. An indication of the beta energy spectum can therefore be obtained by examining the relative responses of the TLDs under the different shields. This indication of the spectrum allows the selection of the appropriate energy-dependent calibration factor for converting TLD response to dose. A number of these multi-element dosimeters have been exposed in unknown fields of mixed gamma and beta radiation, and doses for both radiation components have been determined.

21590 (PNL-SA—10714, pp 19-27) **Procedures for calibrating neutron personnel dosimeters.** Schwartz, R.B.; Eisenhauer, C.M. (National Bureau of Standards, Washington, DC). Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

In this chapter the philosophy behind some of the procedures for calibrating dosimeters are discussed and examples of their use are given. The main topic of this report deals with corrections for scattering effects, primarily for scattering from the surfaces of the calibration room.

21591 (PNL-SA—10714, pp 28-37) **Gamma-ray component from a Cf fission source.** Eisenhauer, C.M.; Schwartz, R.B. (National Bureau of Standards, Washington, DC). Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

The gamma-ray component of reactor and radioactive neutron sources is often significant. In this paper the measurement of gamma-ray component of bare and moderated Cf spontaneous fission neutron sources is described.

21592 (PNL-SA—10714, pp 38-48) **Background and neutron response of electrochemically etched CR-39.** Cross, W.G.; Arneja, A.; Ing, H. (Chalk River Nuclear Labs., Ontario). Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

This paper is concerned with some results obtained for track densities in CR-39 plastic - particularly those obtained by electrochemical etching - after irradiation with alpha particles and neutrons of various energies.

21593 (PNL-SA—10714, pp 49-58) **Measurement of neutron field reference data using a standardized single sphere albedo technique.** Piesch, E.; Burgkhardt, B. (Karlsruhe Nuclear Research Center, Germany). Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

In stray neutron fields the single sphere albedo technique was found to be a suitable method to establish dose equivalent reference values and appropriate field calibration factors for albedo dosemeters. With respect to a more complete interpretation of the actual neutron field the on-lie computer evaluation techniques was extended and improved in order to become a standardized technique in area monitoring. On the basis of fluence response functions now well established for the 30 cm sphere and the albedo detector, the new evaluation technique allows one to estimate actual field data in terms of neutron fluence absorbed dose, dose equivalent, fluence-to-dose conversion factors and effective quality factor.

21594 (PNL-SA—10714, pp 59-67) **Universal albedo neutron dosemeter combined with a track etch detector.** Piesch, E. Burgkhardt, B.; Hassib, G.M. (Karlsruhe Nuclear Research Center, Germany). Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

The two component albedo neutron dosemeter allows for the separate measurement of thermal field neutrons and thermal albedo neutrons. A recently developed boron plastic capsule was optimized with respect to the detector-to-phantom distance and fitted for universal use of various commercial TLD cards. In combination with CR-39 or polycarbonate track etch detectors the neutron field can be analyzed for personnel monitoring purposes.

21595 (PNL-SA—10714, pp 74-84) **Effects of additives and impurities on the properties of CR-39 neutron dosimeters.** Tarle, G. (Univ. of California, Berkeley). Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

Several problems have plagued users of commercial CR-39 for neutron dosimetry work. Large variations in sensitivity have been observed in samples received from different manufacturers, from different batches from the same manufacturer and even within a given sheet. The latter variations have taken several forms. Clear etching regions of lower sensitivity near the gasket and sometimes extending well away from the gasket in drip-like patterns have been observed. Large demarcated patches of differing sensitivity and sensitivity variations with depth have been found in many commercial samples of CR-39. In addition, we have observed a general roughening of the post-etch surface and a patchiness of bulk etching associated with contact patterns of adjacent sheets, which have been stored for extended (≧ 6 mos) periods of time. All of these problems combine to make commercially available CR-39 unreliable as a neutron dosimeter. In an attempt to identify and correct the causes of these problems, a systematic study of the effects of additives, impurities and manufacturing conditions on the uniformity of CR-39 track detectors has been undertaken, and is reported in this paper.

21596 (PNL-SA—10714, pp 85-91) **Characterization and control of a model CR-39 polymer.** Huang, S.J.; Johnson, J.F. (Univ. of Connecticut, Storrs). Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

The purposes of this study on CR-39 polymer are twofold: (1) the preparation of an uncrosslinked model polymer which closely approximates half of the CR-39 polymer. This polymer will be used for studies of the degradation of the carbon main chains of the CR-39 polymer caused by high energy radiation; and (2) to stdy the conventional CR-39 polymerization process variables which control the extent of allyl chains without adding additional chain stoppers. This will hopefully permit preparation of a material that is better for use in dosimetry than the currently available materials.

21597 (PNL-SA—10714, pp 92-102) **Spectroscopy and dosimetry of fast neutrons in the energy range (0.5 - 15) MeV using CR-39.** Faermann, S. (Soreq Nuclear Research Centre, Yavne, Israel); Eisen, Y.; Schlesinger, T.; Ovadia, E.; Kushilevski, A. Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

The CR-39 plastic detector which was discovered to be sensitive to fast neutrons above approximately 300 keV, showed itself to be a preferable high energy neutron dosimeter over polycarbonate foils and undoubtedly over NTA films. Damage sites caused mainly by proton recoil are revealed by means of chemical or electrochemical etching techniques. In a recent study, it was shown that the response of a CR-39 foil with a polyethylene radiator in front of it is not rem equivalent in the (0.5 - 15) MeV energy region. This response peaks near 2 MeV and falls to either direction by up to a factor of five if electrochemical etching is applied. The aim of the present study was to use spectroscopic means to flatten the energy response of the CR-39 detector. The inherent additional advantages of such a spectrometer-dosimeter could be applied in the growing field of high energy neutron radiotherapy and for possible assessment of the neutron spectrum in the fusion reactor blankets.

21598 (PNL-SA—10714, pp 103-119) **Progress on development of a passive, personnel neutron dosimetry/spectrometer - DOSPEC.** Griffith, R.V.; McMahon, T.A. (Lawrence Livermore National Lab., CA). Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

The advantages of a multi-component, passive personnel neutron dosimeter have been discussed over recent years. The combination of components (TLD albedo and different types of track detectors) conceptually provides valuable information about radiation field characteristics that would not be available using a singe detector. Although there is more work required to prepare, issue, process, and analyze a multicomponent dosimeter, much of the potential extra effort can be avoided by selective processing of dosimeter components. The components we have selected for use in the DOSPEC I dosimeter are TLD albedo, and 3 track etch, plastic detectors - CR-39 carbonate, polycarbonate, and LR115 (a cellulose nitrate). The TLD chips (TLD 600 and 700) are processed with conventional techniques and equipment used for photon dosimetry. The plastics are etched chemically. Track counting can be done semi-automatically using a commercial bacterial colony counter, mated to an optical microscope. Each of the four components has a sufficiently different neutron energy response that proper comparisons of responses provides some simple spectral information.

21599 (PNL-SA—10714, pp 154-161) **Personal neutron dosimeter.** Tyree, W.H.; Falk, R.B. (Rockwell International, Golden, CO). Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

A personal electronic neutron dose equivalent meter includes a neutron proton converter for providing an electrical signal having a magnitude proportional to the energy of a detected proton produced from the converter, a pulse generator circuit for generating a pulse having a duration controlled by the weighted effect of the amplitude of the electrical signal, an oscillator enabled by the pulse for generating a train of clock pulses for a longer time dependent upon the pulse length, a counter for counting the clock pulses, and an indicator for providing a direct reading and aural alarm when the count indicates that the wearer has been exposed to a selected level of neutron dose equivalent. Data are included that describe the development of the hybrid circuits electrical performance, background radiation response, gamma response, and neutron response from a californium-252 source.

21600 (PNL-SA—10714, pp 162-168) **Portable neutron spectrometer/dosimeter.** Erkkila, B.H.; Waechter, D.A.; Vasilik, D.G. (Los Alamos National Lab., NM). Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

A portable neutron spectrometer/dosimeter has been developed at Los Alamos. The instrument mates a tissue-equivalent LET detector manufactured by EG & G to an electronic package developed in the Health Division at the Los Alamos National LAboratory. The instrument includes 5-hour lifetime batteries and weighs about 8 lb. The overall dimensions are 25 cm long by 15 cm wide by 15 cm high. The elctronics include a high voltage power supply, a 128-channel pulse height analyzer, a liquid crystal display, and a microcomputer system to calculate dose and dose rate from neutrons incident on the neutron detector. Several displays are available which include an LET spectrum and dose spectra as a function of keV per micron in the display. The integrated dose and the dose rate can also be displayed.

21601 (PNL-SA—10714, pp 169-179) **Neutron dosimeters based on hydrogenous materials.** Brackenbush, L.W. (Pacific Northwest Lab., Richland, WA). Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

All existing personnel neutron dosimeters suffer from a common problem - all have an energy response problem. Ideally, the dosimeters' response should match that of tissue. Protons generated by the elastic scatter of neutrons are the major source of neutron dose for almost all practical neutron energies. It is believed that a dosimeter incorporating hydrogen and reacting to the energy transferred from proton recoils would greatly reduce the energy dependence problem. At slow neutron energies, energy is transferred to tissue by N(n,p)C and H(n,γ)D reactions. Incorporating nitrogen into the dosimeter material may help the energy dependence problem at low neutron energies. Three areas of research were investigated: the reported change of conductivity of cellulose acetate under neutron irradiation; organic semiconductors; and other hydrogenous materials. All of these devices rely upon hydrogen to affect changes in the materials.

21602 (PNL-SA—10714, pp 180-185) **Applications of resonance ionization spectroscopy in neutron dosimetry.** Whitaker, T.J.; Hurst, G.S. (Atom Sciences, Inc., Oak Ridge, TN). Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

Resonance Ionization Spectroscopy (RIS) is a new analytical technique which is orders of magnitude more sensitive than previous methods of atomic analysis. In this method, lasers are used to selectively excite specific electronic transitions in the element being analyzed. A second laser photon can then ionize the excited atoms. Commercial lasers have sufficient intensity to assure that every atom located in the central portion of the laser beam will be ionized, and therefore can be detected. In this paper the concept of a xenon-containing matrix (XCM) which would release xenon atoms when exposed to neutrons is explored. Accumulated xenon would be measured using RIS to determine total dose. The total dosimeter would consist of an XCM, a radiator, and an encapsulation around both to contain released xenon atoms.

21603 (PNL-SA—10714, pp 186-192) **Radiochromic waveguides for sensitive neutron and gamma dosimetry.** Kronenberg, S. (Army Electronics Tech. and Devices Lab., Fort Monmouth, NJ). Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

Utilizing ionizing radiation induced changes (by anomalous dispersion) in the index of refraction in radiochromic dyes actually yields four different systems of radiochromic waveguide dosimeters. These four cases are discussed in this paper.

21604 (PNL-SA—10714, pp 193-216) **New laser technique revives old ideas for thermoluminescence neutron dosimetry.** Braeunlich, P. (Washington State Univ., Pullman); Brown, M.; Gasiot, J.; Fillard, J.P. Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

Laser heating is discussed as a means to evaluate thermoluminescence dosimeters in neutron dosimetry. Direct energy coupling from the photon beam to the phonons of the TL material permits heating of thin layers with rates of temperature increase exceeding 10^4 Ks^{-1}. Rapid TLD evaluation will allow the design of dosimetry badges containing a number of different small thin film TLD elements in various orientations and behind appropriate filters, hydrogenous radiators, etc. Desired redundance is readily possible by using back-up TLDs for every specific task. Reading occurs with a scanning laser beam rather than by mechanically manipulating the TLD toward a fixed heat source. Improvements in the signal-to-noise ratio of up to a factor of 1000 are readily obtained. Thus, sensitive thin-film TLDs can be designed with negligible self-shielding for thermal neutrons in albedo applications and with known, nearly energy dependent cavity correction factors for dosimetry in mixed n-γ fields. Due to the greatly increased sensitivity possible with fast laser heating, significant advances are expected in the fast neutron dosimetry techniques which are based on hydrogeneous proton radiators or LET-dependent slow peak formation.

21605 (PNL-SA—10714, pp 217-225) **Personnel neutron dosimetry by a combied method of decoration and electrochemical etching.** Espinosa, G. (Instituto de Fisica, Mexico City, Mexico); Moreno, A.; Golzarri, J.I.; Griffith, R.V. Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

A method for particle-track enlargement, background reduction and optical contrast enhancement in plastic detectors has been developed based on decoration with Rhodamine-B dye during ultrasonic etching. Alternative processing conditions and parameters have been evaluated experimentally, including pre-irradiation washing, etch duration, sensitization, and electrochemical etching. The plastics used include Triafol, Lexan, and CR-39. Using fission fragments we obtained track enlargement of 30% with significant improvement in contrast and visibility. The techniques are being developed for highly automated neutron dosimeter processing, including readout with a micro-densitometerand computer evaluation.

21606 (SLAC-PUB—2990) **New developments in segment ancillary logic for FASTBUS.** Walz, H.V.; Bertolucci, B. (Stanford Linear Accelerator Center, CA (USA)). Oct 1982. Contract AC03-76SF00515. 5p. (CONF-821011—48). NTIS, PC A02/MF A01. Order Number DE83007010.

From IEEE nuclear science symposium; Washington, DC, USA (20 Oct 1982).

Segment Ancillary Logic hardware for FASTBUS systems provides logical functions required in common by all devices attached to a segment. It controls the execution of arbitration cycles, and geographical address cycles, and generates the system handshake responses for broadcast operations. The mandatory requirements for Segment Ancillary Logic in the FASTBUS specifications are reviewed. A detaified implementation based on ECL logic is described, and the hardware to be used on an ECL cable segment for an experimental FASTBUS system at SLAC is shown.

21607 (SLAC-PUB—2991) **Progress on the SLAC SNOOP diagnostic module for FASTBUS.** Walz, H.V.; Gustavson, D.B.; Downing, R. (Stanford Linear Accelerator Center, CA (USA); Illinois Univ., Urbana (USA)). Nov 1982. Contract AC03-76SF00515. 3p. (CONF-821011—47). NTIS, PC A02/MF A01. Order Number DE83007009.

From IEEE nuclear science symposium; Washington, DC, USA (20 Oct 1982).

A SNOOP Diagnostic Module for FASTBUS is under development at SLAC. The SNOOP Module resides on a FASTBUS crate segment and provides diagnostic monitoring and testing capability. It consists of a high-speed ECL front-end to monitor and single-step segment operations, a simple master interface, and a control processor with two serial communication ports. Module features and specifications are summarized, and prototype hardware is shown.

21608 (SLAC-PUB—2994) **FASTBUS controller module using a multibus MPU.** Deiss, S.R. (Stanford Linear Accelerator Center, CA (USA)). Oct 1982. Contract AC03-76SF00515. 4p. (CONF-821011—46). NTIS, PC A02/MF A01. Order Number DE83007008.

From IEEE nuclear science symposium; Washington, DC, USA (20 Oct 1982).

The architecture, adaptability and performance of SLAC's single board controller module will be detailed. Example uses with an 8086 MPU and with a 68000 MPU will be given. Details of circuit design and software interface will be provided.

21609 (SLAC-PUB—3008) **Introduction to FASTBUS.** Logg, C.A. (Stanford Linear Accelerator Center, CA (USA)). Nov 1982. Contract AC03-76SF00515. 8p. (CONF-821201—13). NTIS, PC A02/MF A01. Order Number DE83007017.

From Fall DECUS US Symposium; Anaheim, CA, USA (6 Dec 1982).

FASTBUS is a standardized modular 32-bit data-bus system for performing data acquisition, data processing, and control in high energy physics and other applications. It has been developed by the Fast System Design Group of the U.S. NIM Committee. Presented here is an overview of the FASTBUS hardware specification, the operation of the FASTBUS protocol, the implications that the use of FASTBUS has for software systems, and some of the computer to FASTBUS interfaces developed to date.

21610 **Lithium-6 coated wire mesh neutron detector.** Young, C.A.; Geelhood, B.D. US Patent Application 6-381,099. 3 Jun 1982. 22p.

It is the primary object of the present invention to provide a lighter, more compact neutron detector of high sensitivity. It is a concomitant object of the present invention to disclose a thin lithium-6 based neutron detector which contains a large amount of useful lithium-6 within a relatively small detector volume. It is a further object of the present invention to disclose a lithium neutron detector in which the lithium detector portion is self supporting. It is another object of the present invention to disclose a lithium neutron detector which requires only one layer of counting wires for many layers of detectors. It is further object of the present invention to disclose a neutron detector that is easier to manufacturer than prior art designs.

21611 **Ionizing radiation dose monitor using silicon-on-sapphire transistor.** Srour, J.R.; Curtis, O.L.; Othmer, S.; Chen, S.C.C. US Patent Application 6-368,473. 14 Apr 1982. 9p.

A reusable solid state device is disclosed which monitors ionizing radiation. The device is a silicon-on-sapphire n-channel MOS transistor having a back-channel leakage current which is proportional to total radiation dose. To return the monitor to its original reusable state, the drain-to-source transistor bias is reduced to zero while irradiating the device to an appropriate dose level.

21612 **Calorimetry in high-energy physics.** Fabjan, C.W.; Ludlam, T. (CRN, Geneva, Switzerland). *Annual Review of Nuclear Science;* **32**: No. 1, 335-389(1982). Contract AC02-76CH00016.

A review of the design and applications of cascade detectors is presented. (AIP)

21613 (CAPE—2774) **Neutron REM survey meter (Engineering Materials).** (Lawrence Livermore National Lab., CA (USA)). 1982. Contract W-7405-ENG-48. (LLNL/MISC—4083-82). TIC. Order Number DE83005036.

Engineering drawings are given of a neutron survey meter with an energy dependence similar to the dose-equivalent curve. The survey meter is a hand-held, self-contained, count-rate-meter used in conjunction with a modified Andersson-Braun remmeter as the neutron detection device. The electronic portion of the meter is constructed in a cylindrical steel cabinet attached to one end of the polyethylene remmeter assembly. Electronic circuits feature CMOS integrated circuits for high reliability and low power drain. The power is provided by eight C size batteries. The meter is three and one-half inches in diameter (2.9 inch scale) and calibrated at 0 to 10 MILLIREM/H NEUTRONS, with battery checkmark. The meter range is multiplied by switch selectable factors of X0.1, X1, X10, X100. The detector is a Boron Trifluoride (BF_3) Neutron Proportional Counter type made by N. Wood. This Model G-10-2A is moderated by a modified Andersson-Braun remmeter (LLNL Dwg. No. AAA 77-110319-0A). The instrument is calibrated by LLNL Standards and Calibration Department to read 100% of the 2π geometry of Cf-252. The instrument dimensions are 21.6 centimetres diameter by 34.9 centimetres long (8.5 inches diameter by 13.75 inches long). The polyethylene remmeter has a suitcase-type handle on top and four rubber mounting feet on the bottom. Total weight of the assembly with batteries is 10.4 kilograms (22 pounds, 15 ounces). (WHK)

21614 **Superconducting toroidal particle detector for high-energy physics research.** Materna, P.; Bonanos, P.; Heitzenroeder, P.; File, J.; Pope, B. (Princeton Univ, NJ, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 285-288(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

A conceptual design is presented for a superconducting toroidal particle detector proposed to detect muons at the ISABELLE accelerator. The device features a clear central bore of 1 meter radius; a transparency factor (open space between coils) of 60%; and a relatively large integrated bending power of 3.5 T-m. The outside dimensions of the device are 15 m overall length and 10 m outside diameter. Magnetic fields and forces are analyzed, and the resulting stresses are shown to be well within allowable limits.

21615 **(CAPE—2763) Alpha Survey Meter (Engineering Materials).** (Lawrence Livermore National Lab., CA (USA)). 3 Apr 1978. Contract W-7405-ENG-48. TIC. Order Number DE83005774.

7 35 MM aperture cards.

The survey meter is a hand-held, self-contained count-ratemeter used in conjunction with the air proportional probe type LEA76-2009 to survey for alpha particle contamination ranging from a few counts per minute to 10^6 counts per minute. The unit is constructed in a light weight aluminum case protected with blue epoxy paint. Electronic circuits feature CMOS integrated circuits for high reliability and low power drain. The power is provided by eight size C batteries. The meter is a three and one-half inch meter (2.9 inch scale) calibrated 0-100 counts/min with battery check mark. The detector is an air proportional probe type LEA76-2009 with active area of 120 cm^2. The calibration is by LLL Standards to read 100% of 2π geometry of ^{239}Pu. The calibration is sensitive to changes in air pressure. (WHK)

21616 **(CAPE—2804) SAM SLAVE CAMAC Analog Branch Mark III SPEAR (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83006215.

The Logic Diagram delineates the basic logic of the SAM (SLAVE ANALOG MODULE) SLAVE CAMAC Analog Branch. This device can only be used with and a complement to the SPORT (Smart Port) normally used with the SLAC BADC (Brilliant Analog to Digital Converter). SAM is the receiving module for SPORT and cannot stand alone. This device is used extensively at SLAC on the Mark III detector at SPEAR.

21617 **(CAPE—2802) Mark III Asynchronous Console Interface (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83006214.

The Drawing List DL 135-687-00-RO and the three other drawings listed provide partial data and specifications for construction of the SLAC Mark III Asynchronous Console Interface unit. This device is a special CAMAC interface to allow ASCII (American Standard for Computer Information Interchange) access to a computer. This device is essentially a keyboard and is a serial port system. The drawing list has 22 drawings listed, 4 of which are provided here.

21618 **(CAPE—2803) SPORT-SPEAR Mark III Electronics (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83006216.

The Drawing List DL 135-678-00-RO and the drawings listed thereon provide the specifications for construction of the SPORT-SPEAR Mark III Electronics. SPORT stands for Smark Port. This device is an adapter for the SLAC BADC (Brilliant Analog to Digital Converter) providing up to 5 ports whereas the BADC and SPORT takes signals from experimental equipment and directs them to other equipment and micro computers for processing and storing. These units are housed in standard Camac crates.

21619 **(CAPE—2688) Crate verifier module (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83006213.

The Drawing List DL 135-267-00R0 and the drawings listed thereon provide the data and specifications to construct the SLAC Crate Verifier Module as used on the SPEAR Mark III Detector. This unit is a diagnostic device which scans the backplane of a CAMAC crate to record information and analyze the data to determine if the crate is working properly.

4402 Radiation Effects On Instrument Components, Instruments, Or Electronic Systems

REFER ALSO TO CITATION(S) 21355

21620 **(AD-A—118864/8) MNOS/SOS radiation hardness performance and reliability study. Interim report Aug 79-Aug 80.** Hampton, F.L.; Cricchi, J.R. (Westinghouse Defense and Electronic Systems Center, Baltimore, MD (USA). Advanced Technology Labs.). May 1982. 165p. NTIS, PC A08/MF A01.

In this investigation the endurance-retention characteristics of fast-write MNOS memory structure, and radiation tolerance of metal-gate dual-dielectric and polysilicon-gate all-oxide devices have been evaluated. Writing and clearing speed have been studied with respect to the NH3:SiH4 ratio (APCVD), and NH3:SiC12H2 ratio (LPCVD). The films deposited with a low NH3:SiC12 ratios could be written and cleared with shorter pulse widths; however, a degradation in retention was observed. An improvement in the endurance retention product of a drain source protected transistor structure has been realized by oxidizing the memory nitride followed by an H2 anneal immediately after deposition. The film was deposited with a LPCVD reactor at 750 deg with a NH3:SiC12H2 ratio of 9:1. Oxidation was performed in steam at 900 C, as was the subsequent H2 anneal. The effect of total dose radiation was found to be more severe for a positive bias. The all oxide polysilicon gate transistor structures were observed to be relatively soft, however results from capacitor structures shows promise in developing a radiation tolerant polysilicon-gate all-oxide gate structure.

21621 **(UCRL—88702) High-power microwave-pulse susceptibility of discrete semiconductor devices.** McConaghy, C.F.; Martin, L.C.; Yee, J.H. (Lawrence Livermore National Lab., CA (USA)). 1983. Contract W-7405-ENG-48. 6p. (CONF-830314—2). NTIS, PC A02/MF A01. Order Number DE83007353.

From 2. national conference on high power microwave technology; Adelphi, MD, USA (1 Mar 1983).

This paper describes work in process in the investigation of the susceptibility of semiconductor devices to short pulses of microwave energy. This investigation includes a combination of testing, circuit modeling, and basic physics modeling. The testing includes both unipolar (video) and microwave (GHz range) pulses in the nanosecond time regime. Modeling is oriented toward the explanation of second-breakdown phenomena and the development of a breakdown level prediction model. Preliminary results have been obtained for the 2N918 transistor.

21622 **Effect of high energy neutrons on a microchannel plate detector.** Persing, R.; Medley, S.S. (Princeton Univ, NJ, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1086-1089(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The response of a chevron microchannel plate (MCP) to high energy neutrons was measured to be 0.17% for 2.5 MeV-DD neutrons and 0.64% for 15 MeV-DT neutrons. The higher response measured for the 14 MeV-DT neutrons is attributed to background gamma radiation or 'contamination' induced by neutron collisions with materials located between the neutron source and the MCP detector. Due to their lower energy, the 2.5 MeV-DD response measurements are expected to be relatively free of gamma contamination and hence, indicative of the actual response of a MCP detector to neutrons in the 1-10 MeV energy range.

21623 Neutron- and gamma-induced transient effects in optical fibers. Lyons, P.B. (Los Alamos Scientific Lab., NM); Looney, L.D.; Golob, J.; Robichaud, R.; Seno, R.; Madrid, J.; Hocker, L.; Nelson, M. pp 379-392 of Fiber optics: advances in research and development. Bendow, B.; Mitra, S.S. (eds.). New York, NY; Plenum Publishing Corp. (1979).

Both luminescence and absorption are observed when optical fibers are exposed to ionizing radiation. Potential applications of optical fibers include data transmissions in the presence of radiation and an understanding of radiation effects on fibers is therefore critical. Many previous investigations have studied transient radiation effects using pulsed electron and x-ray beams and long term effects using x-ray, gamma, electron, and neutron sources. However, no data for neutron-induced transient phenomena have been obtained to date. Since neutron bombardment will result in atomic displacement to a greater extent than electron sources, it is not a priori evident that neutron and electron absorption effects are similar. Furthermore, since luminescence has been shown to be mainly of Cerenkov orgin, neutron induced luminescence should be significantly less, on an absorbed dose basis, than electron induced luminescence. The experimental data presented herein are the first neutron-induced transient absorption and luminescence measurements on optical fibers.

21625 (CONF-821227—1) Focusing and imaging sharp line x-ray and gamma-ray sources using variable-metric diffraction crystals. Smither, R.K. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 24p. NTIS, PC A02/MF A01. Order Number DE83007789.

From 11. Texas symposium on relativistic astrophysics; Austin, TX, USA (12 Dec 1982).

A new method has been devised for focusing and imaging the radiation from sharp-line sources of x-rays and gamma-rays, which makes use of variable-metric diffraction crystals. A variable-metric diffraction crystal is one in which the spacings between the crystalline planes is varied as a function of position in the crystal by either the application of a thermal gradient or by changing the composition of a two component or multiple component crystal. This change in planar spacing changes the Bragg diffraction angle for monochromatic radiation as a function of position in the crystal and makes it possible to obtain focusing and in some cases imaging of a sharp-line point source or parallel beam source. This new approach to focusing x-rays and gamma-rays is used to design a number of gamma ray telescopes suitable for focusing the 511 keV annihilation radiation from the strong source of the center of our galaxy. The new designs are surprisingly efficient with approximately 20% of the radiation incident on the variable-metric diffraction crystals being focused on the image spot. Crystals of Ge, Ge + Si, Si, and quartz are used with mosaic widths of 10 arc sec. The size of the telescope can be scaled up or down without affecting the angular resolution or the energy resolution. The largest model described is 50 m long and has 10 crystal diffraction ring assembles with radii between 71 and 200 cm. The total area of the diffraction crystal is 24,610 cm^2 and the effective area (total x diffraction coefficient x transmission) is 4745 cm^2. An example of a smaller telescope is also given that is only 12.5 m long and has an effective area of 297 cm^2.

21626 (N—82-24260) Operating principles of optico-electronic instruments. Fedorov, V. (Joint Publications Research Service, Arlington, VA (USA)). Mar 1982. 3p. NTIS, PC A07/MF A01.

In its USSR Rept.: Space, No. 15 (JPRS-80424) p 59-61 (SEE N82-24253 15-12) Transl. into ENGLISH from Aviats. Kosmonavt. (USSR), no. 11, Nov. 1981 p 22-23.

The term otpico-electronic customarily refers to instruments in which processing of information on the subject under observation entails conversion of radiant energy to electrical energy. Such instruments are often components of sighting and navigation systems and are intended for detection and recognition of visible terrestrial features and for measurement of their coordinates during the day under normal weather conditions and when haze is present. Whether or not features with different colors and contrast levels can be detected and recognized depends on the observation conditions, the resolving power and sensitivity of the eye, and the properties of the optico-electronic instrument that governs its basic parameters. Atmospheric conditions have a considerable influence on the transmission of electromagnetic waves. In a clear atmosphere or in haze, short infrared waves (0.76 to 1.5 microns) in the 0.95 to 1.05 and 1.2 to 1.7 micron regions are transmitted better than waves falling into the visible region of the spectrum (0.4-0.76 microns). As a consequence, the distance from which objects can be detected with the aid of optico-electronic instruments operating in the region of short infrared wavelengths should be somewhat greater than that from which they can be discerned with the naked eye.

21627 (NASA-CASE-NPO—15423-1) Ion mass spectrometer. Neugebauer, M.M. (JPL, California Inst. of Tech., Pasadena); Clay, D.R. (JPL, California Inst. of Tech., Pasadena); Golstein, B.E. (JPL, California Inst. of Tech., Pasadena); Goldstein, R. (JPL, California Inst. of Tech., Pasadena). (Jet Propulsion Lab., Pasadena, CA (USA)). Mar 1982. 16p. NTIS, PC A02/MF A01.

An ion mass spectrometer is described which detects and indicates the characteristics of ions received over a wide angle, and which indicates the mass to charge ratio, the energy, and the direction of each detected ion. The spectrometer includes a magnetic analyzer having a sector magnet that passes ions received over a wide angle, and an electrostatic analyzer positioned to receive ions passing through the magnetic analyzer. The electrostatic analyzer includes a two dimensional ion sensor at one wall of the analyzer chamber, that senses not only the lengthwise position of the detected ion to indicate its mass to charge ratio, but also detects the ion position along the width of the chamber to indicate the direction in which the ion was travelling.

21628 (ONERA-NT—1981-8) Laser techniques in chemical diagnostics. Attal, B. (Office National d'Etudes et de Recherches Aerospatiales (ONERA), 75 - Paris (France)). 1981. 58p. NTIS, PC A04/MF A01.

REFS.

Optical diagnostic techniques that are applicable to fluid dynamics, combustion research and atmospheric sounding are reviewed. Development of these methods is outlined, stressing the use of lasers. Three of these techniques are discussed in detail: (1) laser induced fluorescence (LIF), (2) spontaneous Raman scattering (SRS), and (3) coherent antistokes Raman scattering (CARS). The LIF method is found particulary well-suited for trace species analysis. Low scattering cross section is the major drawback of SRS, however, it is still preferred when the concentration of major constituents of a gas system is to be measured. The unique properties of CARS, i.e. good signal strength and absence of fluorescence interference, make this technique the best for nonintrusive flame diagnostics.

21629 **(REPT—482-DT-4) Study of image processing in a photon detection assembly. Final report.** Matticari, G.; Cumeni, D. (Officine Galileo S.p.A., Florence (Italy)). Jul 1981. 130p. NTIS, PC A07/MF A01.

ESA.

The design, software, and electronics of a photon detector are described. A lens whose focal plane is coincident with the photocathode external face discriminates the direction of incoming photons. The intersifier stage includes an S-20 type photocathode, curved channel microchannel plate capable of high gain, and a phosphorus screen whose spectral response matches that of the detector. Between the photocathode and the input face of the microchannel plate, a proximity focusing operation permits the photons from the photocathode to enter the microchannels with enough energy to evoke the secondary emission. The optical coupling phosphor CCD matrix array relay optics consist of a fiber optics bundle. A management subroutine decides the kind of operation to be executed during software test activities, i.e., program definition or application program realization.

21630 **(SAND—82-2918) ORVIS: optically recording velocity interferometer system. Theory of operation and data-reduction techniques.** Bloomquist, D.D.; Sheffield, S.A. (Sandia National Labs., Albuquerque, NM (USA)). Feb 1983. Contract AC04-76DP00789. 32p. NTIS, PC A03/MF A01. Order Number DE83008309.

An optically recording velocity interferometer system (ORVIS) has been developed to measure particle velocity histories in shock wave experiments on condensed matter. The interferometer fringe motion is recorded with a high speed electronic streak camera, rather than with photomultiplier tubes and oscilloscopes as in previous interferometry systems. With this approach, the particle velocity of a witness foil in a detonation wave experiment was measured with 300-ps time resolution. We believe that 20-ps time resolution can be achieved with this technique which would represent an improvement of two orders of magnitude over previous measurement techniques. The optical design is described along with techniques for operation. The data reduction system is described including a computer program for digitizing and analyzing the recorded images.

21631 **(SAND—82-2937C) IIR algorithms for adaptive line enhancement.** David, R.A.; Stearns, S.D.; Elliott, G.R.; Etter, D.M. (Sandia National Labs., Albuquerque, NM (USA); New Mexico Univ., Albuquerque (USA)). 1983. Contract AC04-76DP00789. 4p. (CONF-830407—1). NTIS, PC A02/MF A01. Order Number DE83005009.

From International conference on acoustics, speech, and signal processing; Boston, MA, USA (14 Apr 1983).

We introduce a simple IIR structure for the adaptive line enhancer. Two algorithms based on gradient-search techniques are presented for adapting the structure. Results from experiments which utilized real data as well as computer simulations are provided.

21632 **Simple reverse bending machine for low cycle fatigue at elevated temperatures.** Yavari, P.; Langdon, T.G. (Departments of Materials Science and Mechanical Engineering, University of Southern California, Los Angeles, California 90089-1453). *Review of Scientific Instruments;* **54**: No. 3, 353-356(Mar 1983). Contract AM03-76SF00113.

A simple reverse bending machine is described for tests in low cycle fatigue at elevated temperatures. The machine is easy to construct, simple to operate, and it is especially useful for detailed metallographic investigations in low cycle fatigue. The machine has been used for strain amplitudes up to +- 0.5% and frequencies of the order of 10^{-3}—10^{-1} Hz. Some typical experimental results are described for high-purity aluminum tested in air at 300 °C.

21633 **Penetrameter positioner for bore-side radiography of tubes.** Davis, E.V.; Foster, B.E. (to Dept. of Energy). US Patent 4,368,996. 18 Jan 1983. Filed date 27 Jan 1981. vp.

PAT-APPL-228838.

A positioner is provided for placing plaque or wire penetrameters, as used in radiographic inspection, in close proximity with the inner wall of tubing at any desired location along the tubing. The positioner head carrying the penetrameter is inflatable whereby it is positioned in the deflated condition, inflated to place the penetrameter against a weld to be inspected in the tubing wall, and then deflated during removal. If desired, the penetrameter holder may be used to center the radiographic source on the axis of the tube.

21634 **Sludge sampler.** Ward, R.C. (to Dept. of Energy). US Patent 4,367,657. 11 Jan 1983. Filed date 25 Jun 1981. vp.

PAT-APPL-277435.

The disclosure relates to a sludge sampler comprising an elongated generally cylindrical housing containing a baffle containing an aperture. Connected to the aperture is a flexible tubing having a valve for maintaining and releasing pressure in the lower end of the housing and exiting the upper end of the housing. The lower end of the housing contains a ball check valve maintained in closed position by pressure. When the lower end of the device contacts the sludge bed, the pressure valve is opened, enabling sludge to enter the lower end of the housing. After the sample is collected the valve is closed. An upsetting pin opens the valve to empty a sludge sample after the sample is removed from the fluid.

21635 **New technique for measuring excited-state lifetimes in ions using rapid Doppler switching.** Gaillard, M.L.; Pegg, D.J.; Bingham, C.R.; Carter, H.K.; Mlekodaj, R.L.; Cole, J.D. (University of Tennessee, Knoxville, Tennessee 37996). *Physical Review* [*Section*] *A: General Physics;* **26**: No. 4, 1975-1983(Oct 1982). Contract AS05-76ER04936.

A new and accurate method for measuring lifetimes of excited ionic states is described. The method employs selective laser excitation and rapid Doppler tuning to convert the spontaneous exponential decay of the excited state into a spatial variation of fluorescence intensity. The technique has been tested on the 6p ^{2}P/ sub 3/2/^{0} Ba II level and our final result of 6.35 +- 0.09 nsec is in excellent agreement with previous high-precision measurements. The method should make it possible to routinely achieve 1 percent accuracy measurements of ionic lifetimes longer than a lower limit of a few nanoseconds, set by transit-time broadening and ion-beam velocity spread.

21636 **Transmission gratings for the extreme ultraviolet.** Arakawa, E.T.; Caldwell, P.J.; Williams, M.W. (Oak Ridge National Lab., TN). *Optical Engineering;* **20**: No. 5, 753-755(Sep-Oct 1981). Contract W-7405-ENG-26.

A technique has been developed for producing transmission diffraction gratings suitable for use in the extreme ultraviolet. Thin self-supporting films of a transparent material are overlaid with several thousand opaque metallic strips per mm. Gratings with 2100, 2400, and 5675 1/mm have been produced and tested. Representative spectra over the wavelength range from 17.2 to 40.0 nm are given for a grating consisting of a 120 nm thick Al support layer overlaid with 2400, 34 nm thick, Ag strips/mm. The absolute transmittance is ca 13% at 30 nm, and the efficiency in the first order is ca 16%. The observed resolution of 0.2 nm is acceptable for many of the potential applications. These gratings have several advantages over the two presently available alternatives in the extreme ultraviolet (i.e., reflection gratings used at grazing incidence and free-standing metallic wire transmission gratings). Fabrication is relatively quick, simple, and cheap. The support layer can also serve as a filter and help conduct excessive heat away. Higher line densities and hence higher resolutions are possible, and when used at normal incidence the spectra are aberration free. Suitable materials, component thicknesses, and line densities can be chosen to produce a grating of optimum characteristics for a particular application.

21637 **ASTM standard practice for testing fixed-wavelength photometric detectors used in liquid chromatography.** Wolf, T. (Colgate-Palmolive Co., Piscataway, NJ); Fritz, G.T.; Palmer, L.R. *Journal of Chromatographic Science;* **19**: 387-391(Aug 1981).

A standard testing procedure has been devised for fixed-wavelength photometric detectors (FWPD) used in liquid chromatography. The need for this procedure, the objectives for developing it, and the means for accomplishing the objectives are outlined. Salient details of the procedure are discussed including the determination of nine characteristics of FWPDs. After an evaluation by ten laboratories, the revised procedure was balloted and revised again according to ASTM procedures (1). The final revised version is now available from ASTM as Standard Practice E 685 (2).

21638 **An ultrahigh-sensitivity facility for electrical resistivity experiments in a liquid helium environment.** Ockers, S.T.; Berger, A.S. (Argonne National Lab., IL). *Journal of Physics E: Scientific Instruments;* **13**: 273-275(1980).

A measurement facility is described which provides direct digital output of the electrical resistance of a metal sample, immersed in He II at 1.7 K, with an uncertainty of less than 8×10^{-10} Ω and a linearity of +/- 0.005%. When it is used to measure the concentration of thermally induced (quenched-in) vacancy-type crystal lattice defects in copper and aluminium the equivalent concentration sensitivity is about 10^{-8}. The system uses a microprocessor-based control and calculation program stored in a non-volatile memory for ease of operation when the equipment is switched on or off.

21639 (SAND—82-2002C) **Proceedings of the second PFN uranium logging seminar.** (Sandia National Labs., Albuquerque, NM (USA)). Jan 1983. Contract AC04-76DP00789. 153p. (CONF-8105203—). NTIS, PC A08/MF A01. Order Number DE83007368.

From 2. prompt fussion neutron uranium logging seminar; Albuquerque, NM, USA (19 May 1981).

The Prompt Fission Neutron (PFN) uranium logging system developed by Sandia National Laboratories for the US Department of Energy is described in some detail in papers by the staff that was involved in the final phase of the development project, and by others associated with the project as users of the logging probe or builders of some of the probe hardware. Descriptions are provided of the probe's electronic circuits, the uphole instrumentation, the log interpretation technique, field experience, neutron detection hardware, neutron generator design, life-test results, and observations by Bendix Field Engineering Corporation personnel regarding the use of the probe and its results.

21640 (SAND—82-2002C, pp 8-20) **Principles of the PFN probe.** Humphreys, D.R. Jan 1983. NTIS, PC A08/MF A01.

From 2. prompt fussion neutron uranium logging seminar; Albuquerque, NM, USA (19 May 1981).

This paper outlines the physical principles of the Sandia Prompt Fission Neutron (PFN) uranium logging probe and briefly describes its main parts.

21641 (SAND—82-2002C, pp 38-55) **Description of PFN probe electronic circuits.** Weinlein, J.H. Jan 1983. NTIS, PC A08/MF A01.

From 2. prompt fussion neutron uranium logging seminar; Albuquerque, NM, USA (19 May 1981).

The PFN probe has three modules: (1) the dc-dc converter/reservoir control module; (2) the pulse generating assembly module; (3) the detector/TTA module. The configuration of these modules within the probe casing is shown. At present the modules are tied together with connectors. To minimize noise pickup, coaxial pins were employed for signal lines. Because these connectors proved to be extremely difficult to procure, a design eliminating connectors and hard-wiring the modules together has been completed.

21642 (SAND—82-2002C, pp 56-68) **Uphole instrumentation for PFN logging.** Stephenson, W.A. Jan 1983. NTIS, PC A08/MF A01.

From 2. prompt fussion neutron uranium logging seminar; Albuquerque, NM, USA (19 May 1981).

The instrumentation system described here has evolved over approximately a five year period; however, it is not the only way to gather and store the data for PFN logging. This description should enable the potential user to understand the objectives and choose a method most suitable for his capabilities and requirements. Sandia's method of PFN logging uses two logging tools. The PFN tool is used for locating and logging zones of interest. A second tool is used to obtain a borehole caliper and a compensated density log of these zones which is used for log interpetation. The Sandia logging truck uses a conventional winch system and type-4HO logging cable. The data are collected and stored on magnetic tape. Space limitations did not allow inclusion of a minicomputer and output devices in the logging truck; consequently, data analysis cannot be done on site. Data-analysis software has been written for a stand-alone PDP 11/34 minicomputer and could be used for a minicomputer in the logging truck if space were available. An analog display of epithermal energy neutrons is used in the logging truck to enable the operator to locate the zones of interest. The analog signal is not used for data analysis or for grade estimates.

21643 (SAND—82-2002C, pp 69-76) **Measurement instrumentation for 14-MeV neutrons.** Riggan, W.C. Jan 1983. NTIS, PC A08/MF A01.

From 2. prompt fussion neutron uranium logging seminar; Albuquerque, NM, USA (19 May 1981).

The neutron generator output must be known to accurately assay the uranium in a formation by PFN logging. Therefore, the 14-MeV neutron generator output must be calibrated at some interval depending upon the stability of the generator and the logging accuracy required. At Sandia National Laboratories, we perform neutron measurements that are traceable to first principles which assure us of consistent measurements over periods of years. One detector, designated the lead probe, serves as a secondary standard which may be used directly, or to calibrate other detectors that are more suitable for some measurements. This document describes these 14-MeV source neutron detection systems and their application to the PFN uranium logging operation. Both existing techniques and methods under development are described.

21644 (SAND—82-2002C, pp 77-83) **Alternate neutron output calibration techniques for users of a PFN probe.** Jensen, D.H. Jan 1983. NTIS, PC A08/MF A01.

From 2. prompt fussion neutron uranium logging seminar; Albuquerque, NM, USA (19 May 1981).

The detector systems and the details of the calibration technique used by Sandia in the calibration of the neutron output of the PFN probe have been described previously. This paper describes both the basic calibration concepts and Sandia's proposals for calibration approaches by industry PFN users. A brief description of the licensing requirements for the use of the PFN probe and calibration system is also contained.

21645 (SAND—82-2002C, pp 84-99) **PFN field logging.** Stephenson, W.A. Jan 1983. NTIS, PC A08/MF A01.

From 2. prompt fussion neutron uranium logging seminar; Albuquerque, NM, USA (19 May 1981).

Of primary interest here is the PFN tool. The tool is designed so that no disassembly or field maintenance is necessary for normal operation. It should be obvious, however, that any device with the large number of components contained by this tool will have occasional failures. A van was equipped to accompany the logging truck because the logging tools were too long and too numerous to be carried by the truck. Due to the experimental nature of the project, this same van was also equipped to provide a place for field service and neutron output calibration equipment for the PFN tool.

21646 (SAND—82-2002C, pp 100-118) **Discussion of the performance and calibration of two PFN probes.** Sterling, D.L. (Bendix Field Engineering Corp., Grand Junction, CO). Jan 1983. NTIS, PC A08/MF A01.

From 2. prompt fussion neutron uranium logging seminar; Albuquerque, NM, USA (19 May 1981).

The US Department of Energy at the Grand Junction Operation (GJO) has two of the Sandia-built prompt fission neutron (PFN) probes. In this paper I assume that the reader is familiar with the design and operation of the probe. I give a thumbnail sketch of the hardware and software used in our uranium logging truck and touch on some of the problems we have faced in using the probe. Then I go into the calibration procedures used at GJO and discuss some of the problems in the measurement itself. This paper serves as a starting point for those in industry involved in the calibration of a PFN probe.

21647 (SAND—82-2002C, pp 119-135) **Log interpretation.** Barnard, R.W. Jan 1983. NTIS, PC A08/MF A01.

From 2. prompt fussion neutron uranium logging seminar; Albuquerque, NM, USA (19 May 1981).

Prompt Fission Neutron (PFN) uranium logging data are interpreted using calculational models which relate observed data and independently-determined parameters to standard uranium grade values. The observed data are epithermal neutron detector response, which is proportional to uranium grade, and thermal neutron detector response. Both detector responses depend on some of the properties of the earth formation (such as the borehole diameter, the formation water content, and formation bulk density) and on the neutron generator output. The procedure by which grade estimates are made is to postulate model and to calibrate the model against standards, such as the US DOE Fission Neutron Model test pits at Grand Junction, CO, and other locations. The calibration gives a factor which relates the field data logs to the uranium grades reported for the test pits. Different calibration factors may be needed for water-filled boreholes and for air-filled boreholes, but the grade model is designed to accommodate different earth formations or borehole diameters.

21648 (SAND—82-2002C, pp 136-139) **Zetatron tube and transformer technology transfer.** Reichardt, J.W. (Kaman Sciences Corp., Colorado Springs, CO). Jan 1983. NTIS, PC A08/MF A01.

From 2. prompt fussion neutron uranium logging seminar; Albuquerque, NM, USA (19 May 1981).

The purpose of the Zetatron tube and transformer technology transfer was to develop a commercial supplier capable and willing to supply neutron tubes and tube/transformer assemblies to the commercial market. Sandia National Laboratories solicited competitive bids on this activity. Kaman Sciences was awarded the contract and work began during May 1978. The first phase of the contract was to build ten Zetatron tubes, five test transformers and three tube/transformer assemblies. Sandia furnished complete drawing sets, some equipment and technical assistance. Kaman was to procure all piece parts through commercial suppliers, design and fabricate tooling, and develop processes. Design changes were expected to occur during the first phase of the contract. The purpose of the first phase was, therefore, twofold: (1) to implement and prove out the tube and transformer design and (2) to establish Kaman's capability to fabricate tubes, transformers and tube/transformer assemblies. This phase of the contract was completed on September 30, 1979. The second phase of the contract consisted of fabricating ten Zetatron tubes, ten test transformers, and eight tube/transformer assemblies. The purpose of this phase of the work was to prove Kaman's capability to consistently build high quality hardware. This phase of the contract started during February 1980 and was completed during September 1980.

21649 (SAND—82-2002C, pp 140-150) **Life-test results on the Zetatron tube, transformer and the tube-transformer assembly.** Shope, L.A. Jan 1983. NTIS, PC A08/MF A01.

From 2. prompt fussion neutron uranium logging seminar; Albuquerque, NM, USA (19 May 1981).

In the development of the PFN probe it became evident that some considerable life testing of the neutron tube, high-voltage pulse transformer, and the tube-transformer assembly (TTA) were needed to (1) identify life limiting mechanisms, (2) estimate performance degradation, and (3) provide a data base for end-of-life predictions. Initial results had shown clearly that testing monitored by technicians would be much too costly. Consequently, a computer-controlled and monitored test was developed. This paper describes the test, summarizes the records, and discusses the results. Also presented are early results of actual probe life testing now underway.

45 EXPLOSIONS AND EXPLOSIVES

4501 Chemical

REFER ALSO TO CITATION(S) 19763, 21247, 21297

21650 **(LA—9612-MS) Oblique interactions of detonation waves with explosive/metal interfaces.** Walsh, J.M. (Los Alamos National Lab., NM (USA)). Dec 1982. Contract W-7405-ENG-36. 18p. NTIS, PC A02/MF A01. Order Number DE83007119.

The interaction of a detonation wave with an explosive/metal interface is considered. Theoretical models are discussed, and calculated results are given for PBX 9501 onto uranium, tantalum, copper, 304 stainless steel, aluminum, and nickel. For PBX 9501 onto aluminum and copper, regular shock reflection (in the PBX 9501) at small angles changes to regular rarefaction reflection (Prandtl-Meyer flow) at large angles, and the curve of metal-shock pressure vs incidence angle is smooth. For the other metals, there is a discontinuity in shock pressure where low-angle, regular reflection transists to Mach reflection, and a smaller discontinuity where the Mach reflection changes back to high-angle regular reflection.

21651 **(MHSMP—83-03) Corner-turning characteristics of TATB/HMX/Kel-F mixtures.** Stallings, T.L.; Osborn, A.G.; West, G.T. (Mason and Hanger-Silas Mason Co., Inc., Amarillo, TX (USA)). Jan 1983. Contract AC04-76DP00487. 14p. NTIS, PC A02/MF A01. Order Number DE83006931.

A factorial experiment was conducted to determine the effects of HMX content, HMX particle size and TATB particle size in TATB/HMX-Kel-F formulations containing 5% by weight Kel-F 800 binder on corner-turning performance at ambient and -54 C. TATB and HMX particle-size variations did not significantly affect differences in corner-turning performance between the two temperatures. With increasing HMX contents the effect of temperature on corner turning became less and at the maximum HMX content studied, 25%, the corner turning levels were almost equal at ambient and -54 C.

21652 **(MLM-MU—83-62-0001) Tester design concepts for Component Test Facility.** Allison, J.L. (Monsanto Research Corp., Miamisburg, OH (USA). Mound). 15 Feb 1983. Contract AC04-76DP00053. 10p. NTIS, PC A02/MF A01. Order Number DE83007033.

The general tester design concepts for the proposed Component Test Facility cover basic design requirements for the high-speed camera testing areas and the single-point tester area. The three large test cells in this facility will withstand blast effects from ten-pound TNT equivalent detonations. The basic test systems associated with these test cells will be automatic computer control systems capable of analyzing the test data they acquire. A major concern in this design of the test systems is safety for both personnel and equipment. Several factors have been considered and special systems will be built to provide safeguards against accidents. The Component Test Facility was submitted as a 1984 line item; completion is scheduled for the fourth quarter of 1986.

21653 **(UCID—19697) Response of porous beds to rapid gas pressurization.** Weston, A.M.; Lee, E.L. (Lawrence Livermore National Lab., CA (USA)). 14 Feb 1983. Contract W-7405-ENG-48. 28p. NTIS, PC A03/MF A01. Order Number DE83007309.

A two phase, one dimensional, Lagrange hydrodynamic program has been developed to compute the response of a porous bed to rapid gas pressurization. It has been used to investigate plug formation in porous beds, starting with different initial values for density (percent TMD), with different initial sized granulations (particle size), and with different values for material yield (flow) stress. The program is based upon a chain of finite element cells each of which represent the porous media with equations that assume the closure of a spherical pore. Gas flow is then treated with difference equations derived from the differential equations for adiabatic flow with friction in a circular duct. Since the cell definition includes discrete gas volume and gas flow area, the choice of calculational cell size is equivalent to the choice of a unique physical system, i.e., initial density and granulation. Calculational results are compared to data obtained on granulated rocket motor propellants in plastic pipe deflagration to detonation transition (DDT) experiments. These materials are very compliant. Experimental pressurization rates associated with detonation are shown to be of similar magnitude to the calculated pressurization rates that lead to the formation of a forward moving compaction plug. Calculational results are also compared with data from a DDT tube experiment performed on Winchester 231 reloading powder, a much less compliant material. A pressurization rate can be selected for which the calculated compaction front velocity agrees well with the experimentally observed luminous front velocity from the streak camera record. Also, the calculated displacement profiles are in reasonable agreement with experimental displacement profiles observed in x-ray photographs.

21654 **(UCID—19699) Summary of ignition and growth modeling of shock initiation and delayed detonation in full-density and porous propellants.** Tarver, C.M. (Lawrence Livermore National Lab., CA (USA)). 14 Feb 1983. Contract W-7405-ENG-48. 18p. NTIS, PC A02/MF A01. Order Number DE83007405.

The current status of the propellant modeling effort, a physically consistent model of ignition and growth of reaction in full density and porous propellants has been developed that yields good simulations of shock initiation and XDT phenomena in various geometries, but can not as yet satisfactorily explain the shock initiation process that occurs in the porous compaction process in DDT experiments. The limitations of a model extrapolated from shock initiation processes to low pressure and slow compression rate processes have been demonstrated, and a more complete description of the processes involved in DDT will have to be developed to accurately model the piston compaction experiment. Some of these planned additions to extensions of the current model are discussed in the Future Plans section.

21655 **(UCID—19726) I.R. emission measurements of shocked rocket propellants by time-resolved infrared radiometry.** Von Holle, W.G. (Lawrence Livermore National Lab., CA (USA)). 14 Feb 1983. Contract W-7405-ENG-48. 22p. NTIS, PC A02/MF A01. Order Number DE83007356.

This report is a summary of the results of the application of time-resolved radiometry to the study of SDT in VRP, VOY, FKM and ALTU-16. Some of the data have been previously reported. An attempt is made to integrate and correlate all the data in order to arrive at conclusions about the effect of the composition of these propellants on their response to shock stimulus. These propellants were chosen to represent extremes of sensitivity and composition. After a brief description of the gun experiments, the bare propellants results are discussed, followed by KCl overlay experiments. Finally, shredded VRO-2B gun-impact experiments which were done to elucidate the nature of the reactions occurring in porous systems, important for understanding DDT and XDT, are described. Results of infrared radiometry experiments have provided time-resolved temperature and fraction reacted data for a series of shocked propellants with different composition. Results on free surfaces demonstrated the heterogeneity of shock-induced reaction and indicated a wide range of responses. VOY and FKM were found to be highly reactive; VRP and ALTU-16 almost inert. KCl crystal confined experiments allowed the heterogeneity of the shock induced reaction to be confirmed, and the evolution of reaction under pressure was compared to 9404. Confinement smooths the differences between propellants, but VOY remains the standout from the rest.The ordering of shock induced reactivity follows the ordering of calculated HEX and flame temperatures. The KCl experiments show a large early pressure-dependent change in reaction rate which is inconsistent with manganin gauge pressure measurements. The most likely explanation seems to be a rapid binder decomposition reaction, which is highly pressure dependent and which would lead to large pressure increases at longer run distances than available in these experiments.

21656 **(UCRL—88532) Computer simulation of concrete penetration by shaped-charge jets.** Murphy, M.J.; Henderson, J.M. (Lawrence Livermore National Lab., CA (USA); California Univ., Davis (USA). Dept. of Mechanical Engineering). 7 Jan 1983. Contract W-7405-ENG-48. 12p. (CONF-830417—1). NTIS, PC A02/MF A01. Order Number DE83007359.

From 7. international symposium on ballistics; Hague, Netherlands (19 Apr 1983).

A unified analytical approach to the solution of the shaped-charge penetration in concrete problem has been developed and is presented. The analytical model is correlated to three types of experiments that study the shaped-charge jet-formation process and resulting penetration phenomena. Hydrodynamic finite-element analysis of the explosive detonation, liner collapse, and jet-formation process is compared to a flash x-ray experiment. Analytical predictions of the penetration-time history are compared to experiments where the penetration-time history is monitored. These experiments provide for a determination of the minimum jet velocity for penetration as a function of standoff. Finally, computer predictions of total penetration and hole profile are compared to experiments. These correlations provide for a determination of the jet energy/target hole volume constant for concrete. The method developed is shown to be valid for a broad range of shaped-charge designs in concrete targets. Preliminary investigations with other target materials show the method can be extended to predict penetration for generalized shaped-charge designs into any target as long as some basic target-material properties are known.

21657 **(AD—244784/5) Shock, vibration and associated environments. Part III.** (Office of the Secretary of Defense (Research and Engineering), Washington, DC (USA)). Sep 1960. 322p. (BULL—28-PT-3). NTIS, PC A14/MF A01.

No abstract available.

21658 **(AD-A—115482/2) Strategic targeting of light water reactors. Master's thesis.** Domaszek, G.R. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Mar 1982. 96p. (AFIT/GNE/PH—82M-7). NTIS, PC A05/MF A01.

The value of light water reactors as strategic nuclear targets for enhancing fallout is evaluated in this report. The evaluation is made by determining the ratio of the probability weighted fallout coverage from one or more weapons which involve the reactor core, to the fallout coverage from a single weapon weighted by the number of weapons targeted. This ratio is the factor by which targeting reactors will enhance the area of fallout coverage. Targeting reactors with a single weapon will always enhance fallout coverage. However, the probabilistic amount of coverage increase is dependent on weapon CEP. Area coverage of a particular dose during the first week is increased by less than 5 percent for CEPs greater than 350, 400, and 500 meters corresponding to yields of 100, 500, and 1000 kilotons, respectively. During the first year, the area is increased by less than 5 percent for CEPs greater than 900, 1100, and 1400 meters corresponding to yields of 100, 500, and 1000 kilotons, respectively. Finally, multiple weapon targeting of nuclear reactors in counter-productive in that is decreases the factor by which targeting reactors increases fallout area coverage.

21659 **(AD-A—115986/2) Standing waves and notches in a parallel-plate type of EMP simulator and their reduction. Final report.** Wu, T.T.; King, R.W.P.; Blejer, D.J.; Owens, M. (Mission Research Corp., Albuquerque, NM (USA)). Mar 1981. 43p. NTIS, PC A03/MF A01.

The high standing-wave ratio (SWR) in a model simulator in the mid-frequency range defined by kh = 2 pi h/delta approx. = 2 pi (where h is the height of the parallel-plate region) is investigated experimentally. It is shown that the isolated deep minimum or notch is due to the mutual cancellation of the imaginary parts of the TM01 and TEM modes. The effects on the SWR and the deep minimum of changes in the magnitude and location of the termination resistance are investigated. Also studied are the introduction of a bifurcating plate, resistive modal filters, and series aprons. It is shown that with the proper adjustment of the last named, the notch can be eliminated and the SWR reduced to near two at discrete frequencies that span the entire mid-frequency range. Since the low-frequency ranges already have low SWRs, the simulator has been made effective over the entire frequency band in the sense that the SWR is low.

21660 **(AD-A—117958/9) Assessment of combined effects of blast and fire on personnel survivability. Final report 3 Apr 7-31 Jan 81.** Longinow, A.; Waterman, T.E.; Takata, A.N. (IIT Research Inst., Chicago, IL (USA)). Jun 1982. 178p. NTIS, PC A09/MF A01.

The objective of the study described was (1) to perform a preliminary analysis of hazards to sheltered personnel in a blast-fire environment produced by the detonation of a 1 MT nuclear weapon near the ground surface, and (2) to lay the basic ground work for developing a consistent, formal methodology for estimating the probability of people survival in a blast-fire environment.

21661 **(AD-A—118240/1) Soviet post-strike civil defense rescue, damage-limiting, repair and restoration operations. Final report 13 aug 81-12 aug 82.** Goure, L. (Science Applications, Inc., McLean, VA (USA)). Aug 1982. 193p. NTIS, PC A09/MF A01.

This report describes and analyzes, on the basis of open Soviet source material, Soviet civil defense concepts, organization, priorities, operational plans and capabilities pertaining to post-strike rescue, damage-limiting, emergency repair and restoration operations in centers of nuclear destruction. Soviet sources indicate that a great deal of importance is attributed to post-strike operations and that the overwhelming majority of civilian and military civil defense forces of over some 20 million are assigned to this mission.

21662 **(AD-A—118342/5) Nuclear weapons effects mitigation techniques.** Uyesugi, D.F. (Army Nuclear and Chemical Agency, Springfield, VA (USA)). Jun 1982. 47p. NTIS, PC A03/MF A01.

In order to fight and win on the AirLand battlefield, the US must be able to employ nuclear weapons decisively, and continue to fight effectively after enemy employment. Survival of personnel and equipment and recovery from injury or damage are essential to continued operations in the nuclear environment. Accordingly, the specific vulnerabilities of personnel and equipment must be understood and measures taken to lessen or minimize the impact of potential nuclear weapons effects. In recognition of this need, USANCA intends to publish several Nuclear Notes addressing a wide range of weapons effects mitigation techniques. Basic mitigation techniques for nuclear weapons blast, thermal, ionizing radiation, and electromagnetic pulse (EMP) effects will be summarized, and the payoffs associated with employment of each or a combination of techniques will be discussed.

21663 **(AD-A—118396/1) Physical security modeling for the shipboard nuclear weapons security program.** Jacques, E.G.; Bartusek, D.L.; Monroe, R.W.; Schwartz, M.S. (Naval Surface Weapons Center, Silver Spring, MD (USA)). 1 Apr 1982. 74p. NTIS, PC A04/MF A01.

A modeling methodology in support of the Shipboard Nuclear Weapons Security program was needed in order to allow a trade-off of various candidate security systems. This document details the factors that lead to the modeling approach currently being used. In addition a brief description of the models along with examples is presented. The models were chosen for their ability to analyze the spectrum of potential threats pertaining to the operational conditions of a variety of ship classes.

21664 **(AD-A—118456/3) Mass fire model concept. Final report 8 Sep 80-31 May 81.** Sanderlin, J.C.; Ball, J.A.; Johanson, G.A. (Mission Research Corp., Santa Barbara, CA (USA)). 31 May 1981. 330p. NTIS, PC A15/MF A01.

Review of the literature pertaining to mass fire onset and development indicates there exist no models that describe the onset and development of mass fires. The state-of-the-art is such that a low confidence level, parametric model can be developed. The theoretical basis, and a preliminary implementation, are described for a low confidence level, parametric model of mass fire onset and development in an urban environment.

21665 **(AD-A—120061/7) Analytic research on strategic, tactical and doctrinal military concepts: the concept of stability. Final report 1 May-19 Dec 79.** Hammerman, G. (Dupuy (T.N.) Associates, Inc., Dunn Loring, VA (USA)). 3 Oct 1980. 136p. NTIS, PC A07/MF A01.

This report distinguishes between international political stability and strategic nuclear stability, providing a concise history of each concept. It then defines the following subcategories of strategic nuclear stability: deterrence stability, crisis stability, arms race stability, and escalation stability. The development of what is termed orthodox nuclear strategic doctrine, which holds that stability depends upon both nuclear superpowers' having invulnerable retaliatory forces and vulnerable societies, is traced from its beginnings about 1960 to the present. The role of stability, in the 1960s and 1970s, as the key link between arms control policy and weapons acquisition policy is identified and discussed. Alternative approaches to stability, including Soviet views, are summarized. An extensive, fully annotated bibliography is included.

21666 **(DOE/EV/03161—2) Mortality follow-up of Shirabe 1945 Nagasaki questionnaire sample, 1945-1966.** Tachikawa, K. (Radiation Effects Research Foundation, Hiroshima (Japan); National Inst. of Health, Hiroshima (Japan)). 1 Jul 1971. Contract AC01-76EV03161. 22p. (In English and Japanese). NTIS, PC A02/MF A01. Order Number DE83007697.

The November 1945 questionnaire survey by Dr. Raisuke Shirabe, professor of surgery at Nagasaki University Medical School, provides a means of investigating the mortality of Nagasaki A-bomb survivors during the period 1945-1950, which is excluded from the JNIH-ABCC Life Span Study. The roster of about 5500 alive on the survey date included, on investigation, 4208 who had their honeski in Nagasaki on that date. Their deaths were ascertained by checking against the koseki. Since the sample is small, no significant relationship to A-bomb exposure distance is noted, though a trend is presented toward more deaths observed than expected in the proximally exposed.

21667 **(DOE/EV/03161—T1) Mortality among atomic bomb survivors, October 1945-September 1964. ABCC Technical Report 6-69.** Tachikawa, K.; Kato, H. (Radiation Effects Research Foundation, Hiroshima (Japan); National Inst. of Health, Hiroshima (Japan)). 24 Apr 1969. Contract AC01-76EV03161. 30p. (In English and Japanese). NTIS, PC A03/MF A01. Order Number DE83007691.

A casualty survey was conducted on 10 August 1946 in Hiroshima City and a total of 103,991 persons were enumerated on survey sheets within the city limits of Hiroshima. The mortality of these persons was investigated for the 19 years from October 1945 to September 1964 by the following three periods October 1945-September 1946; October 1946-September 1950; and October 1950-September 1964. There was an excess of mortality in the proximally exposed during the period October 1945-September 1946, as might be expected. The excess of mortality in the proximally exposed was still observed for the succeeding 4 years, October 1946-September 1950. There was an excess of mortality from leukemia and anemia in the proximaally exposed for this period. For the period October 1950-September 1964, there was an excess of mortality in the proximally exposed. The excess of mortality was observed for the first 4-year period (1950-1954) and was not observed for the next 4 years and again became significant in the last 4 years 1958-1962. In general, the findings observed for this period are similar to the findings previously observed on the Life Span Study sample.

21668 **(LA-UR—83-198) Source terms for the initial radiations.** Whalen, P.P. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 42p. (CONF-830209—2). NTIS, PC A03/MF A01. Order Number DE83007574.

From US/Japan joint workshop on the reassessment of A-bomb radiation dosimetry in Hiroshima and Nagasaki; Nagasaki, Japan (16 Feb 1983).

Calculations are provided of the prompt neutron and gamma-ray outputs of the Hiroshima and Nagasaki bombs and calibration data provided to support these calculations. Estimates with uncertainties of the yields of the Hiroshima and Nagasaki explosions are also presented. Calibration data for the Nagasaki bomb output calculation consists of the calculated outputs of several other test nuclear devices of the Nagasaki type for which dose measurements were obtained in test explosions. Calibration data for the Hiroshima bomb output calculation consists of spectral measurements of the neutron and gamma-ray outputs of a replica of the Hiroshima bomb operated as a critical assembly. The output spectra were calculated with classified special purpose computer codes which follow the evolution of the explosions. (ACR)

21669 (UCID—19419) Blast attenuation in a shot tunnel using water jets. Glenn, L.A.; Young, D.A. (Lawrence Livermore National Lab., CA (USA)). 2 Jul 1982. Contract W-7405-ENG-48. 45p. NTIS, PC A03/MF A01. Order Number DE82018508.

A quasi-one-dimensional method was devised for calculating transient, compressible, viscous flow through a complex array of tubes or jets with which mass, momentum and energy are exchanged. The method was applied to study the impulsive crossflow of a blast-wave-induced plasma through an annular array of water jets, positioned at a stand-off distance from the walls of a shot tunnel. The peak pressure and temperature near the wall can be reduced, in this way, by an order of magnitude or more.

21670 (UCRL—15508) Fire and the related effects of nuclear explosions. 1982 Asilomar Conference. Martin, S.B.; Alger, R.S. (eds.). (SRI International, Menlo Park, CA (USA)). Nov 1982. Contract W-7405-ENG-48. 133p. (CONF-8204106—Summ.). NTIS, PC A07/MF A01. Order Number DE83006568.

From 5. Federal Emergency Management Agency conference on fire and the related effects of nuclear explosions; Asilomar, CA, USA (25 Apr 1982).

This report summarizes the proceedings of a Federal Emergency Management Agency-sponsored Conference on fire and the related effects of nuclear explosions (with passing attention to earthquakes and other nonnuclear mishaps). This conference, the fifth of an annual series (formally called Blast/Fire Interaction Conferences), was held during the week of April 25, 1982, again at Asilomar, California.

21671 Air-over-ground calculations of the neutron, prompt, and secondary gamma free-in-air tissue kerma from the Hiroshima and Nagaski devices. Pace, J.V. III; Bartine, D.E.; Knight, J.R. (Oak Ridge National Laboratory, Oak Ridge, TN 37830). *Transactions of the American Nuclear Society;* 41: 471-472(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

21672 Source spectra calculations. Whalen, P.P.; Kammerdiener, J.; Streetman, R. (Los Alamos National Laboratory, P.O. Box 1663, Los Alamos, NM 87545). *Transactions of the American Nuclear Society;* **41**: 470-471(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

4503 Explosion Detection

21673 (AD-A—116048/0) A statistical discrimination experiment for eurasian events using a twenty-seven-station network. Technical report. Rivers, D.W.; von Seggern, D.H.; Elkins, B.L.; Sproules, H.S. (Teledyne Geotech, Alexandria, VA (USA). Seismic Data Lab.). 8 Jul 1980. 191p. NTIS, PC A09/MF A01.

An experiment was performed to test the effectiveness of a multivariate method of analysis for distinguishing earthquakes from explosions. The data base for the experiment consisted of digital recordings made at twenty-seven stations, including four large arrays, of one hundred thirty-three Eurasian events. Spectral magnitudes were measured in three frequency bands of the six phases P, Lg, long-period P, long-period S, LR, and LQ. Complexities of the P-waves were measured in three time windows, and corner frequencies and low-frequency spectral levels were computed for the P-wave spectra. When signals could not be detected, spectral magnitudes were measured of noise samples, and these were taken to be detection thresholds. Signal magnitudes and detection thresholds from all the stations were used to find maximum-likelihood estimates of the spectral magnitudes for each event. On account of gaps in the data, many different combinations of different numbers of variables were used in the classification of the one hundred thirty-three events. The variables which were applicable to the most events were short-period P-wave spectral ratios. The most effective discriminants were spectral ratios of Love waves to P waves.

In this report are given climatological data measured at CRN Trisaia during the year 1979. Data are shown as tables or plots and represent the output of a program written for the circumstance.

21679 (CONF-820810—16) **Mathematical modeling of cooling-tower plumes.** Carhart, R.; Policastro, A. (Illinois Univ., Chicago (USA). Dept. of Physics; Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01. Order Number DE83008681.

From 10. international mathematics and computers simulation congress on systems simulation and scientific computation; Montreal, Canada (9 Aug 1982).

The vast majority of mathematical models used to predict plume rise from natural-draft (NDCT) and mechanical-draft (MDCT) cooling towers employ the integral approach. The following significant areas of controversy exist in the theoretical development of such models: assumptions needed to assure the proper balance between buoyancy and momentum transfer mechanisms; treatment of tower downwash; treatment of thermodynamics; treatment of atmospheric diffusion; and proper method for merging of plumes. The most successful models employ assumptions which appear physically reasonable with calibration of unknown coefficients with field and/or laboratory data. Such models are capable of predicting visible plume rise within a factor of 2 and visible plume length within a factor of 2.5 for 50 to 75% of most new field cases. Such accuracy is sufficient for most design and environmental impact evaluations. Only the ANL and KUMULUS Models of this better-performing group are sufficiently general, however, to handle any configuration of NDCTs and MDCTs.

21680 (CONF-820970—, pp III.3-III.139) **Simulating CO_2-induced climatic change with mathematical climate models: capabilities, limitations and prospects.** Schlesinger, M.E. (Oregon State Univ., Corvallis). Feb 1983. NTIS, PC A23/MF A01.

From Carbon dioxide research conference: carbon dioxide, science and consensus; Berkeley Springs, WV, USA (19 Sep 1982).

Possible climatic changes induced by increased CO_2 levels are considered with a focus on the use of mathematical models of the earth's climate system. The characteristics of three different types of mathematical climate model are described with an emphasis on the general circulation model (GCM). Two types of simulation of the CO_2-induced climatic changes are described and attention is focused on the equilibrium simulations of eight GCMs for both doubled and quadrupled CO_2 concentrations. The geographical distributions of the CO_2-induced changes in the precipitation rate and soil moisture that have been simulated by the GCMs are compared, as are the corresponding zonal- and global-mean quantities.

21681 (LBL—13500-Exc., pp 4.5-4.7) **Aqueous reactions of nitrite with bisulfite ions in sulfate aerosol formation.** Oblath, S.B.; Chang, S.G.; Markowitz, S.S.; Novakov, T. Sep 1982. NTIS, PC A02/MF A01. Contract AC03-76SF00098.

In Atmospheric aerosol research. Excerpt from the Energy and Environment Division annual report, FY 1981, Chapter 4.

Possible reactions of hydroxylamine disulfonate and manosulfanates with nitrite ions were studied in the broader context of atmospheric chemistry role of nitrogen oxides in the formation of sulfate aerosols. (PSB)

21682 (N—82-18238) **Investigation on atmospheric h and d through the measurement of their lyman-alpha emissions.** Bertaux, J.L. (Centre National de la Recherche Scientifique, 75 - Paris (France)). Nov 1981. 3p. NTIS, PC A08/MF A01.

In NASA Marshall Space Flight Center Spacelab Mission 1 Expt. Descriptions 3 p (SEE N82-18234 09-12).

Study of sources of Lyman-alpha emission in the atmosphere, in the interplanetary medium, and perhaps in the galactic medium is planned. Sources of Lyman-alpha emission are described and a schematic of the instrument presented.

21683 (NP—3901017) **Contribution to the measurement of water wave induced infra-sound waves in Hamburg and their relation with microseismic waves and with the atmospheric propagation conditions.** Linde, B. (Hamburg Univ. (Germany, F.R.). Fachbereich Geowissenschaften). 4 Jun 1978. 169p. (In German). NTIS (US Sales Only), PC A08/MF A01. Order Number DE83901017.

In this study water wave induced infra-sound waves have been measured, and the results of these measurements are related with the excitation of infra-sound waves and the atmospheric propagation conditions. In addition the results are compared with microseismic waves. Investigations of this kind are performed to obtain a better insight in the layer structure of the atmosphere as well as in the production and propagation mechanisms of infrasound. The propagation of infra sound has been studied by the ray tracing method, taking into account the temperature and velocity distribution in the atmosphere. A strong directional dependence of the propagation is obtained in a model which includes the wind velocity distribution.

21684 (PNL-SA—10634) **Observations of drainage winds on a simple slope.** Doran, J.C.; Horst, T.W. (Pacific Northwest Lab., Richland, WA (USA)). Nov 1982. Contract AC06-76RL01830. 4p. (CONF-830307—12). NTIS, PC A02/MF A01. Order Number DE83007851.

From 6. American Meteorological Society symposium on turbulence and diffusion; Boston, MA, USA (22 Mar 1983).

Katabatic winds observed over a simple slope showed progressive deepening and strengthening with increased downslope distance. The maximum in the downslope wind component increases, and the height of the maximum rises as the flow develops. A measure of the flow depths obtained from the temperature profiles at the Rattlesnake Mountain site near Richland, Washington and the Cobb Mountain site in northern California shows that these depths are insensitive to the details of the ambient conditions, provided the drainage flows are well established. Depths of the katabatically driven winds appeared to be more sensitive to ambient wind directions.

21685 (UCRL—86266) **Explicit particle-dynamics model for granular materials.** Walton, O.R. (Lawrence Livermore National Lab., CA (USA)). May 1982. Contract W-7405-ENG-48. 9p. (CONF-8205151—1). NTIS, PC A02/MF A01. Order Number DE83006411.

From 4. international conference on numerical methods in geomechanics; Edmonton, Canada (31 May 1982).

Discrete-particle simulation of granular-material motion is developing into a viable method for studying how various interparticulate forces affect the bulk behavior of granular solids. A two-dimensional, polygonal-particle computer model, developed from the ideas of Cundall (1976), and incorporating other techniques from molecular dynamics, is being used in a study of the flow behavior of rubblized oil shale. Direct comparison with physical tests involving multiblock systems have verified the model's ability to predict the motion of real materials. Computer generated movies and high-speed motion pictures of physical tests involving gravity flow of 2-dimensional polygonal particles show formation of temporary arches followed by dynamic rupture and reformation of new arches. Direct shear tests on oil-shale rubble involving very large displacements indicate significant circulatory motion in the rubble. Computer simulation of the direct shear tests show similar behavior.

21686 **Experimental studies of ion clustering: relationship to aerosol formation processes and some atmospheric implications.** Castleman, A.W. Jr. *Journal of Aerosol Science;* 13: No. 1, 73-85(1982). Contract AC02-78EV04776.

Studies of the clustering of molecules about ions are of both fundamental and practical interest. The results find immediate application in assessing the validity of classical expressions for nucleation phenomenon and provide a basis for further developments of nucleation theory. It is well known that the atmosphere contains substantial ion populations and their potential role in aerosol formation provides a strong coupling between the fields of atmospheric electricity and other areas of the atmospheric sciences. As a result of recent advances in high pressure mass spectrometry, the detailed processes involved in the continuous transition of a system from the gaseous to the condensed (aerosol) state can be investigated at the molecular level. Many of the recent findings in ion clustering are reported in literature devoted to fundamental chemistry and physics and are not in a form of immediate value to the researcher in the field of aerosol science. The purpose of this paper is to review recent progress in understanding ion clustering as it relates to the general mechanisms of gas-to-particle conversion. Laboratory data on the bonding of various negative and positive ion complexes are used to assess the validity of the classical model to ion induced nucleation. Further consideration is given to the role of ion cluster-ion cluster interaction in aerosol formation.

21687 Combination of a screen-diffusion-battery with a single-stage impactor for size selective aerosol sampling. Niessner, R.; Klockow, D.; Fissan, H.; Kapitza, F. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

In the present paper a sampling method for size related chemical analysis is described which collects particles above 0.7 μm by impaction and separates submicron particles into two fractions by diffusion. The method has been used to investigate the content in sulfate, nitrate and chloride of the three modes of atmospheric aerosol.

5002 Chemicals Monitoring And Transport

21688 (AD-A—115443/4) Remote sensing of turbine engine gases. Final report 1 Oct 80-30 Sep 81. Killinger, D.K.; Menyuk, N.; Mooradian, A. (Massachusetts Inst. of Tech., Lexington (USA). Lincoln Lab.). 30 Sep 1981. 81p. NTIS, PC A05/MF A01.

This is the FY 81 final report on the program entitled 'Remote Sensing of Turbine Engine Gases'. The specific tasks which were conducted during FY 81 consisted of the following: (1) the feasibility demonstration of a dual-laser differential-absorption LIDAR(DIAL) system for the remote sensing of CO, NO, and C2H4, (2) the development of a data acquisition and processing system for the dual-laser DIAL system, (3) the laser remote sensing of CO and C2H4 in the exhaust of a stationary jet aircraft, and (4) the laser remote sensing of hydrazine, monomethylhydrazine (MMH), and unsymmetrical dimethylhydrazine (UDMH).

21689 (BNL—32339) Data-acquisition system for environmental monitoring aboard a twin-engined aircraft. Tichler, J.; Bernstein, H.; Brown, R.M.; Daum, P. (Brookhaven National Lab., Upton, NY (USA)). 1983. Contract AC02-76CH00016. 5p. (CONF-830412—1). NTIS, PC A02/MF A01. Order Number DE83005793.

From 5. symposium on meteorological observations and instrumentation; Toronto, Canada (11 Apr 1983).

A number of experimental platforms have been used in support of the Multistate Atmospheric Power Production Study (MAP3S) and the Coastal Meteorology programs at Brookhaven National Laboratory. These platforms include a twin-engine Britten Norman Islander aircraft, a motorized van, a variety of boats and temporary enclosures set up in the field. Each platform carried a data logger consisting of a multiplexer, an analog to digital (A/D) converter and a four track endless loop magnetic tape for data storage. In recent years it has become increasingly evident that the data loggers in use were no longer adequate. Since the aircraft provided the most constraints on the data acquisition system as well as being the most important research platform, a data system was designed for that platform with the secondary goal that the system would serve as a prototype for systems to be used on other platforms.

21690 (CONF-810808—12) Acidic deposition: review of current knowledge. Knudson, D.A. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 12p. NTIS, PC A02/MF A01. Order Number DE83007403.

From Energy in the man-built environment: the next decade specialty conference; Vail, CO, USA (3 Aug 1981).

Events in Europe which led to the introduction of the concern for acidic deposition in eastern North America are reviewed. Some of the early conclusions regarding the existence of a trend and the extent of the phenomenon are reexamined. These reexaminations indicate that the definition of a precipitation acidity trend is questionable. Also, it was verified that any explanation of the variability of precipitation acidity must consider such factors as drought and farming and forest management activities. The chemical constituents contributing most to precipitation acidity are reviewed as an indication of primary sources. Sulfate is the primary contributor in the Northeast (60 to 70%). The contribution due to nitrates in this region increased from about 22% in the mid-1950s to about 30% in 1973. However, in other regions deposition acidity may be attributable to a much different combination of chemical species, and may even be dominated by an acidic constituent other than sulfate or nitrate. Several individual processes involved in the transport and transformation of precursor pollutants from source to receptor were briefly reviewed. These processes included mechanisms for the transformation of SO_2 and NO/sub x/ emissions into sulfates and nitrates, specific meteorological conditions conducive to long-range transport, major source identification, and the incorporation of this information into mathematical models to predict acidic deposition amounts and patterns. Although the information presented does not explore ecery facet of each process, it does address important governing features and allows for an appreciation of the complexity of quantifying the complete process through use of mathematical models.

21691 (CONF-820627—12) Model for fabric-filter cleaning: single-element and multiple-compartment effects. Farber, P.; Theodore, L.; Reynolds, J. (Argonne National Lab., IL (USA); Manhattan Coll., New York (USA). Dept. of Chemical Engineering). Jun 1982. Contract W-31-109-ENG-38. 22p. NTIS, PC A02/MF A01. Order Number DE83007632.

From 75. annual meeting on the Air Pollution Control Association; New Orleans, LA, USA (20 Jun 1982).

A model for fractional removal in a fabric filter was applied to filtration systems. A method for allowing for the effect of imperfect cleaning of an element or compartment was developed; it was shown that this must be taken into account when modeling a system. Relations for superficial velocity through a dust-cake layer, as well as the buildup of this layer during filtration when cleaning is imperfect, were shown. Finally, the tools necessary for modeling a multicompartment system are described, and the reasons for changes in penetration when a compartment is taken out of service for cleaning are given. Increases in outlet grain loading can be explained as being due to the removal of the compartment with the highest efficiency, the subsequent increase in gas flow through the other compartments, and the return to filtration by a cleaned compartment with relatively high penetration.

21692 (CONF-820970—) Carbon dioxide research conference: carbon dioxide, science and consensus. (Oak Ridge Associated Universities, Inc., Washington, DC (USA). Inst. for Energy Analysis). Feb 1983. Contract AC05-76OR00033. 539p. NTIS, PC A23/MF A01. Order Number DE83007182.

From Carbon dioxide research conference: carbon dioxide, science and consensus; Berkeley Springs, WV, USA (19 Sep 1982).

The DOE program focuses on three areas each of which requires more research before the many CO_2-related questions can be answered. These areas include the global carbon cycle, climate effects, and vegetation effects. Additional information is needed to understand the sources and sinks of CO_2. Research efforts include an attempt to estimate regional and global changes in temperature and precipitation. Increased atmospheric CO_2 may be a potential benefit to vegetation and crops because it is an essential element required for plant growth. Eight separate papers are included. (PSB)

21693 (CONF-820970—, pp II.3-II.62) **Global carbon cycle: what we know and could know from atmospheric, biospheric, and oceanic observations.** Keeling, C.D. (Scripps Institution of Oceanography, La Jolla, CA). Feb 1983. NTIS, PC A23/MF A01.

From Carbon dioxide research conference: carbon dioxide, science and consensus; Berkeley Springs, WV, USA (19 Sep 1982).

This paper discusses the global carbon cycle in terms of quantitative relationships between empirical observations of the atmosphere, oceans and biosphere. Since my own studies have focused on the atmosphere and near surface ocean waters, I will develop the topic with emphasis on the atmospheric carbon cycle and air-sea interactions. Respondents are invited to fill in gaps in the presentation, especially with regard to the land biosphere. The marine biosphere will be regarded as part of the oceans, discussed only indirectly.

21694 (CONF-820970—, pp II.91-II.122) **Transient tracers in the ocean North Atlantic study: a progress report.** Brewer, P.G. (National Science Foundation, Washington, DC). Feb 1983. NTIS, PC A23/MF A01.

From Carbon dioxide research conference: carbon dioxide, science and consensus; Berkeley Springs, WV, USA (19 Sep 1982).

The TTO (Transient Tracers in the Ocean) study in the North Atlantic in 1981 was a major experiment carried out by a group of chemical and physical oceanographers to investigate the manner and time scale of ocean mixing, as deduced from the distribution of radiochemical tracers injected into the atmosphere, and thence the ocean, in the period 1958-1962 from nuclear bomb tests. These observations, coupled with careful investigation of oceanic CO_2 properties, provide unique constraints on ocean uptake of fossil fuel CO_2 and are reviewed.

21695 (CONF-821169—1) **Experimental evaluation of NO/sub x/ control using a glass tank simulator.** Abbasi, H.A.; Khinkis, M.J.; Waibel, R.T.; Boyd, W.D. (Institute of Gas Technology, Chicago, IL (USA); Southern California Gas Co., Los Angeles (USA)). 1982. 46p. Inst. of Gas Tech., 3424 South State Street-IIT Center, Chicago, IL 60616.

From 43. glass problems conference; Columbus, OH, USA (10 Nov 1982).

This paper discusses the results of tests conducted on a 1/4-scale glass melter firing port to determine the effects of various burner operating parameters on NO/sub x/ mission levels. The burner port was designed for a firing rate of 3 million Btu/hr in consultation with a container glass manufacturer and was tested on a pilot-scale furnace. The furnace was operated at temperatures generally found in glass melters (2600° to 2850°F). The furnace temperature was adjusted using water-cooling tubes as a load. We investigated combustion air preheat temperature (1600°F to 2200°F), air/fuel ratio (fuel rich to 8% excess oxygen), fuel injection velocity, turndown, and flue-gas recirculation (5% and 10%) and furnace wall temperature. NO/sub x/ levels decreased significantly with decreasing combustion air preheat temperature, decreasing furnace refractory temperature, and decreasing excess oxygen levels below 5% to 6%. Above 5% to 6% oxygen, the NO/sub x/ levels decreased with increasing oxygen levels. Though not as significant, NO/sub x/ levels were also reduced by varying degrees at reduced firing rate, reduced fuel injection velocity, and with flue-gas recirculation.

21696 (CONF-830216—2) **Interactive effects of acid rain and gaseous air pollutants on natural terrestrial vegetation.** McLaughlin, S.B.; Baes, C.F. III; McConathy, R.K.; Sigal, L.L.; Walker, R.F. (Oak Ridge National Lab., TN (USA)). 1983. Contract W-7405-ENG-26. 12p. NTIS, PC A02/MF A01. Order Number DE83007507.

From Acid rain program review meeting; Raleigh, NC, USA (21 Feb 1983).

Results of the multielemental analysis of tree rings have indicated that accumulation patterns of trace elements differ widely between elements and between tree species. Many elements show patterns of increasing concentration in recent tissues with some elements such as zinc and chromium showing steady increases (in the Oak Ridge, Tennessee area) over the past 30 years. Highest levels of aluminum, zinc, copper, and chromium occur in most recent tissues of shortleaf pine and are at levels of potential concern for adverse effects to metabolically active tissues.

21697 (CONF-8204111—1) **Hydroscopic and hydrate water in aerosols and their effect on fine-particle mass and on atmospheric extinction.** Rote, D.M. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 24p. NTIS, PC A02/MF A01. Order Number DE83007672.

From Workshop on hygroscopic aerosols in the planetary boundary layer; Vail, CO, USA (13 Apr 1982).

Regression analyses of a large body of fine-particle mass (FP mass) and fine-particle sulfate ion ($FPSO_4$/sup =/) concentration data have shown that for a regression equation of the form, chi/sub FPmass/ = a + b.Chi/sub $FPSO_4$/sup =/, the slope (b) ranges from 1.8 to 2.53 depending on the time of year. Values of r^2 obtained from these regression fits ranged from 0.79 to 0.84. The regression line slope is of special interest because it measures the ratio of that portion of the fine particle mass that is correlated with the sulfate ions to the mass of the sulfate ions. A simple model of a fine particle atmospheric aerosol containing a mixture of sulfuric acid, ammonium bisulfate, and ammonium sulfate with a ratio of ammonium ions to SO_4/sup =/ of about 1.25 would lead to a ratio of total sulfate mass to SO_4/sup =/ mass of about 1.24. Comparing this ratio with the ratio of that portion of the FP mass that is correlated with the sulfate ions to the mass of the SO_4/sup =/ shows a considerable discrepancy. The question therefore arises as to how to account for the numerical range of 1.8 to 2.53 of the mass ratio obtained from the regression analyses. By invoking some plausible assumptions regarding mixtures including both hygroscopic water and hydrated states of sulfate compounds, a model is hypothesized that is able to account for mass ratio of about 1.64 +- 0.33. An additional hypothesis is invoked to explain the occurrence of higher mass ratios. The results of this aerosol model were combined with a long-range transport sulfate model and a visual range algorithm to predict visual ranges over eastern United States for various relative humidities. Numerical results are presented.

21698 (DOE/EP/12079—T4) **Finalization of reports entitled Updated Acid Rain Information Book and Simplification Approaches to Protecting PSD Class I Areas.** (GCA Corp., Bedford, MA (USA). GCA Technology Div.). 15 Mar 1983. Contract AC01-82EP12079. 10p. NTIS, PC A02/MF A01. Order Number DE83008771.

GCA/Technology Division has submitted several draft final reports to DOE's Environmental Issues Division (EID), including the Updated Acid Rain Information Book, and Simplified Approaches to Protecting PSD Class I Areas. The work of this task consists of revising these draft final reports incorporating the comments received as a result of DOE's participation in the Interagency Task Force on Acid Rain. A schedule of work, the project organization chart, and cost estimates are included.

21699 (DOE/METC—83-51) **Particulate sampling and characterization. Extractive sampling in situ characterization available instrumentation.** (Department of Energy, Morgantown, WV (USA). Morgantown Energy Technology Center). 1981. 404p. (CONF-8106270—). NTIS, PC A18/MF A01. Order Number DE83005672.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

The first part of these proceedings deals with particulate sampling under high temperature and high pressure conditions and the measurement of the particle size distribution. The second part deals with sample dilution, turbulent pipe flow, resolution of particle sizing instruments, and fine particle behavior and characterization. The third part describes the instrumentation available for particulate sampling in stacks or ducts, a particle size impactor for heavily loaded gas streams, and several instruments for on-line monitoring and sizing of particulates. Separate abstracts were prepared for most of the papers presented at this meeting. (CKK)

21700 (DOE/METC—83-51, pp 17-28) **Dust sampling at high temperature and pressure.** Markoja, R.L.; Shackleton, M.A. (Acurex Corp., Mountain View, CA). 1981. NTIS, PC A18/MF A01.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

One critical problem requiring solution in developing fossil energy processes is particulate removal at high temperature and pressure. To evaluate performance of hot gas cleaning devices, it has been necessary to develop particle sampling equipment for use under the temperature and pressure extremes encountered. Acurex Corp. has developed particle sampling equipment for a number of difficult environments, including the experimental pressurized fluidized bed combustor operated by International Energy Agency Grimethorpe in England. This paper is a description of the sampling needs and objectives at Grimethorpe, and a detailed description of these automated sampling devices.

21701 (DOE/METC—83-51, pp 29-42) **Sampling procedures used at the Westinghouse high temperature and pressure particulate control test facility.** Ciliberti, D. (Westinghouse Electric Corp., Pittsburgh, PA). 1981. NTIS, PC A18/MF A01.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

This paper describes test facilities and their operation for the testing of particulate samplers in a process stream. The system consists of a fairly large pressure vessel and associated piping which can operate between 200 to 1600°F and 0 to 150 psig and has provisions for injection of virtually any dust type, size, and rate, for sampling at all vessel inlet and outlet points, and for adding sulfur and/or alkali metal compounds in fuel. It can test conventional or rotary flow cyclones, granular bed filters, barrier or bag type ceramic filters, and electrostatic precipatators. A cascading impactor is used for size distribution measurements. Problems associated with the system are discussed. (CKK)

21702 (DOE/METC—83-51, pp 43-64) **Measurement techniques for combustion aerosols.** Shaw, D.T.; Kasper, G. (State Univ of New York, Buffalo). 1981. NTIS, PC A18/MF A01.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

Among the most prominently investigated sources of actual of potential combustion aerosols are automotive emissions, fossil fuel burning, and nuclear accident related fires. Despite differences in composition and origin, aerosols from combustion processes have on property in common: the individual particles tend to be highly irregular. In many cases, branched chain-like aggregates consisting of thousands of primary particles are formed. It is apparent that the spherical particle is an inadequate model for the description of particle dynamics of motion and other physico-chemical processes for these combustion aerosols. It also raises questions regarding meaningful interpretation and comparison of size distribution data obtained by the various types of sampling and classifying instruments in current use. This paper discusses the effects of irregular shape on two particle size classifiers, a Cylindrical Aerosol Centrifuge and a 9-stage low pressure impactor. (CKK)

21703 (DOE/METC—83-51, pp 65-97) **Problem areas in the determination of particle size distribution using inertial classifiers.** McCain, J.D. (Southern Research Inst., Birmingham, AL). 1981. NTIS, PC A18/MF A01.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

Southern Research Institute has been involved in the development and application of inertial particle size classifiers, both cyclonic and impaction, for a number of years. During the course of this work several problem areas have been found in applying inertial sizing devices in industrial source sampling in general, together with some specific problems with regard to high temperature operations. The two major areas to be discussed are: (1) size selective transport losses in probes and sampling nozzles, and (2) difficulties in predicting stage cut diameters at high temperatures. The latter is especially troublesome with cyclone separators. With regard to probe and nozzle losses gravitational settling and horizontal probes can be significant and impaction losses in bent or buttonhook (gooseneck) nozzles have been shown to induce unacceptably large biases in field data. A right angle precollector has been designed which may effectively eliminate the nozzle difficulty.

21704 (DOE/METC—83-51, pp 125-147) **Extractive sampling with dilution probes.** Ensor, D.S.; Ranade, M.B.; Lawless, P.A.; VanOsdell, D.W.; Damle, A.S. (Research Triangle Inst., Research Triangle Park, NC). 1981. NTIS, PC A18/MF A01.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

Dilution probes are used to precondition combustion gases prior to measurement of the aerosol size distribution by electrical aerosol analyzers, optical particle counters, and condensation nuclei counters/diffusion batteries. The guidelines for dilution system design are described to minimize artifacts from particle wall losses, coagulation, and formation. Two field portable systems used by the author are described. Included are system aerosol calibration and field test experience.

21705 (DOE/METC—83-51, pp 148-178) **Sampling experiments in a turbulent pipe flow.** Bajura, R.A.; Lutz, S.A.; Stenger, J.B.; Svinos, J.G. (West Virginia Univ., Morgantown). 1981. NTIS, PC A18/MF A01.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

A series of experiments was conducted using sampling probes to evaluate measurement errors associated with non-isokinetic aspiration rates. The sampled streams were lightly loaded glass bead aerosols consisting of approximately monodisperse particles having mass mean diameters of 3.0, 5.3, and 7.4 microns. The experiments were done in a 4-inch I.D. round pipe using a dual probe arrangement to obtain simultaneous measurements under both isokinetic and non-isokinetic conditions. Stokes numbers varied over a range of 0.02 to 0.24 for probes of two different internal diameters. The trends in the experimental data are in general agreement with data for higher Stokes numbers reported previously in the literature. No apparent differences in sampling accuracy were found when the probes were stationed at the 0.50 and 0.75 radius locations off the centerline. Effects due to the thickness of the sampling probes were observed for all tests with the general result that the concentration measurement was lower in value as the thickness of the probe was increased. Deposition on the probe tip and within the body of the probe accounted for a major portion of the losses in the sample train.

21706 (DOE/METC—83-51, pp 179-188) **Instrument resolution.** Loos, H.G. (Laguna Research Lab., Laguna Beach, CA). 1981. NTIS, PC A18/MF A01.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

This paper describes the calculation of the resolution of instruments which measure particle size distributions. It is shown that increasing the number of channels of the instrument causes the signal-to-noise degradation to increase while the coverage of the size distribution becomes better. To decide on tradeoffs, the kind of physical measurement being performed must be considered. Parallel measurements as opposed to the customary serial measurements of an aerosol should be considered also. Large improvements in instrument resolution may often be made by using automated readout and control by a computer. If the number of measurements is increased by a factor of N, the standard deviation in the data average is diminished by a factor of root N. (CKK)

21707 (DOE/METC—83-51, pp 189-200) **Physical and chemical characterization of fine particle in off-gases from coal combustion and oil shale retorting.** Ondov, J.M. (Lawrence Livermore National Lab., CA). 1981. NTIS, PC A18/MF A01.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

Accompanying the extraction of energy by virtually all of our fossil technologies are by-products aerosols containing toxic and carcinogenic substances on particles of respirable size. Concern for the atmospheric release and effects on human health resulting from subsequent inhalation of these particulate substances has fostered extensive research into process and control technology, atmospheric physics and chemistry, and inhalation toxicology. Indeed, we have been funded by the US DOE to study the physical and chemical properties of process aerosols from coal and oil facilities. The purpose of this work is to develop the source terms of toxic substances for human inhalation dosimetry and to elucidate mechanisms of particles formation and chemical enrichment. In this paper discussed some of the chemical and physical aerosol measurement undertaken in this work.

21708 (DOE/METC—83-51, pp 302-340) **Development of an in-situ real-time particulate monitoring system for application in hostile environments.** Bachalo, W.D.; Poon, C.C. (Spectron Development Labs. Inc., Costa Mesa, CA). 1981. NTIS, PC A18/MF A01.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

Development of the Integrated Particle Sizing System for particulate monitoring in high temperature, high pressure environments is described in this paper. This system, based on two laser light scatter detection techniques offers significant advantages over intrusive sampling techniques when applied to hostile environments. Current developments have been directed toward improving the instrument's performance in industrial environments and simplifying its operation. To this end, significant improvements have been realized in the electronics processing systems, the data handling, and the software. Results obtained during the 100-hour test conducted with the instrument prior to delivery to Morgantown will be reviewed.

21709 (DOE/METC—83-51, pp 341-364) **On-line particulate measurement system for hot pressurized gas streams utilizing laser spectrometers.** Brown, A.; Mohnen, V.A. (State Univ. of New York, Albany). 1981. NTIS, PC A18/MF A01.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

The design of a particulate measurement system to measure the particulate loading in hot (1000°F) pressurized (up to 20 atmospheres) gas streams is described. The system will be installed in the coal gasifier system at the Morgantown Energy Technology Center during the fall of 1981 and used to determine the particle separation efficiency of a developmental particulate removal device (a cyclocentrifuge). The heart of the system is a pair of laser spectometers through which isokinetic sample streams are passed. Particle Measurement Systems Incorporated has developed the spectrometer to permit the particle size and concentration in hot pressurized gas to be measured with a laser-optical system that has been used extensively in less severe gas environments.

21710 (DOE/METC—83-51, pp 365-383) **Application of optical particle measuring systems to high temperature/high pressure process streams.** Knollenberg, R.G. (Particle Measuring Systems, Inc., Boulder, CO). 1981. NTIS, PC A18/MF A01.

From DOE contractor's workshop on particulate sampling and characterization; Morgantown, WV, USA (16 Jun 1981).

Several types of instrument techniques are described for measuring process stream aerosols. The techniques include both extractive sampling at ambient and high pressure and in-situ sampling under ambient process conditions. All techniques are capable of operation of hih temperatures. Size ranges cover 0.3 to 20 microns.

21711 **(DOE/NBM—3008209) Nature of stack emissions from the experimental-scale combustion of crude oil.** Clark, B.R.; Horton, A.D.; Higgins, C.E. (Oak Ridge National Lab., TN (USA)). 1978. Contract W-7405-ENG-26. 24p. NTIS, PC A02/MF A01. Order Number DE83008209.

A series of four combustion tests was made with two crude shale oils. Various combustion parameters were measured to assess the combustion behavior by comparison with similar petroleum fuels. Stack emissions were measured with permanent on-line equipment as well as some specially designed apparatus for collecting volatile organic compounds on solid adsorbents for subsequent analysis. The shale oils burned like typical distillate fuel oils with boiler efficiencies comparable to a No. 6 oil. The stack emissions were considerably different in content from those resulting from the combustion of petroleum fuels. Overall hydrocarbon emissions were quite low, but NO/NO/sub X/ emissions were high, reflecting the large nitrogen content of these oils.

21712 (GSF-BPT—2/81) **Influences of environmental chemicals on the climate and biological after-effects.** (Kiel Univ. (Germany, F.R.). Pharmazeutisches Inst.). May 1981. 218p. (In German). (CONF-8010316—). NTIS (US Sales Only), PC A10/MF A01. Order Number DE83750301.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

The complexity of ecological systems cannot be described by a few simple parameters, the more as recognition of the hazards to the environment from pollutants by means of the changed parameters is extremely difficult. Atmospheric substances such as CO_2, H_2O, ozone and aerosols exert a direct influence on the radiation balance. The effect of concentration modifications of the air pollutants e.g. on the temperature of the atmosphere can be assessed with certain restrictions by means of mathematical models. The present brochure contains papers on this subject which were delivered at the second status seminar of the Gesellschaft fuer Strahlen- und Umweltforschung - GSF in Munich in October 1980.

21713 (GSF-BPT—2/81, pp 13-24) **Effects of anthropogenic chlorine hydrocarbons on the stratospheric ozone layer.** Ehhalt, D.H.; Schmidt, U. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

Stratospheric measurements have so far been carried out only for the gaseous chlorine sources $CFCl_3$, CF_2Cl_2 and CH_3Cl (initiated by industrial plants). They show marked gradients for all three gases above the tropopause. By measurement of the ratios of the reactive chlorine compounds Cl and ClO as well as of the reaction products HOCl, HCl and $ClONO_2$ formed in the reaction cycles, it is possible to check chlorine chemistry modelling even in its details.

21714 (GSF-BPT—2/81, pp 25-30) **Measurement of ions, trace gases and precondensation nuclei in the stratosphere by mass spectroscopy.** Arnold, F.; Henschen, G.; Fabian, R. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

By means of passive chemo-ionisation mass spectrometry (PACIMS), a number of neutral trace gases could be detected in the stratosphere during balloon-borne measurements and quantitatively determined. In the entire range between 23 km and 42 km, cluster ions with the central ions H_3O^+, Hx^+ are dominant. Furthermore particles with at least 700 atomic mass units were detected representing probably multi-ion complexes.

21715 (GSF-BPT—2/81, pp 31-40) **Vertical distribution of CH_3Cl, CF_2Cl_2 and $CFCl_3$ in the stratosphere.** Schmidt, U.; Rudolph, J.; Johnen, F.J.; Ehhalt, D.H.; Volz, A.; Roeth, E.P.; Borchers, R.; Fabian, P. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

The mixing ratios of CH_3Cl, $CFCl_3$ and CF_2Cl_2 in stratospheric air samples collected by a cryogenic sampling device during three balloon flights over southern France were measured. The mixing ratio of CH_3Cl decreases by a factor 10 in heights between 20 and 30 km. The vertical profiles for the two chlorine source gases $CFCl_3$ and CF_2Cl_2 show the typical marked gradients in the stratosphere above a height of 20 km.

21716 (GSF-BPT—2/81, pp 41-53) **Vertical distribution of stable trace gases in mean latitudes.** Fabian, P.; Borchers, R.; Schmidt, U.; Volz, A.; Seiler, W. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

Separately according to years, the volume mixing ratios of H_2, CH_4, CO, N_2O, $CFCl_3$ and CF_2Cl_2 were determined as a function of the height over southern France by means of balloon-borne cryo-collectors. Mainly above 25 km and in the area of the tropopause, year-by-year deviations of details occur which are attributed to dynamic processes.

21717 (GSF-BPT—2/81, pp 54-61) **Measurement of RO_2 and NO_2 in the troposphere by means of ESR and matrix isolation.** Mihelcic, D.; Muesgen, P.; Paetz, W.; Helten, M.; Trainer, M.; Fark, H.; Kempa, D.; Ehhalt, D.H. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

The method of matrix isolation with subsequent analysis by ESR spectroscopy was used for simultaneous determination of RO_2 and NO_2 in the troposphere. The measurements provided mixing ratios of RO_2 radicals and the day and night course of NO_2 and RO_2 radicals in the Juelich-Bonn area in 1 to 6 km height. For the first time RO_2 radicals were found at night.

21718 (GSF-BPT—2/81, pp 62-70) **Measurements of ethane and propane in the troposphere and stratosphere.** Rudolph, J.; Ehhalt, D.H.; Toennissen, A. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

Sufficiently precise measurements of C_2H_6 in the stratosphere are a useful method to determine the mean Cl concentration in the lower stratosphere. They were carried out with the aid of a cryogenic sampler over southern France. As about half of the ozone destruction by ClOsub(x) takes place below 30 km, information on the Cl concentration at lower altitudes is of decisive interest. Contamination problems can be solved and measurement of C_2H_6 can be extended to heights of 35 km.

21719 (GSF-BPT—2/81, pp 71-73) **ESR spectra of ClO in a CO_2 matrix.** Trainer, M.; Fark, H.; Helten, M.; Kempa, D.; Mihelcic, D.; Muesgen, P.; Paetz, H.W.; Ehhalt, D.H. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

The experiments using a CO_2 matrix have shown that the ESR spectrum of ClO can be observed in a molecular matrix. The limit of detection is in the range of 1-5 x 10^{14} ClO spins so that ClO detection in the stratosphere is possible.

21720 (GSF-BPT—2/81, pp 74-76) **Measurement of HO_2 and NO_2 in the stratosphere by means of ESR and matrix isolation.** Helten, M.; Paetz, W.; Trainer, M.; Kempa, D.; Fark, H.; Mihelcic, D.; Ehhalt, D.H. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

In two balloon flights a height profile between 17 km and 34 km was obtained. For measurement of the samples a He-cooled evaporator cryostat was used, by which it is possible to cool down samples in the ESR spectrometer to 4 K.

21721 (GSF-BPT—2/81, pp 77-84) **Measurements of the vertical ozone content of the free atmosphere above 20 km height over the Mount Hohenpeissenberg.** Attmannspacher, W. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

For the measurements a Brewer-Mast-type wet chemical sensor was used. The investigations, carried on for six years, have shown that there may possibly be an influence of solar processes on the vertical profile of the ozone.

21722 (GSF-BPT—2/81, pp 85-92) **Ubiquitous concentration of C_1-C_6 organochlorine compounds in the non-polluted atmosphere.** Kirschmer, P.; Ballschmiter, K. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

The analytical method used consisted in the concentration of greater volumes while using capillary gas chromatography which provides large spectral dispersion, with alternative detection by ECD or FiD. The investigations show a complex base in the lower troposphere, most probably organic chlorine compounds in the C_2-C_6-range.

21723 (GSF-BPT—2/81, pp 98-102) **Field measurements of N_2O emission rates from fertilized and non-fertilized soils.** Seiler, W.; Conrad, R. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

The field measurements were carried out in the surroundings of the city of Mainz. The established vertical N_2O profiles in the soil show that N_2O emitted from the soil into the atmosphere is formed directly on the soil surface or in the uppermost soil layer. After fertilizing with mineral fertilizers the N_2O emission rate actually is increased but the gradient of the N_2O profile in the soil remains uninfluenced. Thus, the flow of N_2O into the atmosphere cannot be dependent on the gradient of N_2O in the soil.

21724 (GSF-BPT—2/81, pp 103-113) **Determination of traces of HCl in the troposphere and stratosphere.** Baechmann, K.; Vierkorn-Rudolph, B. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

The difference between total HCl and HCl in aerosols was determined by sampling with the aid of adsorption tubes; the derivatization of HCl was carried out with 7-oxabicyclo-(4.1.0.)-heptane and by separating the occurring 2-chlorocyclohexanol using gas chromatography. Sampling was done from airplanes and balloons.

21725 (GSF-BPT—2/81, pp 117-127) **Diurnal variations of short-lived trace substances.** Fabian, P.; Pyle, J.A.; Wells, R.J. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

The main interest is on the simulation of diurnal variations of HOsub(x), NOsub(x) and ClOsub(x) radicals and their decay products such as NO_3, N_2O_5, HNO_3, $ClONO_2$, HCl and H_2O_2. The model uses zonal mean values of all variables as a function of geographic longitude and latitude with a latitudinal resolution of II/19 from pole to pole and a height resolution of 0.5 loge from the soil to 60 km of height.

21726 (GSF-BPT—2/81, pp 128-132) **Calculation models on stratospheric ion processes.** Joos, W.; Arnold, F. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

The model solves the steady-state continuity equations whilst neglecting the transport terms of the positive ions H_3O^+ (H_2O)sub(n) and Hx^+ xsub(L)(H_2O)sub(m) for different seasons between 10 and 50 km, the negative ions NO_3^- (HNO_3)sub(i) and the multi-ion complexes. The results obtained are useful for better understanding of ion compositions measured in situ and for planning future field measurements.

21727 (GSF-BPT—2/81, pp 133-138) **Structure and analysis of models for atmospheric reaction kinetics.** Roeth, E.P. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

The models are to make sensitivity studies possible in order to determine the modification of height profiles of concentrations of individual components upon modification of reaction constants. The models have modular character and contain, apart from the steady-state model, a long-term model for prognosis purposes and a short-term model for the interpretation of measuring results.

21728 (GSF-BPT—2/81, pp 141-145) **Investigations on the reaction systems HOsub(X)/ClOsub(X)/NOsub(X) under tropospheric and stratospheric conditions.** Becker, K.H.; Fink, E.H. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

The investigations were carried through with a coolable photochemical reactor, with that system it is possible to determine concentrations of the trace matters down to approximately 0.1 ppm in situ by measuring the absorption spectra in the range of 500-3,500 cm^{-1}. For the latter a built-in FTIR spectrometer was used.

21729 (GSF-BPT—2/81, pp 146-156) **Reaction rates and channel ratios of photochemical processes in the atmosphere.** Marx, W.; Monkhouse, P.; Schurath, U. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

The portion of formaldehyde photolysis frequency forming radicals amounts to 25-30 per cent in the troposphere near the ground. On photolysis of pure acetaldehyde in the atmosphere, CO with about 10 per cent H_2 was found by mass spectroscopy as noncondensable product. The measurements were carried out in a specially constructed appliance.

21730 (GSF-BPT—2/81, pp 157-161) **Photo- and electron-induced halogenation from CF_2Cl_2 and $CFCl_3$.** Schenk, H.; Illenberger, E.; Baumgaertel, H. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

With the aid of an appliance for mass spectroscopy by photo-ionization, the formation of negative ions from CF_2Cl and $CFCl_3$ under synchroton radiation was investigated. For the atmospheric chemistry of CF_2Cl_2, photo-induced pair generation and dissociative electron attachment are of minor importance owing the small cross sections.

21731 (GSF-BPT—2/81, pp 162-170) **Reaction kinetics of oxygen atoms and hydroxyl radicals with tetrachlorethylene.** Kirchner, K.; Vogt, S. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

The investigations were carried out with a flow tube reactor-molecular jet sampling - and a system for mass spectroscopy. Comparison of the speed constants at room temperature showed that the hydroxyl radicals reacted about 10 times faster with C_2Cl_4 than the oxygen atoms. At a mean hydroxyl concentration of 3 x 10^6 particles per ml the half-life period of the C_2Cl_4 in this reaction process was found to be about 350 h. This indicates that the C_2Cl_4 in the lower atmosphere is reduced above all by hydroxyl radicals.

21732 (GSF-BPT—2/81, pp 171-175) **Photolysis rates of chlorine nitrate.** Knauth, H.D.; Schindler, R.N. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

All investigations were carried out under stationary conditions at $ClONO_2$ pressures of 5-10 Torr and at temperatures of +20 to -30 centigrades. All the experiments showed that the dissociation channel $ClONO_2+h \rightarrow Cl+NO_3$ is predominant in the photolysis of chlorine nitrate.

21733 (GSF-BPT—2/81, pp 176-179) **Laboratory measurements of kinetical and thermodynamical data of atmospheric ion-molecule collisions.** Boehringer, H.; Arnold, F. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

The measurements help to understand better the atmospheric ion chemistry. They are carried out with an ion drift tube apparatus suitable to detect reaction speed coefficients and equilibrium constants in the temperature range 40-400 K. The ions $H_3O^+(CH_3CN)_3$ and $H^+(H_2O)_2(CH_3CN)_4$ stand out by their extraordinary stability.

21734 (GSF-BPT—2/81, pp 180-181) **Investigations on the behaviour of organic fluorine compounds on surfaces.** Illenberger, E. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

F11 was examined on a pure iron surface by means of photoelectron spectroscopy and F12 on an iron oxide surface by means of Auger electron spectroscopy. The experiments showed that F12 on an iron oxide surface is significantly more stable.

21735 (GSF-BPT—2/81, pp 93-97) **Release of N_2O from cultivated soils.** Heinemeyer, O.; Jagnow, G. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

The attempt was made to ascertain the actual scale of N_2O immission into the atmosphere by direct measurements according to the 'soil cover method', in order to make detailed forecasts on the prospective development of the ozone shield. There was not always a marked direct connexion between the application of nitrogen fertilizer and subsequent N_2O release. Other influence quantities such as soil humidity and temperature are surely important too.

21736 (K/PS—5003S) **Cooling tower drift deposition measurement at the ORGDP.** Park, S.H. (Oak Ridge Gaseous Diffusion Plant, TN (USA)). 1983. Contract W-7405-ENG-26. 5p. (CONF-830411—1). NTIS, PC A02/MF A01. Order Number DE83005878.

From 29. Institute of Environmental Sciences technical meeting; Los Angeles, CA, USA (18 Apr 1983).

In a continuing effort to investigate cooling tower drift, droplet and mineral deposition fluxes were measured near the cooling towers at the Oak Ridge Gaseous Diffusion Plant (ORGDP) from 1979 to 1982. These measurements were conducted at various times of the year to determine any seasonally induced variation in the deposition pattern. The parameters which affected the deposition flux to the greatest degree were the wind speed and the relative humidity of the ambient air. The chromium deposition flux, as measured by collection in Petrie dishes around the cooling tower, displays two distinctly different regimes for the rate of change of flux with distance. In the near field, up to 600 meters, the approximate rate of decrease of the deposition flux is an order of magnitude per 100 meters; beyond this region, the rate is drastically lower. This chromium deposition rate in the near field agrees with the values obtained by the sensitive paper method, in which the mineral flux is determined from the droplet imprints and a known mineral concentration in the drift. Hence, it is hypothesized that the chromium deposition in the near field results from drift droplets whose trajectories are influenced by the gravity force as well as wind speed; whereas, the chromium deposition pattern beyond the near field is formed from particles whose trajectories depend greatly on the wind speed.

21737 (LBL—13500-Exc.) **Atmospheric aerosol research. Excerpt from the Energy and Environment Division annual report, FY 1981, Chapter 4.** (Lawrence Berkeley Lab., CA (USA)). Sep 1982. Contract AC03-76SF00098. 25p. NTIS, PC A02/MF A01. Order Number DE83004954.

Focus is directed toward characterization, formation and transformation as well as effects of aerosols on precipitation, visibility, and climate. (PSB)

21738 (LBL—13500-Exc., pp 4.2-4.5) **SO_2 oxidation of soot particles exposed to water.** Benner, W.H.; Ljungstrom, E.; Novakov, T. Sep 1982. NTIS, PC A02/MF A01. Contract AC03-76SF00098.

In Atmospheric aerosol research. Excerpt from the Energy and Environment Division annual report, FY 1981, Chapter 4.

The oxidation of SO_2 in the atmosphere leads to the formation of sulfuric acid, which, if incorporated into cloud and rain water and not neutralized by ammonia, can acidify the water. The oxidation of SO_3 can produce gas-to-particle transformations and can lead to haze formation. In the ambient atmosphere, SO_2 is oxidized by a variety of homogeneous and heterogeneous chemical reactions. The research reported here focuses on several heterogeneous (i.e., gas-droplet/particle) reaction pathways, using ambient samples collected from electrostatic precipitators.

21739 (LBL—13500-Exc., pp 4.7-4.10) **Carbon particles in the Arctic.** Rosen, H.J.; Novakov, T. Sep 1982. NTIS, PC A02/MF A01. Contract AC03-76SF00098.

In Atmospheric aerosol research. Excerpt from the Energy and Environment Division annual report, FY 1981, Chapter 4.

Recent studies in the Arctic show the presence of unexpectedly high aerosol concentrations, which appear to have a large anthropogenic component. To investigate the chemical composition, origins, and climatic impact of the aerosol, a collaborative sampling program was started by LBL and NOAA in October 1979. This program has emphasized the analyses of the carbonaceous aerosol and its optical properties, but it also has the capability to determine other major aerosol components. Preliminary results from this study show that large concentrations of combustion-generated particles are present in the Arctic and that they may have a significant impact on the heat balance over this region.

21740 (LBL—13500-Exc., pp 4.10-4.13) **Application of thermal analysis and photoelectron spectroscopy for the characterization of particulate matter.** Dod, R.L.; Novakov, T. Sep 1982. NTIS, PC A02/MF A01. Contract AC03-76SF00098.

In Atmospheric aerosol research. Excerpt from the Energy and Environment Division annual report, FY 1981, Chapter 4.

A technique that will analyze the bulk properties of particles was sought without chemical treatment or preseparation of the sample and to compare these results with ESCA results. Thermal analysis in the evolved-gas-analysis (EGA) mode was investigated.

21741 (LBL—13500-Exc., pp 4.13-4.16) **Theoretical studies of the thermal decomposition of carbonaceous aerosol particulates.** Hansen, A.D.A.; Novakov, T. Sep 1982. NTIS, PC A02/MF A01. Contract AC03-76SF00098.

In Atmospheric aerosol research. Excerpt from the Energy and Environment Division annual report, FY 1981, Chapter 4.

This report presents a theoretical approach to the interpretation of EGA of the graphitic carbon component of aerosol particles.

21742 (LBL—13500-Exc., pp 4.16-4.20) **Application of selective solvent extraction to carbonaceous aerosols.** Gundel, L.A.; Novakov, T. Sep 1982. NTIS, PC A02/MF A01. Contract AC03-76SF00098.

In Atmospheric aerosol research. Excerpt from the Energy and Environment Division annual report, FY 1981, Chapter 4.

Carbonaceous components of particles from New York City, Los Angeles, and Berkeley were very similar when characterized by the selective solvent extraction-carbon analysis technique. Photochemical activity, as indicated by ozone level, was much less intensive in Berkeley and New York City than in Los Angeles, although fractions of polar and nonpolar carbon are very similar for the two locations. Automotive and diesel primary combustion particles differ from ambient particles by enrichment in amounts of nonpolar carbon; however, significant fractions of polar carbon are also associated with all combustion sources studied here.

21743 (LBL—13500-Exc., pp 4.20-4.22) **Relation between concentrations of polynuclear aromatic hydrocarbons and black carbon.** Gundel, L.A.; Rosen, H.J.; Novakov, T. Sep 1982. NTIS, PC A02/MF A01. Contract AC03-76SF00098.

In Atmospheric aerosol research. Excerpt from the Energy and Environment Division annual report, FY 1981, Chapter 4.

In addition to black carbon, particulate organic carbon in ambient aerosols contains primary and secondary organic compounds. In this article, we study the relationship between black carbon concentration and one class of primary organic compounds, polynuclear aromatic hydrocarbons (PAH), in urban carbonaceous particles. These compounds and their oxidized derivatives may constitute part of the health hazards associated with ambient and source aerosols. Earlier work established that a linear relationship exists between concentrations of several polynuclear aromatic hydrocarbons and black carbon for ambient aerosol particles collected in Berkeley during the summer of 1980. Here we investigate that relationship for particles collected in three other sampling locations in the United States during the same season.

21744 (LBL—13500-Exc., pp 4.22-4.23) **Determination of low-z elements simultaneously by charged particle activation analysis.** McKinney, M.; Markowitz, S.S.; Novakov, T. Sep 1982. NTIS, PC A02/MF A01. Contract AC03-76SF00098.

In Atmospheric aerosol research. Excerpt from the Energy and Environment Division annual report, FY 1981, Chapter 4.

Nondestructive techniques have been developed for determining carbon, nitrogen and oxygen require lengthy use of accelerator or reactor time, and the latter method requires large samples. A deuterium activation method for simultaneously determining carbon, nitrogen, and oxygen in atmospheric aerosols by irradiating the sample with one type of charged particle was developed.

21745 (NUREG/CR—3106) **Comparison of five-minute radon-daughter measurements with long-term radon and radon-daughter concentrations.** Young, J.A.; Jackson, P.O.; Thomas, V.W. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76RL01830. 37p. (PNL—4591). NTIS, PC A03/MF A01 - GPO $4.50. Order Number DE83007572.

Five-minute air filter radon daughter measurements were made in 84 buildings in Edgemont, South Dakota, in which annual average radon daughter concentrations have been determined from six 100-hour Radon Progeny Integrating Sampling Unit (RPISU) measurements. Averaging radon concentrations were also determined in 50 of these buildings using Terradex Track Etch detectors. The standard deviation of the difference between the (natural) logarithms of the RPISU annual averages and the logarithms of the air filter measurements (SD-ln) was found to be 0.52. This SD-ln is considerably smaller than the SD-ln of 0.71 between the RPISU annual averages and the air filter measurements reported by ALARA at Grand Junction, Colorado; presumably because a considerable number of air filter measurements in Edgemont were disregarded because of short turnover times or high wind speeds. Using the SD-ln of 0.52 it can be calculated that there would only be a 5% probability in Edgemont that the RPISU annual average would be greater than 0.015 WL if the five-minute measurement were equal to 0.010 WL. This indicates that the procedure used in Edgemont of clearing buildings from remedial action if the five-minute measurement were less than 0.010 WL was reasonable. There was about a 28% probability that the RPISU annual average would be less than 0.015 WL if the five-minute measurement were 0.033 WL, indicating that the procedure of performing an engineering assessment if the average of two five-minute measurements was greater than 0.033 WL was also reasonable. Comparison indicates that the average of two RPISU measurements taken six months apart would provide a dependable estimate of the annual average.

21746 (PB—81-179376) **US - Canada transboundary air pollution: Work Group 3A interium report on strategies and implementation.** (Environmental Protection Agency, Washington, DC (USA). Office of International Activities). 10 Feb 1981. 229p. NTIS.

This is an Interim Report prepared by a US/Canada Work Group in accordance with the memorandum of Intent on Transboundary Air Pollution concluded between Canada and the United States on August 5, 1980. This is one of a set of four reports which represent an initial effort to draw together currently available information on transboundary air pollution, with particular emphasis on acid deposition, and to develop a consensus on the nature of the problem and the measures available to deal with it. While these reports contain some information and analyses that should be considered preliminary in nature, they accurately reflect the current state of knowledge on the issues considered. Any portion of these reports is subject to modification and refinement as per review, further advances in scientific understanding, or the results of ongoing assessment studies become available.

21747 **(PB—81-200800) Controlling sulfur oxides.** (Environmental Protection Agency, Washington, DC (USA). Office of Research and Development). Aug 1980. 32p. (EPA—600/8-80-029). NTIS.

This Research Summary describes EPA's program to develop new and improve existing technologies for sulfur oxide control. As we increasingly turn to coal as the primary utility and industrial fuel, while trying to deal with the problems of acid precipitation, visibility degradation, and unhealthy air, we will have to confront the fact that most of the sulfur oxides emitted over the next two decades will come from plants existing today. If we vigorously pursue the successful demonstration of control technologies and then take advantage of them, especially those that can reduce emissions from existing plants, the adverse health and environmental effects of the troublesome sulfur oxides can be significantly reduced.

21748 **(PB—81-202673) Acid precipitation.** (National Oceanic and Atmospheric Administration, Washington, DC (USA). Environmental Data and Information Service). Feb 1981. 18p. (NOAA—81040201). NTIS.

In view of the nationally increasing use of coal and growing evidence of the detrimental effects of acid precipitation, the Federal Government is preparing a comprehensive 10-year acid-precipitation research plan to study environmental and atmospheric effects and to monitor precipitation acidity. Current issues relate to: the establishment of networks and standards for long-term monitoring and measurement of acid precipitation; the promotion of research on the environmental effects of acid precipitation; and the assessment of the financial costs of acid precipitation and the economic benefits of acid-precipitation control programs, weighed with other pollution-control programs and the national need for increased coal utilization. 81 references are cited as well as institutions active in acid rain research.

21749 **(PB—82-100074) National Emissions Report (1978): National Emissions Data Systems (NEDS) of the Aerometric and Emissions Reporting System (AEROS). Annual report.** (Environmental Protection Agency, Research Triangle Park, NC (USA). Monitoring and Data Analysis Div.). Dec 1980. 388p. NTIS, PC AMF A01.

The National Emissions Report summarizes annual cumulative estimates of source emissions of five criteria pollutants: particulates, sulfur oxides, nitrogen oxides, hydrocarbons, and carbon monoxide. Source emissions data are reported to the U. S. Environmental Protection Agency under provisions of Section 110 of the Clean Air Act, as amended 1977, and EPA Regulations, Title 40, Code of Federal Regulations, Part 51.321. Summary data are presented for the nation as a whole, for individual states, and for Air Quality Control Regions and individual interstate portions thereof. The data compilations result from the operations of the National Emissions Data System (NEDS), which functions as a component of the comprehensive EPA air information system--the Aerometric and Emissions Reporting System (AEROS). AEROS is managed by the National Air Data Branch, Monitoring and Data Analysis Division, Office of Air Quality Planning and Standards, U. S. Environmental Protection Agency at Research Triangle Park, North Carolina 27711.

21750 **(PB—82-106501) Air quality data - 1980 annual statistics including summaries with reference to standards. Annual report.** (Environmental Protection Agency, Research Triangle Park, NC (USA). Monitoring and Data Analysis Div.). Aug 1981. 468p. NTIS, PC AMF A01.

This report presents comprehensive summaries of data produced by the nation's ambient air quality monitoring activities for 1980. The data are summarized in two formats: frequency distribution (Part I) and status of data with reference to standards (Part II). These summaries are based on data acquired through extensive monitoring activities conducted by Federal, state, and local pollution control agencies and submitted to the U.S. Environmental Protection Agency's National Aerometric Data Bank. Information is provided on the six pollutants for which National Ambient Air Quality Standards have been set: total suspended particulates, carbon monoxide, sulfur dioxide, nitrogen dioxide, total hydrocarbons, lead, and ozone. Part II does not include a section for hydrocarbon data since the hydrocarbon standard was established as a guide for meeting the ozone standard and monitoring for hydrocarbons is not currently required.

21751 **(PB—82-106527) National emissions report (1979): National Emissions Data Systems (NEDS) of the Aerometric and Emissions Reporting System (AEROS). Annual report.** (Environmental Protection Agency, Research Triangle Park, NC (USA). Monitoring and Data Analysis Div.). Aug 1981. 1458p. NTIS, PC AMF A01.

The National Emissions Report summarizes annual cumulative estimates of source emissions of five criteria pollutants: particulates, sulfur oxides, nitrogen oxides, hydrocarbons, and carbon monoxide. Source emissions data are reported to the U. S. Environmental Protection Agency under provisions of Section 110 of the Clean Air Act, as amended 1977, and EPA Regulations, Title 40, Code of Federal Regulations, Part 51.321. Summary data are presented for the nation as a whole, for individual states, and for Air Quality Control Regions and individual interstate portions thereof. The data compilations result from the operations of the National Emissions Data System (NEDS), which functions as a component of the comprehensive EPA air information system--the Aerometric and Emissions Reporting System (AEROS). AEROS is managed by the National Air Data Branch, Monitoring and Data Analysis Division, Office of Air Quality Planning and Standards, U. S. Environmental Protection Agency at Research Triangle Park, North Carolina 27711.

21752 **(PB—82-217530) Techniques to determine a company's ability to conduct a quality stack test. Technical assistant document.** Mitchell, W.J.; Estes, E. (Research Triangle Inst., Research Triangle Park, NC (USA)). Mar 1982. 44p. NTIS, PC A03/MF A01.

Techniques to determine a testing company's ability to conduct a quality stack test for compliance or process engineering purposes are presented. The document has four sections. The first identifies characteristics commonly associated with laboratories that have a history of performing high quality stack tests. The second part suggests questions that can be asked of candidate companies during the selection process and presents process information that should be given to them so that they may be evaluated fairly. The third part presents techniques the evaluator can use at a company's laboratory during a pretest selection visit. The last part presents techniques that can be used during and after the actual test to determine the performance of the testing company and to estimate the quality of their test results.

21753 **(PB—82-219031) Methods for estimating wake flow and effluent dispersion near simple block-like buildings. Technical memo.** Hosker, R.P. Jr. (National Oceanic and Atmospheric Administration, Silver Spring, MD (USA). Air Resources Lab.). May 1981. 153p. (NOAA-TM-ERL-ARL—108). NTIS, PC A08/MF A01.

This report is intended as an interim guide for those who routinely face air quality problems associated with near-building exhaust stack placement and height, and the resulting concentration patterns. The report consolidates available data and methods for estimating wake flow and effluent dispersion near isolated block-like structures. The near-building and wake flows are described, and quantitative estimates for frontal eddy size, height and extent of roof and wake cavities, and far wake behavior are provided. Concentration calculation methods for upwind, near-building, and downwind pollutant sources are given. For an upwind source, it is possible to estimate the required stack height, and to place upper limits on the likely near-building concentration. The influences of near-building source location and characteristics relative to the building geometry and orientation are considered. Methods to estimate effective stack height, upper limits for concentration due to flush roof vents, and the effect of changes in rooftop stack height are summarized. Current wake and wake cavity models are presented. Numerous graphs of important expressions have been prepared to facilitate computations and quick estimates of flow patterns and concentration levels for specific simple buildings.

21754 **(PB—82-224643) Acid precipitation in the washington cascades: phase i. Report for 1 Oct 80-30 Sep 81.** Duncan, L.C. (Central Washington Univ., Ellensburg (USA)). Sep 1981. 25p. NTIS, PC A02/MF A01.

Precipitation falling on the Washington Cascades east and windward of the urban Puget Sound area is acidic with a volume average pH of 4.71 at the Cascade Crest (Snoqualmie Pass). Five sampling sites were maintained across the Cascades from January 1981 through July 1981. Twenty-nine watershed source lakes lying along the Cascade Crest 3-20 miles north of the precipitation collectors were sampled in the summer of 1981. Results of acidity tests are given.

21755 **(PB—82-225061) Atmospheric removal processes for toxic chemicals. Technical memo. report.** (National Oceanic and Atmospheric Administration, Silver Spring, MD (USA). Air Resources Lab.). Sep 1980. 41p. NTIS, PC A03/MF A01.

In order to assess the environmental impact of toxic chemicals in the United States, the Oak Ridge National Laboratory (ORNL) is developing a multimedia model to estimate the transport, diffusion, and removal of chemicals in the air-water-soil system. The Atmospheric Turbulence and Diffusion Laboratory (ATDL) was charged with assisting ORNL in the further refinement of the air transport and diffusion model and providing guidance on removal processes for toxic chemicals. This report is a review of the findings on removal processes. An overview is given of the general formulas and experiments regarding removal processes. Sections 3 and 4 contain specific removal methods for trace organic chemicals. Section 5 contains an application of the box model to simply account for all removal mechanisms discussed here. It soon became evident that there is disagreement among the experts regarding the quantitative estimation of removal of common pollutants, and nearly complete ignorance regarding specific organic chemicals.

21756 **(PB—82-226465) Combustion modification controls for stationary gas turbine. Volume I: environmental assessment. Final report Feb 78-Jun 80.** Larkin, R.; Lips, H.I.; Merrill, R.S.; Lim, K.J. (Acurex Corp., Mountain View, CA (USA). Energy and Environmental Div.). Jul 1981. 174p. NTIS, PC A08/MF A01.

The report gives an environmental assessment of combustion modification techniques for stationary gas turbines, with respect to NOx control effectiveness, operational impact, thermal efficiency impact, control costs, and effect on emissions of pollutants other than NOx.

21757 **(PB—82-226473) Combustion modification controls for stationary gas turbines. Volume II: Utility unit field test. Final report Jul 78-Jul 79.** Larkin, R.; Higginbotham, E.B. (Acurex Corp., Mountain View, CA (USA). Energy and Environmental Div.). Jul 1981. 158p. NTIS, PC A08/MF A01.

The report gives methods and results of an environmental assessment test program at Houston Lighting and Power's T.H. Wharton Generating Station, Unit 52. The aim of the program was to measure emissions changes resulting from applying NOx controls. Emissions of trace elements, organic materials, sulfur species, SO2, NOx, CO, and particulate matter were measured. These emissions, under normal and controlled (for NOx) operating conditions, were compared. Source operating data were also analyzed so that changes in operating parameters and efficiency could be assessed. Unit 52 is a General Electric MS 7001C simple-cycle, single-shaft, heavy duty gas turbine, rated at 70.8 MW nominal electrical output. This gas turbine may use either natural gas or distillate oil fuels. The test program was conducted using oil fuel. Water injection was used for NOx control.

21758 **(PB—82-227117) Evaluation of foams for mitigating air pollution from hazardous spills. Final report 29 Oct 76-31 Jul 80.** Gross, S.S.; Hiltz, R.H. (MSA Research Corp., Evans City, PA (USA)). Feb 1982. 85p. (MSAR—80-152). NTIS, PC A05/MF A01.

This program has been conducted to evaluate commercially available water base foams for mitigating the vapors from hazardous chemical spills. Foam systems were evaluated in the laboratory to define those foam properties which are important in mitigating hazardous vapors. Larger scale tests were then conducted in a 3 m x 3 m pan. Polar and nonpolar liquids and liquefied gases were used as test materials. Protein, fluoroprotein, alcohol and aqueous film forming foams were tested at low expansion ratios and surfactant foam agents at low, medium and high expansion ratios. The chemicals tested were acetone, n-butyl acetate, di-ethyl ether, n-octane, triethylamine, benzene, toluene, ethyl benzene, cyclohexane, propane, ethylene, butadiene, ammonia, chlorine, ethylene oxide, hydrogen fluoride and sulfur trioxide.

21759 **(PB—82-227695) Smog chamber experiments to test oxidant related control strategy issues. Final report 1978-81.** Kamens, R.M.; Jeffries, H.E.; Sexton, K.G.; Gerhardt, A.A. (North Carolina Univ., Chapel Hill (USA). Dept. of Environmental Sciences and Engineering). Mar 1982. 240p. NTIS, PC A11/MF A01.

Outdoor smog chamber experiments were performed to address various issues relating to ozone (O3) production and oxidant control strategies. Temperature effects on single hydrocarbon-NOx systems were studied. Propylene-NOx systems were modeled with particular attention to peroxynitric acid chemistry. Mechanisms were developed to model the O3 reactions with the two major isoprene daughter products, methylvinylketone and methacrolein. Chamber systems with isoprene and O3 were also modeled.

21760 **(PB—82-229360) Determination of effects of ambient conditions on aircraft engine emissions: data analysis and correction factor generation.** Donovan, P.J.; Fairchild, W.R.; Graves, K.W. (Calspan Corp., Buffalo, NY (USA)). Sep 1977. 194p. NTIS, PC A09/MF A01.

This report presents a set of correction factors for variations in turbine aircraft HC, CO, NOX and smoke emissions due to nonstandard day ambient temperature, pressure and humidity developed for the United States Environmental Protection Agency, Ann Arbor, Michigan. These correction factors are based on data from three EPA-sponsored full-scale engine tests, two EPA-sponsored combustor rig tests, and additional data solicited from industry sources. Key correlating parameters in this analysis were combustor inlet temperature, combustor inlet pressure, and ambient humidity. The correction factors have been developed using a multiple least squares regression analysis approach using functional emissions models based upon theoretical considerations and an extensive review of current ambient effects literature. Emphasis has been placed upon relating correction factor coefficients within a general engine class to various operating characteristics of each individual engine.

21761 **(PB—82-232067) Annual report 1974, U.S. Environmental Protection Agency, Office of Research and Development, Research Triangle Park, North Carolina.** (Environmental Protection Agency, Research Triangle Park, NC (USA)). 1974. 153p. NTIS, PC A08/MF A01.

This is the Annual report of the office of Research and Development at Research Triangle Park, EPA. The Office of Research and Development is a large research organization whose basic programs encompass air pollution, pesticides pollution, and radiation pollution. This summary provides a brief discussion of some of the major accomplishments of the research program during 1974 and indicates its future direction.

21762 **(PB—82-232448) Characterization of diesel emissions from operation of a light-duty diesel vehicle on alternate source diesel fuels.** Bykowski, B.B. (Southwest Research Inst., San Antonio, TX (USA)). Nov 1981. 74p. NTIS, PC A04/MF A01.

This report describes laboratory emissions evaluation of several alternate-source fuels in a 1980 Volkswagen Rabbit Diesel. Fuels tested included a No. 2 petroleum diesel as base, base plus coal-derived liquids, shale oil diesel fuel and jet fuel, and a blend of petroleum blend stocks with coal and shale liquids. Nine fuels were investigated in all, including the base fuel.

21763 **(PB—82-234147) Characterization of diesel emissions from operation of a light-duty diesel vehicle on alternate source diesel fuels. Final report Jun 80-Oct 81.** Bykowski, B.B. (Southwest Research Inst., San Antonio, TX (USA)). Nov 1981. 190p. NTIS, PC A09/MF A01.

Several alternate source diesel test fuels were studied to note their effects on regulated and unregulated exhaust emissions from a 1980 Volkswagen Rabbit. Nine fuel blends were tested, including a No. 2 petroleum diesel as base, base plus coal-derived liquids (via SRC-II and EDS processes), shale oil diesel and jet fuel, and other blends of coal-derived liquids, shale oil liquids, and petroleum stocks. Analyses performed include gaseous hydrocarbons, CO, NOx, particulate mass, phenols, smoke, odor, Ames tests, BaP, and polarity by HPLC. Smoke and particulate increases were generally associated with use of coal-derived liquids.

21764 **(PB—82-240714) Nitrogen oxides: an annotated bibliography.** (National Air Pollution Control Administration, Raleigh, NC (USA)). Aug 1970. 638p. NTIS, PC A99/MF A01.

This publication contains abstracts of a sample of the existing literature on the nitrogen oxides, 1959-1970 (with some earlier works). The full text of each abstract is contained in APTIC and the APTIC accession number is given. Oxides of nitrogen are important factors in air pollution since the complex chain reaction that produces smog is initiated by photolysis of nitrogen dioxide. In high concentrations, nitrogen oxides themselves may be toxic to humans and vegatation. There are occupational hazards associated with nitrous oxides, and the widespread persistence of nitrogen oxides from gasoline engine exhaust and from other community sources, have recently made it mandatory to know more about the biological effects and physical and chemical properties. (Author, Subject, and Geographic Location Index.)

21765 **(PB—82-240797) AEROS (Aerometric and Emissions Reporting System) information.** (Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards). 1974. 20p. NTIS, PC A02/MF A01.

The Aerometric and Emissions Reporting System (AEROS) is a comprehensive computer-based system established by the National Air Data Branch to collect, store and analyze air pollution data. The data are collected by the various state and local agencies and reported to EPA. These data are then stored and analyzed in AEROS. The most noteable feature of AEROS is that it is a reporting system. The primary function of AEROS is to provide concise and standardized reports on various aspects of air pollution. AEROS is composed of several subsystems, some of which are capable of functioning as independent data systems. The intent of this pamphlet is to show the relationships between the various AEROS subsystems and the information available from each.

21766 **(PB—82-241688) Evaluation of system variables in stage II refueling operations. Final report.** Piserchia, P.V. (Research Triangle Inst., Research Triangle Park, NC (USA)). 3 Jul 1975. 40p. NTIS, PC A03/MF A01.

This report covers the statistical analysis of the variables affecting hydrocarbon emissions during Stage II refueling operations for vapor balance recovery systems done by the staff of Research Triangle Institute, Research Triangle Park, NC. The purpose of the analysis was to assist the Environmental Protection Agency (EPA) in developing compliance test procedures for vapor balance recovery systems at service stations. In particular, the analysis was performed in order to determine the number of vehicles needed to establish a baseline curve for the system and to estimate and test, statistically, the significance of the estimated vapor emission rate.

21767 **(PB—82-242231) Air quality criteria for photochemical oxidants.** (National Air Pollution Control Administration, Washington, DC (USA)). Mar 1970. 206p. NTIS, PC A10/MF A01.

This document summarizes the current scientific knowledge of photochemical air pollution, and attempts to pick up the major deficiencies in that knowledge and the presently recognized needs for further research. This report focuses on photochemical oxidants as they are found in the ambient air. In general, discussions in the earlier chapters are oriented towards the physical and chemical nature of these oxidants, atmospheric concentrations and measurement of these oxidants, and possible natural sources of ozone. The presence of photochemical oxidants in the ambient air is then considered in later chapters in relation to (1) effects on vegetation, (2) effects on materials, (3) toxicological studies of effects on animals and man, and (4) epidemiological studies.

21768 **(PB—82-243288) Preliminary air pollution survey of hydrogen sulfide: a literature review.** Miner, S. (Litton Systems, Inc., Bethesda, MD (USA). Environmental Systems Div.). Oct 1969. 105p. NTIS, PC A06/MF A01.

This is a preliminary literature review representing present knowledge of hydrogen sulfide and its effects on humans, animals, plants and materials. Hydrogen sulfide is a colorless gas that has an obnoxious odor at low concentrations. The odor threshold is in the g/cu m range. In higher concentrations, the gas is toxic to humans and animals and corrosive to many metals. It will tarnish silver and react with heavy metals in points to discolor the paint. In humans, it will cause headache, conjunctivitis, sleeplessness, pain in the eyes, and similar symptoms at low air concentrations and death at high air concentrations. However, the majority of the complaints arising from hydrogen sulfide air pollution are due to its obnoxious odor in extremely low air concentrations. Air pollution by hydrogen sulfide is not a widespread urban problem but is generally localized in the vicinity of an emitter such as kraft paper mills, industrial waste disposal ponds, sewage plants, refineries, and coke oven plants.

21769 **(PB—82-244005) Guidance for the future use of NASN (This guideline replaces OAQPS number 1.2-020).** (Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards). Jun 1977. 10p. (OAQPS—1.2-075). NTIS, PC A02/MF A01.

This guidance is a replacement for OAQPS 1.2-020, 'Guidance for Decentralization and Continued Operation of the NASN,' September 1974. This material should clarify the integration of the NASN into the ambient monitoring program discussed in the draft Air Monitoring Strategy Document and should be used by Regions in their evaluation of state and local monitoring programs.

21770 **(PB—83-114736) 1976 national emissions report: national emissions data system of the aerometric and emissions reporting system (AEROS). Annual report.** (Environmental Protection Agency, Research Triangle Park, NC (USA). Monitoring and Data Analysis Div.). Aug 1979. 44p. NTIS, PC A03/MF A01.

The National Emissions Report summarizes annual cumulative estimates of source emissions of five criteria pollutants: particulates, sulfur oxides, nitrogen oxides, hydrocarbons, and carbon monoxide. Source emissions data are reported to the U.S. Environmental Protection Agency under provisions of Section 110 of the Clean Air Act, as amended 1977, and EPA Regulations, Title 40, Code of Federal Regulations, Part 51.321. Summary data are presented for the nation as a whole, for individual states, and for Air Quality Control Regions and individual interstate portions thereof. The data compilations result from the operations of the National Emissions Data System (NEDS), which functions as a component of the comprehensive EPA air information system--the Aerometric and Emissions Reporting System (AEROS). AEROS is managed by the National Air Data Branch, Monitoring and Data Analysis Division, Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, at Research Triangle Park, North Carolina 27711.

21771 **(PB—83-115600) National air pollutant emission estimates, 1970-1981. Final report.** (Environmental Protection Agency, Research Triangle Park, NC (USA). Monitoring and Data Analysis Div.). [nd]. 44p. NTIS, PC A03/MF A01.

This report presents estimates of trends in nationwide air pollutant emissions for the five major pollutants: sulfur oxides, particulates, carbon monoxide, volatile organic compounds, and nitrogen oxides. Estimates are broken down according to major types of air pollutant sources. A short analysis of emission trends is given, along with a discussion of methods used to develop the data.

21772 (PB—83-117911) Continuous rural ozone data collection in the northeast United States. (Environmental Research and Technology, Inc., Concord, MA (USA)). Nov 1980. 49p. NTIS, PC A03/MF A01.

This report presents rural ozone data collected in the Northeast United States during the summer period of July 1 to September 12, 1980. The monitoring was performed at four former Electric Power Research Institute-Sulfate Regional Experiment (EPRI-SURE) monitoring stations at Montague, MA; Scranton, PA; Indian River, DE; and Lewisburg, WV.

21773 (PB—285174) Simulation of nutrient loss from soils due to rainfall acidity. Reuss, J.O. (Environmental Protection Agency, Corvallis, OR (USA). Environmental Research Lab.). May 1978. 57p. (EPA—600/3-78-053). NTIS.

This paper describes a simulation model that provides a quantitative system utilizing established relationships from soil chemistry to predict the most-likely effect of rainfall acidity on the leaching of cations from noncalcareous soils. The model utilizes the relationships between lime potential (pH - 1/2 pCa) and base saturation described by Clark and Hill (Soil Sci. Soc. Amer. proc. 28:490-492, 1962) and Turner and Clark (Soil Sci. 99:194-199, 1964), the equilibrium between CO_2 partial pressure and H^+ and HCO_3^- in solution, the apparent solubility product of $AL(OH)_3$, the equilibrium of cations and anions in solution, the Freundlich isotherm description of sulfate adsorption, and mass balance considerations, to predict the distribution of ions between the solution and sorbed or exchangeable phases. Ionic composition of leachates in response to rainfall composition can thus be computed. Ions considered in the present version are H^+, Ca^{2+}, Al^{3+}, SO_4^{2-}, CL^-, and HCO_3^-. The model predicts almost exact chemical equivalence between basic cation removed in the leachate and strong-acid anions entering the system in the rainfall if pH - 1/2 pCa is above 3.0, at which point the base saturation will generally not exceed 20%. At lower pH - 1/2 pCa values leaching of anions in association with H^+ and Al^{3+} becomes significant and these cations predominate when pH - 1/2 pCa falls below 2.0.

21774 (PNL—4599) MAP3S Precipitation Chemistry Network: fifth periodic summary report (1981). Dana, M.T.; Rothert, J.E. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1983. Contract AC06-76RL01830. 252p. NTIS (US Sales Only). Order Number DE83007992.

This, the fifth in a series of summary reports, contains complete field and chemical data from the MAP3 Precipitation Chemistry Network for the year 1981. The 1981 data were added to the previous data base, and an update of the previous five year statistical summary completed. Included are basic statistics, time trend analyses, and monthly averages.

21775 (PNL-SA—10480) Potpourri of deposition and resuspension questions. Slinn, W.G.N. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76RL01830. 57p. (CONF-821136—19). NTIS, PC A04/MF A01. Order Number DE83007076.

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

Twenty questions and answers are listed dealing with particulate deposition, resuspension, and precipitation scavenging.

21776 (PNL-SA—10481) Inland transport, mixing, and deposition of sea-salt particles. Slinn, W.G.N. (Pacific Northwest Lab., Richland, WA (USA); Washington Univ., Seattle (USA). Dept. of Atmospheric Sciences; Oregon State Univ., Corvallis (USA). Dept. of Atmospheric Science). Jan 1983. Contract AC06-76RL01830. 11p. (CONF-821136—20). NTIS, PC A02/MF A01. Order Number DE83007082.

From 4. international conference on precipitation scavenging, dry deposition and resuspension; Santa Monica, CA, USA (29 Nov 1982).

The objective was to deduce dry deposition velocities for submicron particles of sea-salt depositing on forests. Aircraft measurements were made on particles with diameters as small as 0.1 μm. This report describes the experimental design, results from three flights, interpretations, and suggestions for future research. (ACR)

21777 (SP-RAPP—1979:22-PT-1) Evaluation of filter-tape analyzing devices, part 1. Aakesson, E. (Statens Provningsanstalt, Boraes (Sweden)). 1979. 25p. (In several languages). NTIS, PC A02/MF A01.

Analyzers are discussed that are available for: toluenediisocyanate, methylenediisocyanate, organic isocyanates, H_2S, phosgene, dinitrotoluene, HCl, Cl, SO_2, NH_3, NO_2, vinyl chloride, hydrazine and toluenediamine. Filter-tape devices exist both in the transportable and in the portable form. Portable environmental measuring devices are now on the market for toluene-diisocyanate, phosgene and hydrazine.

21778 (SP-RAPP—1980:11-PT-2) Evaluation of filter-tape analyzing devices, part 2. Aakesson, E.; Stridh, G.; Lundgren, B. (Statens Provningsanstalt, Boraes (Sweden)). 1980. 24p. (In Slovene). NTIS, PC A02/MF A01.

The use of the devices in places of work is surveyed. In Sweden, almost the only use of these devices is the recording of the toluene diisocyanate (TDI) content in the air, as a control in the handling of TDI in polyurethane foam manufacturing. Generally the users are satisfied with these analyzers. Data and application fields are reported for stationary and portable devices.

21779 Nonideal collection characteristics of a cascade impactor with various collection substrates. Barr, E.B.; Newton, G.J.; Yeh, H.C. (Lovelace Biomedical and Environmental Research Inst., Inc., Albuquerque, NM). *Environmental Science and Technology;* **16**: No. 9, 633-635(Sep 1982). Contract AC04-76EV01013.

A series of collection substrates was used to evaluate the dependence of collection efficiency on substrate type on one stage of a seven-stage cascade impactor. Data obtained were used to determine which substrates yielded the best collection characteristics for cascade impactors. Stainless steel, silver membrane filters, and cellulose acetate membrane filters as cascade impactor collection substrates showed stage collection characteristics that closely fit theoretical predictions. Fiber-type substrates showed the most deviation from the theoretical efficiency curve.

21780 The use of principal component factor analysis to interpret particulate compositional data sets. Roscoe, B.A. (Univ. of Illinois, Urbana); Hopke, P.K.; Dattner, S.L.; Jenks, J.M. *Journal of the Air Pollution Control Association;* **32**: No. 6, 637-642(Jun 1982). Contract AC02-80EV10403.

The study of urban aerosols often yields large data bases consisting of elemental and meteorological data for a multitude of samples collected at various locations and times. Several statistical techniques are currently being used to identify the nature of aerosol sources using these data. However, errors present in the data base may make the interpretation difficult. In addition to its value as a receptor model, principal component factor analysis has the ability to identify the errors present in the data so that appropriate corrections may be made before detailed data interpretation is attempted. Thus the technique can save much time and effort. Principal component factor analysis can yield interpretations of aerosol data and a better understanding of the airshed being studied.

21781 Statistical analysis of nephelometer regional field data. Babson, B.L. (Systems Applications, Inc., San Rafael, CA); Bergstrom, R.W.; Samuelson, M.A.; Seigneur, C.; Waggoner, A.; Malm, W.C. *Atmospheric Environment;* **16**: No. 10, 2335-2346(1982).

Visual air quality can be specified in terms of the visual range calculated from a point measurement of the particle scattering coefficient. This paper investigates the difference between point and spatially averaged scattering coefficient in terms of its impact on calculated visual range and plume-horizon contrast. Nephelometer measurements taken simultaneously at three different locations during a three-week period from 28 June to 13 July 1979 were investigated to determine their spatial variability. The investigation showed three distinct types of atmospheric conditions that could be characterized both by nephelometer data and by the origin of the ambient air: a regional-haze period, which corresponded to a fairly homogeneous atmosphere; a forest-fire period, which corresponded to a rather inhomogeneous atmosphere and a clear-background period. The standard deviations were used to estimate the corresponding uncertainties in visual range calculations and to estimate the sensitivity of plume visibility model predictions to these uncertainties. Relative deviations in plume contrasts were calculated for four typical case studies. The deviations ranged from 1 to 43 per cent for absolute contrast values above 0.02, depending on plume-observer distance, wavelength and the original visual range value.

21782 **Physical, chemical and optical characteristics of a clean air mass over northern Michigan.** Alkezweeny, A.J.; Laulaninen, N.S.; Thorp, J.M. (Batelle Pacific Northwest Lab., Richland, WA). *Atmospheric Environment;* **16**: No. 10, 2421-2430(1982). Contract AC06-76RL01830.

Characterization of a clean air mass over and near Seney National Wildlife Refuge was undertaken during June 1979. The study which provides baseline information relative to the prevention of significant deterioration in national parks and wilderness areas, consisted of aircraft measurements of aerosol size distributions, aerosol elemental and chemical composition, aerosol light scattering and light absorption coefficients and trace gas concentrations, including ozone and sulfur dioxide. The aerosol light absorption coefficients in this clean air mass were essentially zero, implying a negligible amount of elemental carbon aerosol. Ozone concentrations were variable between 40 and 60 ppbv. The range of SO_2 concentrations was 0.3-2.0 ppbv with an average value of about 0.6 ppbv; these values are also similar to background concentrations found elsewhere in clean continental air. Trace element concentrations were comparable with those found in other clean areas and indicated a significant crustal component. Enhanced levels of Pb and Br suggest automotive exhaust from local activity possibly contributed to background aerosol levels. The clean air measurements were also compared to measurements made on the same day in a nearby slash-burn smoke plume.

21783 **Street level versus rooftop sampling: carbon monoxide and aerosol in New York City.** Bauman, S.E. (City Univ. of New York, Brooklyn); Williams, E.T.; Finston, H.L.; Ferrand, E.F.; Sontowski, J. *Atmospheric Environment;* **16**: No. 10, 2489-2496(1982). Contract AC02-76ER03126.

Aerosol samples were simultaneously collected with three cascade impactors for 2-h periods; two of the impactors were located at street level and the third was located on the 16th floor, all on the same city block in Manhattan. Carbon monoxide was also measured at all three sites. Particle-size distributions of the respective elements were similar, in contrast with the concentrations, which were not. The concentrations at street level, e.g., lead and CO, decreased with height as expected. On the other hand, the concentrations of particulate sulfur did not diminish with height. The results obtained from the two cascade impactors and CO monitors located around the corner from each other at street level show significantly different pollutant concentrations, thereby indicating the difficulty in obtaining representative samples at street level.

21784 **Relative importance of atmospheric sulfates and nitrates in visibility reduction.** Tang, I.N. (Brookhaven National Lab., Upton, NY). *Atmospheric Environment;* **16**: No. 11, 2753(1982).

We wish to report a computational error in our recent paper published in Atmospheric Environment 15, 2463 (1981; I.N. Tang, W.T. Wong, and H.R. Munkelwitz). In comparing the extinction coefficients between the external and internal mixtures for mixed sulfate-nitrate aerosols, we stated in the paper that the basis of computation used was 1 $\mu g\ m^{-3}$ of dry salt content for all cases. As it turned out, we had used by mistake 1 $\mu g\ m^{-3}$ of the aqueous salt solution at the deliquescence point in the calculation for the internal mixtures. Since the salt content of the aerosol as internal mixture was inadvertently made less than that of the corresponding aerosol as external mixture, the comparison as presented in Figures 9 and 10 of the original paper is no longer meaningful. We have subsequently recomputed the extinction coefficients for the internal mixtures on the originally stated basis of 1 $\mu g\ m^{-3}$ of dry salt content. As before, the extinction coefficient curves calculated for the four different aerosol size distributions of each internal mixture tend to group together. It seems now that the internal mixture shows a better agreement with the statistical correlation of Cass than does the external mixture. For practical purposes, however, the difference in visibility reduction by sulfate-nitrate aerosols of either type of mixtures is indeed very small, especially at relative humidities below 60% when all aerosol particles are in the crystalline state or about 80% when they all have become homogeneous solution droplets.

21785 **Determination of condensation nuclei using a modified Aitken method.** Kubie, G.; Schless, D. pp vp of Aerosols in science medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981). (In German)

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

A test set-up for ultra-microscopic detection of condensation nuclei according to the Aitken-method is described, and it is shown that due to the delay of a video camera tube the video-technique allows to store flashlight shots of condensation particles such as they occur in an expansion cloud chamber. The possibilities resulting from that technique are stated.

21786 **Analysis of continuous flow condensation nuclei counters.** Metayer, Y.; Perrin, M.L.; Madelaine, G. pp vp of Aerosols in science medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

Calculations and experimental results exhibit a good agreement. Thus the model developed seems to give an accurate description of the phenomena occuring in the Continuous Flow CNC's. For concentrations larger than 10^4 $p.cm^{-3}$, the final droplets size decreases and a significant vapor's reduction occurs. This result explains the irregular shape of the factory calibration curve for the large concentrations range. Furthermore, for a concentrated polydisperse aerosol, a dilution technique must be used for meaningful measurements.

21787 **Natural ion concentration in air as an indication of atmosphere pollution by nanometer aerosol particle.** Drozdowicz, B.; Niziol, B.; Wandzilak, P.; Wcislak, L.; Jura, Z. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

The relation between natural ion concentration in air and atmosphere pollution by ultrafine aerosol particles has been shown. The notion 'ion' in this paper applies to charged atoms and molecules of gaseous air component and charged aerosol particles present in air. On the ground of electrical mobility value a classification of ions present in atmospheric air has been carried out.

21788 **New approach to the determination of atmospheric strong acids.** Niessner, R.; Klockow, D. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

21789 **Time sequential sampling and elemental analysis of indoor and outdoor aerosol.** Jupe, H.; Richter, F.W.; Waetjen, U. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

The paper deals with aerosol sampling by a so called 'streaker', elemental analysis by proton induced X-ray emission, comparison of streaker data with high volume data and gives finally an application to urban aerosol investigation.

21790 **Investigation to the separation efficiency of a cyclone seporator using a stray light particle size counting technique.** Mothes, H.; Loeffler, F. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981). (In German)

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

As part of this work separation efficiency curves and low particle concentrations and particle size distributions in the cyclone separation room were experimentally established on a test cyclone by means of a stray light particle size counting technique. To this effect sampling probes were used to take samples of the dust-loaded gas in the inlet, outlet and separation room of the cyclone partial flows by isokinetic sampling, for which the particle concentration and particle size distribution were obtained with a stray light measuring technique. It was shown that with the stray light measuring device separation efficiency curves can be detected rapidly and with a high sensitivity. During the measurements the cyclone geometry as well as the throughput and the crude gas dust concentration were subject to variations. New perceptions were gained especially concerning the influence of the dust concentration upon the separation efficiency. In addition the experimental results provide valuable hints for the theoretical models; they prove for example that the deterministic model assumption correctly describes the local distribution of the particle sizes in the separation room.

21791 **Measurement procedure for acquisition of spatial imhomogeneous aerosol concentrations.** Willms, I. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

For the acquisition of spatial inhomogeneous distributed aerosols a method has been developed, which is based on the evaluation of a set of optical extinction measurements. The evaluation is accomplished by a modified computer tomographical method. This method is relatively insensible to errors in the input data. Thus even with measurement data gained by means of a simply constructed model of the measurement apparatus evaluable results can be obtained.

21792 **Aerosol measurement by photon correlation spectroscopy.** Itoh, M.; Takahashi, K. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

21793 **Structure and bonding of transition metal-sulfur dioxide complexes.** Ryan, R.R.; Kubas, G.J.; Moody, D.C.; Eller, P.G. (Los Alamos National Lab., NM). *Structure and Bonding (Berlin);* **46**: 47-100(1981).

This review has attempted to summarize presently known information on the structure and bonding of transition metal-SO_2 complexes. The relationship between M-SO_2 bonding type and the pertinent metal orbital template has been illustrated and, where appropriate, inferences have been made with respect to SO_2 reactivity. In addition the unique utility of SO_2 as a bonding probe for transition metal species has been discussed. It is evident that SO_2 is unmatched among small molecule ligands in the variety of coordination modes it exhibits in transition metal complexes. Emerging chemistry of M-SO_2 species demonstrates the feasibility of novel reaction chemistry, reversible binding, and perhaps even useful catalytic systems having interesting academic as well as practical significance. New types of SO_2 binding and reactivity are anticipated with further study. 210 references.

21794 **(AD-A—115514/2) A two step method to treat variable winds in fallout smearing codes. Master's thesis.** Hopkins, A.T. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Mar 1982. 136p. (AFIT/GNE/PH—82M-10). NTIS, PC A07/MF A01.

A method was developed to treat non-constant winds in fallout smearing codes. The method consists of two steps: (1) location of the curved hotline (2) determination of the off-hotline activity. To locate the curved hotline, the method begins with an initial cloud of 20 discretely-sized pancake clouds, located at altitudes determined by weapon yield. Next, the particles are tracked through a 300 layer atmosphere, translating with different winds in each layer. The connection of the 20 particles' impact points is the fallout hotline. The hotline location was found to be independent of the assumed particle size distribution in the stabilized cloud. The off-hotline activity distribution is represented as a two-dimensional gaussian function, centered on the curved hotline. Hotline locator model results were compared to numerical calculations of hypothetical 100 kt burst and to the actual hotline produced by the Castle-Bravo 15 Mt nuclear test.

21795 **(ANL/NESC—47) CLOUD; gamma-ray dose rate from a cloud.** Cooper, R.E. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048047.

The CLOUD program calculates the external gamma-ray dose rate and total integrated dose resulting from the continuous release of radioactive materials to the atmosphere.IBM360; FORTRAN IV; 32K memory.

21796 **(EGG—1183-1835) Aerial radiological survey of the Callaway Plant and surrounding area, Fulton, Missouri.** (EG and G, Inc., Las Vegas, NV (USA). Energy Measurements Group). Dec 1982. Contract AC08-76NV01183. 12p. NTIS, PC A02/MF A01. Order Number DE83007884.

An aerial gamma survey was conducted over the Callaway Plant and the surrounding area in April 1982. The survey included the plant water intake and discharge location on the Missouri River. Separate ground-based ion chamber measurements and soil samples were collected in the survey area to support the aerial data. Gamma data, stored on magnetic tape, were searched for evidence of man-made gamma emitters. A contour map of the terrestral exposure rate plus the cosmic exposure rate at 1 meter was prepared and overlaid on a photograph and a USGS topographic map of the area. The exposure contour map is typical for farmland in the mid-western United States. Terrestrial plus cosmic exposure rates ranged from 4 microroentgens per hour (μR/h) over the Missouri River to a maximum of 12 μR/h over the cultivated land. A ^{137}Cs calibration source was detected at the Callaway Plant site.

21797 **(EML—412, pp II.5-II.82) Quarterly ^{90}Sr deposition at world land sites.** Larsen, R. 1 Nov 1982. NTIS, PC A13/MF A01.

In Environmental Measurements Laboratory. Environmental report, March 1-September 1, 1982.

The results of quarterly ^{90}Sr data at 75 sites beginning in 1976 through 1981 are reported. Of the 75 sites for which quarterly data are reported, the monthly collections at 67 sites are composited and analyzed quarterly starting with the July 1976 samples. Calculated values of concentrations of ^{90}Sr in precipitation are given in units of pCi of ^{90}Sr per liter. The precipitation in centimeters and the ^{90}Sr deposition in millicuries per square kilometer is given for each quarter where data are available.

21798 (EML—412, pp II.83-II.183) **Project airstream: radioactivity in the lower stratosphere.** Leifer, R.; Larsen, R. (Environmental Measurements Lab., New York, NY). 1 Nov 1982. NTIS, PC A13/MF A01.

In Environmental Measurements Laboratory. Environmental report, March 1-September 1, 1982.

Project Airstream is a study of radioactiviy and nonnuclear compounds in the lower stratosphere employing the WB-57F aircraft as a sampling platform. Radioactivity data are reported for the missions flown in July 1980, October 1980, July 1981, October 1981 and April 1982. Gamma measurements were made on Be-7, Zr-95, Cs-137, and Ce-144. Radiochemical analyses are reported for Sr-90, Pu-239, 240, and Pb-210. (JGB)

21799 (ENICO—1116-Suppl.1(11-82)) **ICPP effluent monitoring report, November 1982.** Guinn, L.A. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Jan 1983. Contract AC07-79ID01675. 53p. NTIS, PC A04/MF A01. Order Number DE83007919.

Covers reporting period, October 20, 1982 through November 19, 1982. There have been no significant or unplanned releases to date in CY-1982. A summary of the total airborne, liquid and solid releases to date for CY-1982 are graphed. The airborne activity forecast is based on the assumption that the electrolytic dissolution would run for approximately 15 days during the first quarter; however, this did not occur. Both radioactive and chemical effluents are included.

21800 (INIS-mf—7499, pp v) **Radioactivity of fly ash from power plants in North Bohemian and East Bohemian Regions.** Vlcek, J. (Krajska Hygienicka Stanice, Hradec Kralove (Czechoslovakia)); Martinec, M. (Krajska Hygienicka Stanice, Usti nad Labem (Czechoslovakia)); Husak, V. (Fakultni Nemocnice, Olomouc (Czechoslovakia). Oddeleni Nuklearni Mediciny). 1980. (In Czech). .

From 10. radiation hygiene days conference; Vranov nad Dyji, Czechoslovakia (7 Oct 1980).

Published in summary form only.

21801 (N—82-18268) **Radiation environment mapping.** Benton, E.Y. (San Francisco Univ., CA (USA)). Nov 1981. 3p. NTIS, PC A08/MF A01.

In NASA. Marshall Space Flight Center Spacelab Mission 1 Expt. Descriptions 3 p (SEE N82-18234 09-12).

An experimental set up to map the cosmic radiation field inside the Spacelab vehicle to determine the potential biological hazards present is described. In addition to the integral linear energy transfer (LET) spectrum for protons and HZE particles, the parameters to be determined include the total radiation dose, fluence of neutrons, protons, and high charge and energy (HZE) particles. These results are to be derived from measurements made in passive dosimeters.

21802 (NUREG/CR—2584) **Meteorological considerations in the development of a real-time atmospheric dispersion model for reactor effluent exposure pathway.** Van der Hoven, I. (National Oceanic and Atmospheric Administration, Silver Spring, MD (USA). Air Resources Lab.). May 1982. 23p. NTIS, PC A02/MF A01.

Meteorological considerations, as part of an overall emergency plan in the event of an inadvertent atmospheric release of radioactive effluents from a nuclear reactor, are discussed in terms of the site meteorological measurement capability, the atmospheric transport and diffusion prediction requirements, the source term configuration, and the requirements posed by special site characteristics such as coastal, valley, and mountainous locations.

21803 (NUREG/CR—2637) **Emergency response capabilities and example assessments for airborne radionuclide discharges.** Start, G.E.; Cate, J.H.; Ackermann, G.R.; Dickson, C.R. (National Oceanic and Atmospheric Administration, Idaho Falls, ID (USA). Air Resources Lab.). May 1982. 38p. NTIS, PC A03/MF A01.

An existing emergency response capability has been developed for the Idaho National Engineering Laboratory by the National Oceanic and Atmospheric Administration Air Resources Laboratories Field Research Office. The system consists of several existing computers and associated data collection facilities. This equipment has been coordinated into a useful capability providing initial and ongoing analysis of meteorological and radiological information. In the event of a radiological emergency, this information may be used to assist action plan formulations and decisions for the area in and around the Snake River Plain in Southeast Idaho.

21804 (PB—83-114702) **^{237}U nelle ricadute atmosferiche): Ispra 1980 (^{237}U in atmospheric fall-out): Ispra 1980).** Dominici, G.; Malvicini, A. (Commission of the European Communities, Ispra (Italy)). [nd]. 20p. NTIS PC E03/MF E03.

The presence of ^{237}U, due to a nuclear test performed on October 16th, 1980 by the Chinese Peoples' Republic has been detected in air by gamma spectrometry. Concentration data for the period October 1980 - February 1981 for ^{237}U and the other radionuclides normally present in the fall-out after an atmospheric nuclear test are reported.

21805 (Y/DD—318) **Reduction in airborne contamination levels at the 9201-5 Arc Melt sawing operation. A Y-12 Plant 1982 ALARA goal.** Beck, D.E.; West, C.M. (Oak Ridge Y-12 Plant, TN (USA)). Feb 1983. Contract W-7405-ENG-26. 27p. NTIS, PC A03/MF A01. Order Number DE83008707.

Lowering the uranium airborne contamination level at the two saws in the 9201-5 Arc Melt Area was chosen as a Y-12 Plant As-Low-As-Reasonably-Achievable (ALARA) goal for 1982. This priority was convincingly communicated to those involving by giving specific instructions to suspend saw operations any time there was evidence of a problem until that problem could be corrected. Using control charts on air flow rates into the saw enclosures and pressure drops across filters in the saw ventilation (Delta Phase I) exhaust system, it was possible to decide when filter changes or other adjustments were necessary to maintain the exhaust flow rates needed for improved airborne contamination control. The keeping of these charts, along with the actions taken on the basis of the data gathered, made it possible to meet the goal of reducing airborne contamination levels in 1982, as compared with 1981, although production in the Arc Melt Area increased significantly. These data also showed that use of one brand of filter in the prefilter system resulted in the need to change filters more frequently than when another brand was used. This fact triggered an investigation which revealed the cause for the shorter useful life of that filter and a request that only specifically approved filters be purchased for use in this system. Use of these control data also made it possible to establish that the exhaust system operated more effectively without the Roto-clone hydrostatic pecipitators because exhaust air flow was increased without reduction in filter life.

21806 (NUREG—0837-V1-N3-N4) **NRC TLD (thermoluminescent dosimeter) direct radiation monitoring network. Technical progress report Jul-Dec 81.** Costello, F.; Thompson, T.; Cohen, L. (Nuclear Regulatory Commission, Washington, DC (USA)). May 1982. 178p. NTIS, PC A09/MF A01.

This report provides the status and results of the NRC Thermoluminescent Dosimeter (TLD) Direct Radiation Monitoring Network. It presents the radiation levels measured in the vicinity of NRC-licensed facility sites throughout the country for the second half of 1981.

21807 **Mica nuclear track filters.** Tress, G.; Khan, E.U.; Vater, P.; Werner, W.; Brandt, R.; Kadner, M.; Spohr, R. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

Mica nuclear track filters are produced by irradiation of mica with energetic heavy ions and subsequent etching. The properties of these filters and the air through-put up to 300°C are reviewed. At an industrial plant mica filters are used to filter < 350°C hot waste gas containing radioactive aerosols from the production of reactor fuel elements. After filtration the aerosol particles on the filters are examined by different methods for their properties.

21808 **Emission and ambient concentrations of longliving aerosol radionuclides at stade nuclear power plant.** Hollaender, W.; Mause, P.; Morawietz, G.; Pape, E.; Pohlmann, G. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

21809 **Aerosols in nuclear engineering.** Schikarski, W.O. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981). (In German)

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

Nuclear aerosols represent a three-phase, dynamic system of solid particles, droplets and gaseous compounds in a carrier gas, which rapidly changes its properties due to aerosol processes, external forces and geometric boundary conditions. Computer programs for description of the aerosol system have been developed showing sufficient agreement with experiments. Open questions concern the aerosol formation, form factors, certain aerosol processes as well as the aerosol chemistry. Due to the particular properties of nuclear aerosols it is necessary to develop chemically resistant and heat-proof separators (e.g. sand bed filters).

21810 **Characterization of nuclear fuel aerosol by sedimentation.** Pickering, S. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

The results obtained with the sedimentation counter showed that both the material composition and the porosity of nuclear fuel pellets were important parameters on which both the amount of aerosol and the variation of MMAD under different generating conditions depended. This work will be continued with the aim of relating these dependences to specific mechanical properties of the materials.

21811 **Studying a hot particle with radiological methods.** Maschek, I.; Csepregi, T. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981).

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

Discussion was reported on the investigation of environmental single hot particle captured onto aerosol filter. Fission nuclides identified by gamma spectrometric analysis provided the time of origin of particle, which corresponded to the date of a recent atmospheric nuclear test of 16 October, 1980. The sole presence of hot particle on the filter was registered with autoradiographs. In addition, by means of Energy Dispersive X-ray Microanalysis the particle size could be measured about micrometer. The applied methods are adequate to make a distinction on radioaerosols released by nuclear reactor and originated from an explosion.

21812 **Resuspension of cerium-IV-oxide powder aggregates and measurement of their mass distribution.** Seehars, D.; Hochrainer, D. pp vp of Aerosols in science, medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981). (In German)

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

Expansion and release experiments with radioactive materials such as PuO_2-powder in order to evaluate the potential environmental exposure due to accidental release, i.e. by fire, are impossible for safety reasons. Such experiments can therefore only be performed by means of an inert model powder. This report deals with the experience gained with the model powder CeO_2. There are the two following reasons for choosing CeO_2: This compound is of high thermal stability, it is one of those oxides that melt at high temperatures; and Ce has a certain 'chemical resemblance' with plutonium, both metals form similar compounds with a number of elements.

5004 Thermal Effluents Monitoring And Transport

21813 **(ORNL/TM—8603) Meteorological effects of thermal energy releases (METER) program. Progress report, October 1980-September 1982.** Patrinos, A.A.N.; Hoffman, H.W. (comps.). (Oak Ridge National Lab., TN (USA)). Mar 1983. Contract W-7405-ENG-26. 98p. NTIS, PC A04/MF A01. Order Number DE83008313.

This report examines the inadvertent weather modification effects of large cooling towers and cooling ponds. Emphasis was placed on field studies, and the focus of the program was on a precipitation modification study around the Bowen Electric Generating Plant in northwestern Georgia. The field effort includes the study of wetfall chemistry in the plant's vicinity. The analysis of three years of precipitation data have failed to show a significant effect of the plant on rainfall volume; the investigation of rainfall pattern variability has been inconclusive. The studies of wetfall chemistry have provided valuable information on the mechanisms of plume washout from large point sources and on the general characteristics of precipitation chemistry in the southeastern US.

21814 **(SFB—80/E/214) Experimental investigation of cooling tower plumes. Pt. 1.** Andreopoulos, J. (Karlsruhe Univ. (T.H.) (Germany, F.R.). Sonderforschungsbereich Ausbreitungs- und Transportvorgaenge in Stroemungen). Jun 1982. 41p. Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe (Germany, F.R.).

Extensive measurements were made of the velocity field of a non-buoyant plume issuing from a cylindrical pipe perpendicularly into a uniform cross stream. A home-made subminiature triple hot-wire probe has been used in the measurements which include the three mean velocity components, all the Reynolds stresses as well as the triple products occuring in the Reynolds stress transport equations. The cross flow causes the plume to bend towards the downstream direction and produces behind the cylinder a strongly turbulent wake which in turn interacts with the plume. This interaction, together with the extra rates of strain due to streamline curvature and lateral convergence/divergence makes the flow very complicated. The turbulence level in the wake is much higher than in the plume and reaches a maximum four diameters downstream before it starts to decay. At ten diameters downstream the longitudinal mean velocity profile is monotonic while turbulence diffusion is negligible.

From Carbon dioxide research conference: carbon dioxide, science and consensus; Berkeley Springs, WV, USA (19 Sep 1982).

An overview of the project is presented. Specific topics receiving assistance are developing better monitoring methods for spatial and temporal distribution; analysis to determine sources and sinks; and greenhouse effect in actuality and forecast. Interdisciplinary relationships are considered. (PSB)

21817 **(EPA—450/3-80-007b) Surface coating of metal furniture - background information for promulgated standards.** (Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards). Oct 1982. 50p. NTIS, PC A03/MF A01.

Under the authority of Section III of the Clean Air Act, proposed standards were published in the Federal Register (45 FR 79390) with a request for public comment. A public hearing was held on January 9, 1981, and four speakers presented comments on the proposed standards. A total of ten commenters representing industry, trade associations, and a State air pollution control agency submitted written comments during the comment period. Their comments and EPA's responses are summarized in this document. The summary of comments and responses serves as the basis for the revisions that have been made to the proposed standards.

21818 **(NP—3900019) Relation between the Federal Law on Immission Control and the Private Neighbours Law.** Lorentz, H. (Mainz Univ. (Germany, F.R.). Fachbereich Rechts- und Wirtschaftswissenschaften). 15 Feb 1980. 284p. (In German). NTIS (US Sales Only), PC A13/MF A01. Order Number DE83900019.

Thesis.

The author shows the changes in the relation between Public and Private Neighbours Law caused by the Law on Immission Control. Those plants emitting in sovereignty are subject only to the public jurisdiction in regard to the procedural and material law. Also the task - in former times incumbent on property protection under civil law - to protect the individual against immissions has shifted to the public law. The author has the opinion that this task has actually been 'absorbed' by the public legal neighbour protection as a more current regulation. The most important reasons for this are that on the one hand the subjective public neighbours protection against plants requiring permission were extended and on the other hand that the range of civil protection is essentially included in the subjective public neighbours protection.

21819 **(PB—82-240318) Preliminary assessment of adverse health effects from carbon monoxide and implications for possible modifications of the standard.** (Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards). 1 Jun 1979. 37p. NTIS, PC A03/MF A01.

The purpose of this paper is to evaluate the key studies in the EPA document, Air Quality Criteria for Carbon Monoxide, and identify the critical elements to be considered in the possible revision of the primary carbon monoxide (CO) National Ambient Air Quality Standard (NAAQS). The paper also identifies critical factors that must be considered in selecting an adequate margin of safety for the CO air quality standard.

21820 **(PB—82-240326) Environmental impact assessment of control measures required for attainment of the national ambient air quality standard for ozone.** (Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards). Jun 1978. 19p. NTIS, PC A02/MF A01.

The purpose of this assessment is to review the information presented in Air Quality Criteria for Ozone and other Photochemical Oxidants and Control Techniques for Hydrocarbons and Volatile Organic Compounds and to present an analysis of the environmental impact of control measures required for attainment of the air quality standard for ozone.

21821 **(PB—82-240615) Example Scope of Work for contracts to prepare SIP revisions to attain and maintain NAAQS. Guideline series.** Tyler, D.D. (Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards). 5 Nov 1976. 46p. (OAQPS—1.2-068). NTIS, PC A03/MF A01.

This example Scope of Work is intended to show what tasks should be considered in preparing contracts to develop SIP revisions for attainment and/or maintenance of the NAAQS where the provisions of 40 CFR 51 Subpart D apply. The tasks and procedures described in this example are based on 40 CFR Part 51 regulations, with emphasis on the provisions of Subpart D published May 3, 1976 (40FR 18382). Some of the individual tasks and procedures are not specifically required by the regulations, but are based on recommendations contained in the Air Quality Maintenance Guidelines or related guidelines.

21822 **(PB—82-241613) Guidelines for air quality maintenance planning and analysis. Volume 5: Case studies in plan development.** (Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards). Dec 1974. 155p. NTIS, PC A08/MF A01.

This document presents the digests of four full text trial Air Quality Maintenance Plans from San Diego, St. Louis, Baltimore, and Denver. The subjects covered in each trial are: characteristics of the study areas, intergovernmental cooperation, baseline emissions inventory, emissions projections, baseline air quality, air quality projections, selection of maintenance strategies, and legal authority. The trial AQMPs prepared during this study represent exercises to demonstrate administrative and technical procedures available and do not necessarily constitute final, acceptable plans.

21823 **(PB—82-242298) Vehicle refueling emissions seminar.** (American Petroleum Inst., Washington, DC). 5 Dec 1973. 106p. NTIS, PC A06/MF A01.

This seminar focuses on the overriding regulatory aspects of refueling vapor control in response to the Clean Air Act. There are discussions on the current status on research and control technology of refueling emissions, the implementation capabilities, both present and future, the recovery equipment available, and the future outlook. There is an overview of the consideration of controls. Photographs and charts included.

21824 **(PB—82-242447) Air quality non-attainment areas in Region V.** Dahl, C.L.; Soehngen, J.R.; Hamlin, C. (Envirodyne Engineers, Inc., St. Louis, MO (USA)). Jun 1982. 111p. NTIS, PC A06/MF A01.

This document illustrates the attainment/non-attainment designations for the five criteria pollutants (sulfur dioxide, total suspended particulates, ozone, carbon monoxide and nitrogen dioxide) for the states comprising USEPA - Region V (Illinois, Indiana, Michigan, Minnesota, Ohio and Wisconsin). The air quality designations detailed in these maps are based upon information available as of March, 1982. These attainment status designations are pursuant to the requirements of Section 107 of the Clean Air Act, as amended in 1977, and are codified in Subpart C of Part 81 of Chapter 1, Title 40, Code of Federal Regulations. For additional information regarding current air quality data, legal and procedural requirements for attainment/non-attainment areas, etc., the appropriate regional, state or local environmental agencies should be contacted.

21825 (CONF-8103155—, pp 65-90) **Pollutant uptake by plants.** Kloke, A. 1981. (In German). NTIS (US Sales Only), PC A06/MF A01.

From 17. meeting on municipal composts and food quality; Speyer, F.R. Germany (26 Mar 1981).

The uptake of pollutant elements from the ground increases with their concentration in the ground. As for the distribution of these elements in cereals, we can distinguish four groups: 1) Concentration in the crop higher than in the straw: Magnesium; 2) Equal concentrations in crop and straw: Zinc, manganese, copper, cobalt, selenium; 3) Lower concentrations in the crop than in the straw: Molybdenum, arsenic, lead, nickel, cadmium, mercury; 4) Concentration in the crop hardly changed with increasing concentration in the straw: Chromium, fluorine, vanadium. The degree of the cadmium uptake does not only depend on the plant species but it also changes with the variety and the line within one variety. The higher the soil acidity, the higher is the uptake of heavy metals, especially cadmium.

21826 **(DOE/EV/70272—T1) Carbon balance of world forests and their associated soils. Progress report, August 1, 1977-September 30, 1978.** Zinke, P.J. (California Univ., Berkeley (USA)). Dec 1978. Contract AT03-76EV70272. 11p. NTIS PCE04/MF $6.35. Order Number DE83005079.

An initial approach was made to the evaluation of total carbon storage in various soils of tropical and temperate forests. Data from published soils analyses related to soil surveys in various regions of the world were gathered, tabulated, and coded for computer analysis. Software programs were designed to tabulate, calculate carbon storages and aggregate data as cumulative probability distributions of soil storage of carbon expressed as weight of the element per square meter to a meter depth of soil.

21827 **(EPA—560/5-82-004) Chemicals identified in feral and food animals: a data base. Volume II. Records 533-1515. Second annual report, October 1982.** Cone, M.V.; Faust, R.A.; Baldauf, M.F. (comps.). (Oak Ridge National Lab., TN (USA)). Dec 1982. Contract W-7405-ENG-26. 400p. (ORNL/EIS—196-Vol.2). NTIS (US Sales Only). Order Number DE83006368.

A comprehensive data base of chemicals identified in feral and food animals has been established. This effort has grown out of the concern over continuing reports of toxic chemicals in human tissues and body fluids. Feral populations and food animals are regarded as indicators of environmental contamination and subsequent human body burden. This data file is a companion to Chemicals Identified in Human Biological Media, A Data Base, and follows basically the same format. Data were obtained primarily from the open literature through manual searches (retrospective to 1979). The data base contains information on 134 different substances.

21828 **(NP—3901010) Study of endogenous and exogenous influence on lead (Pb) and cadmium (Cd) content in muscles and organs of deer (Capreolus capreolus L.) and wild rabbit (Lepus cuniculus L.).** Schinner, W. (Giessen Univ. (Germany, F.R.). Fachbereich Veterinaermedizin und Tierzucht). 9 Mar 1981. 215p. (In German). NTIS (US Sales Only), PC A10/MF A01. Order Number DE83901010.

In 1977 and 1978, 140 roe deer, 9 red deer and 55 wild rabbits from estates in North Bavaria where relative little Pb and Cd was found and from an area with a lot of Pb and Cd had been examined in regard to their Pb- and Cd-contents in their kidneys, livers and muscles. The kidneys of the roe deers normally contained the highest contents of Pb and Cd, followed by the livers and at least by the muscles.

21829 **(PB—80-167034) Sensitivity of soil regions to acid precipitation.** McFee, W.W. (Purdue Univ., Lafayette, IN (USA). Dept. of Agronomy). Jan 1980. 189p. (EPA—600/3-80-013). NTIS.

Atmospheric deposition of acid and other materials may pose a significant threat to some soils and the ecosystems they support. The project objective was to develop maps of the eastern United States that delineate soil areas according to their expected sensitivity to the effects of acid precipitation. Four parameters are important in estimating soil sensitivity to acid precipitation: (1) the total buffering capacity or cation exchange capacity; (2) the base saturation; (3) the management system imposed on the soil; and (4) the presence or absence of carbonates in the soil profile. Cation-exchange capacity was chosen as the primary criterion for classifying the soil regions into non-sensitive, slightly sensitive, and sensitive areas. The North Central States were found to contain, generally, non-sensitive to slightly sensitive soils. The Northeastern States include large regions of slightly sensitive to sensitive soils, and the Central States feature large portions in the slightly sensitive category with varying degrees of inclusions. Maps of these distributions have been prepared for individual states and for the entire eastern United States.

21830 **(PB—82-219437) Power plant cumulative environmental impact report. Final report.** (Maryland Dept. of Natural Resources, Annapolis (USA). Power Plant Siting Program). Feb 1982. 354p. NTIS, PC A16/MF A01.

This report presents the results of studies conducted by the Power Plant Siting Program (PPSP) to determine the cumulative impact of power plants on Maryland's environment. Included in this report are: (1) current and projected power demands and consumption in Maryland; (2) current and planned power generation; (3) air impacts; (4) aquatic effects; (5) radiological effects; (6) social and economic considerations; (7) noise impacts; (8) groundwater effects; (9) solid waste management concerns; (10) transmission line impacts; and (11) descriptions of cooling towers in Maryland. Also contained is the 1982 Ten Year Plan of Maryland Electric Utilities.

5103 Radioactive Materials Monitoring And Transport

REFER ALSO TO CITATION(S) 19829, 19879, 19883, 19884, 19885, 19889, 19890, 19894, 21587, 21761, 21797, 21799, 21830, 21871, 21935, 21958

21831 **(DOE/EP—0038/1) Summary of annual environmental reports for CY 1981: Department of Energy nuclear sites.** (USDOE Assistant Secretary for Environmental Protection, Safety and Emergency Preparedness, Washington, DC. Office of Operational Safety). Dec 1982. 52p. NTIS, PC A04/MF A01. Order Number DE83008175.

During CY 1981, radiation exposures to off-site populations from Department of Energy (DOE) nuclear facilities were well within regulatory limits. The maximum reported individual whole body dose to any member of the public from any DOE site was 15 mrem for the year. This can be compared to the 130 mrem average background exposure received each year by an individual living in the United States (EPA 1977). The total population dose received by individuals living within an 80-km (50-mi) radius of these sites was 230 man-rem from DOE operations, compared to a total of nearly eight million man-rem to the same populations from natural sources. Nonradiological releases in site effluents were generally within prescribed regulatory limits, with several facilities having pollution abatement projects planned or under construction to correct noncompliance conditions. Inadvertent releases of radioactive and nonradioactive pollutants had no significant health or ecological impacts.

21832 **(EML—412) Environmental Measurements Laboratory. Environmental report, March 1-September 1, 1982.** Hardy, E.P. Jr. (Department of Energy, New York (USA). Environmental Measurements Lab.). 1 Nov 1982. 285p. NTIS, PC A13/MF A01. Order Number DE83005501.

This report presents current information from the EML environmental programs, the Radiological and Environmental Research Division at Argonne National Laboratory and the National Radiation Laboratory of the New Zealand Department of Health. Annual summaries of strontium-90 in New York and San Francisco diets and human bone are presented in the initial section. The second section presents recent data from EML programs: quarterly strontium-90 deposition, radioactivity in the lower stratosphere, strontium-90 in New York and San Francisco diet, milk and tap water, and cesium-137 in tap water. The third section presents data from Argonne National Laboratory on cesium-137 in Chicago food and from the National Radiation Laboratory in New Zealand on environmental radioactivity. A bibliography of recent publications related to environmental studies is presented in the fourth section. Six of the sections have been abstracted and indexed individually for EDB/ERA/INS.

21833 (EML—412, pp I.3-I.20) **Strontium-90 in the diet: results through 1981.** Klusek, C.S. (Environmental Measurements Lab., New York, NY). 1 Nov 1982. NTIS, PC A13/MF A01.

In Environmental Measurements Laboratory. Environmental report, March 1-September 1, 1982.

Estimates of ^{90}Sr intake via the total diet in New York City and San Francisco have been made since 1960 from quarterly food samplings and average consumption statistics. The dietary intakes of ^{90}Sr have decreased from the maximum levels attained during 1963-1964, but the declines have become more gradual in recent years due to the continuing small amounts of ^{90}Sr deposition and the little-changing cumulative deposit of ^{90}Sr in soil. The annual intake in 1981 averaged 6.0 pCi/day (0.22 Bq/day) in New York, unchanged from the previous year, and 2.4 pCi/day (0.088 Bq/day) in San Francisco, slightly lower than the results of the previous year. Further gradual reductions in ^{90}Sr intake are anticipated during 1982.

21834 (EML—412, pp I.21-I.34) **Strontium-90 in human bone: 1981 results for New York City and San Francisco.** Klusek, C.S. (Environmental Measurements Lab., New York, NY). 1 Nov 1982. NTIS, PC A13/MF A01.

In Environmental Measurements Laboratory. Environmental report, March 1-September 1, 1982.

Results are presented of determinations of Sr-90 content of 102 specimens of vertebrae obtained during 1981 in New York City and San Francisco. The average Sr-90 to Ca ratios for adult vertebrae are 0.95 pCi/g Ca (0.037 Bq/g Ca) in New York and 0.61 pCi/g Ca (0.023 Bq/g Ca) in San Francisco, little changed from the average values of the previous year. Average Sr-90 concentrations in children's bone are now little different from the adult values. A two compartment bone model, which accounts for both short and long term retention of Sr-90 in bone, is used to describe the variations of Sr-90 content of bone and provide correlation with dietary Sr-90 intake. Regression analysis of the 21 years of survey data provides values of the relative retention of dietary Sr-90 and the effective bone turnover rates. The bone model gives satisfactory description of observed Sr-90 levels and allows reliable assessment of the long-term behavior of Sr-90 in man.

21835 (EML—412, pp II.185-II.198) **Radiostrontium in milk and tap water.** 1 Nov 1982. NTIS, PC A13/MF A01.

In Environmental Measurements Laboratory. Environmental report, March 1-September 1, 1982.

The New York City sample is a monthly composite of pasteurized milk purchased week days at retail stores. The monthly Sr-90 to calcium ratios for New York City since the inception of the sampling program are presented. In the monitoring of Sr-90 and Cs-137 in New York City tap water, samples were taken daily so that by the end of the month, approximately 100 liters were collected. The Sr-90 data since the inception of the program are presented. The available cesium-137 data expressed as the Cs-137 to Sr-90 ratio are also tabulated. Tap water sampling and analysis were terminated in October 1981.

21836 (EML—412, pp III.3-III.6) **Cesium-137 in various Chicago foods: (collection month, April 1982).** Karttunen, J.O. (Argonne National Lab., IL). 1 Nov 1982. NTIS, PC A13/MF A01.

In Environmental Measurements Laboratory. Environmental report, March 1-September 1, 1982.

Since April 1961, the ^{137}Cs and potassium content of the Chicago portion of the Tri-City Diet Sampling program has been determined in bulk food samples by gamma-ray spectrometry using a 4" x 4" NaI (Tl) crystal. Each variety of food (all fresh vegetable, all fresh fruit, etc.) is composited before measurement, and each sample is counted 400 to 1000 minutes. From each measurement composite daily and yearly food intakes are obtained. The results for the April 1982 semi-annual sampling are tabulated.

21837 (INIS-mf—7499, pp v) **Study of natural gamma background from geological ground rock in Central Slovakian Region.** Cajda, I. (Krajska Hygienicka Stanica, Oddelenie Hygieny Ziarenia, Banska Bystrica (Czechoslovakia)). 1980. (In Slovak). .

From 10. radiation hygiene days conference; Vranov nad Dyji, Czechoslovakia (7 Oct 1980).

Published in summary form only.

21838 (NUREG—0837-V1-N4) **NRC TLD direct radiation monitoring network: Progress report, October-December 1981. Technical report.** Costello, F.; Thompson, T.; Cohen, L. (Nuclear Regulatory Commission, King of Prussia, PA (USA). Region I). Jun 1982. 173p. NTIS, PC A08/MF A01.

The report provides the status and results of the NRC Thermoluminescent Dosimeter (TLD) Direct Radiation Monitoring Network. It presents the radiation levels measured in the vicinity of NRC licensed facility sites throughout the country for the fourth quarter of 1981.

21839 (NUREG/CP—0039, pp P.1-P.50) **Off-site dose calculations.** Eckerman, K.F. (Oak Ridge National Lab., TN). Dec 1982. NTIS, PC A99/MF A01.

From Health physics summer school on selected topics in reactor health physics; Lexington, KY, USA (14 Jun 1981).

Each stage of the nuclear fuel cycle involves some release of waste radionuclides to the environment. The role of numerical modeling in assessing the environmental impact of these releases has increased in recent years due to the complexity of the issues involved: potential health effects, economics, and in some cases, the welfare of unborn generations. These issues require evaluation and examination in a systematic, reproducible manner. The objective of numerical modeling is to provide the decision maker with a synthesis of knowledge from many disciplines organized in a logical and coherent fashion. In a more limited application, radiological modeling is used to assess whether a proposed facility is designed in a manner to be operated within existing regulatory requirements or whether an operational facility is in compliance with regulatory requirements. This paper summarizes the present role of modeling for such decisions.

21840 **Iodine-129 in rabbit thyroids near a nuclear fuel reprocessing plant in Idaho.** Fraley, L. Jr.; Bowman, G.C. (Colorado State Univ., Fort Collins (USA). Dept. of Radiology and Radiation Biology); Markham, O.D. (Department of Energy, Idaho Falls, ID (USA). Idaho Operations Office). *Health Physics;* **43**: No. 2, 251-258(Aug 1982).

The ^{129}I/^{127}I atom ratios in rabbits collected on the INEL site were larger than ratios in rabbits from a control area. Maximum ^{129}I/^{127}I atom ratios (9.1×10^{-4}) occurred near the Idaho Chemical Processing Plant (ICPP). Based on rabbit thyroid concentrations, the ^{129}I appeared to be deposited primarily in the direction of the predominant winds from the ICPP, northeast and southwest. Dose rates from the ^{129}I to thyroids of INEL rabbits varied from 0.1 to 260 μGy/y (0.01 to 26 mrad/y). Iodine-129 atmospheric releases from the ICPP appeared to have increased the ^{129}I/^{127}I atom ratios on and near the INEL site.

21841 **Influences of pH, temperature, and moisture on gaseous tritium uptake in surface soils.** Fallon, R.D. (Savannah River Lab., Aiken, SC). *Applied and Environmental Microbiology;* **44**: No. 1, 171-178(Jul 1982).

In South Carolina surface soils, the uptake of gaseous tritium (T_2, HT, or both) showed a broad optimal temperature response from about 20 to 50°C, with the highest rates at 35 to 45°C. The optimal pH was in the range of 4 to 7. Uptake rates declined at the wet and dry extremes in soil moisture content. Inhibition seen upon the addition of hydrogen or carbon monoxide to the soil atmosphere suggested that hydrogenase may be responsible for T_2-HT uptake in soil. During the period of most rapid recovery in a 36-day incubation of reinoculated, sterilized soil, T_2-HT uptake rates doubled every 2 to 4 days. Thus, T_2-HT uptake appears to be biologically mediated. Soil uptake of T_2-HT was not severly limited by pH, temperature, or moisture in the soils tested. Thus, rapid exchange of gaseous tritum into soil water must be expected and accounted for in modeling the isotope distributions around nuclear facilities.

5105 Site Resource And Use Studies

REFER ALSO TO CITATION(S) 19597, 19859, 19860

21842 (E—82-10247) **LANDSAT remote sensing: observations of an Appalachian mountaintop surface coal mining and reclamation operation.** (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). Oct 1979. 7p. (NASA-TM—84194). NTIS, PC A02/MF A01.

REF Original contains color imagery. Original photography may be purchased from the EROS Data Center, Sioux Falls, S.D. 57198 Original contains color illustrations ERTS.

The potential benefits of using LANDSAT remote sensing data by state agencies as an aide in monitoring surface coal mining operations are reviewed. A mountaintop surface mine in eastern Kentucky was surveyed over a 5 year period using satellite multispectral scanner data that were classified by computer analyses. The analyses were guided by aerial photography and by ground surveys of the surface mines procured in 1976. The application of the LANDSAT data indicates that: (1) computer classification of the various landcover categories provides information for monitoring the progress of surface mining and reclamation operations, (2) successive yearly changes in barren and revegetated areas can be qualitatively assessed for surface mines of 100 acres or more of disrupted area, (3) barren areas consisting of limestone and shale mixtures may be recognized, and revegetated areas in various stages of growth may be identified against the hilly forest background.

21843 (LA—9576-MS) **Vegetational analysis of a canyon ecosystem at Los Alamos.** Foxx, T.S.; Tierney, G.D. (Los Alamos National Lab., NM (USA)). Nov 1982. Contract W-7405-ENG-36. 28p. NTIS, PC A03/MF A01. Order Number DE83008277.

The floristic composition of the area immediately below a peregrine falcon nesting site was determined. The objective was to determine if any plants found within the disturbed area were key food species for either doves or rodents. Mourning doves are frequent prey of the peregrine and rodents attract owls that are occasional predators on the falcons. (ACR)

21844 (PB—82-214008) **Notification of hazardous waste sites required under Section 103(c) of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980: EPA region 2.** (Environmental Protection Agency, Washington, DC (USA)). Mar 1982. 311p. NTIS, PC A14/MF A01.

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980 PL 96-510 (commonly known as Superfund) mandates in Section 103(c) that certain persons notify the U.S. Environmental Protection Agency (EPA) by June 9, 1981 of the existence of sites where hazardous wastes from industries, businesses, government, hospitals, and other sources are stored, treated or disposed of. This document comprises a listing of 8,755 notifications of hazardous waste sites. For each notification, the listing summarizes the location, the persons required to notify, the amount and type of any hazardous waste to be found on the site reported, and any known or suspected releases of hazardous wastes. The CERCLA 103(c) notification was mandated to help EPA and State and local governments remedy problems created by uncontrolled hazardous waste disposal. This document contains ten volumes, one for each EPA region. Within each volume, the notifications are presented alphabetically by state and site name within each state, respectively.

21845 (PB—82-214016) **Notification of hazardous waste sites required under Section 103(c) of the CompRehensive Environmental response, Compensation and Liability Act (CERCLA) of 1980: EPA region 3.** (Environmental Protection Agency, Washington, DC (USA)). Mar 1982. 367p. NTIS, PC A16/MF A01.

The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980 PL 96-510 (commonly known as Superfund) mandates in Section 103(c) that certain persons notify the U.S. Environmental Protection Agency (EPA) by June 9, 1981 of the existence of sites where hazardous wastes from industries, businesses, government, hospitals, and other sources are stored, treated or disposed of. 21848 (PB—82-927905) **Maps: Poland, Eastern Europe: major power facilities.** (Central Intelligence Agency, Washington, DC (USA)). Jun 1980. 6p. NTIS PC E02.

The document is a page-size map of Poland with populated places, administrative divisions, major transportation routes. Map no. 502800 has terrain shading, no. 502799 excludes terrain. Map scale is 1:4,700,000. Included are maps of Eastern Europe showing major power facilities and major gas facilities. Map scales of Eastern Europe are 1:10,000,000.

21849 **(UCID—19680) Precision-leveling surveys near the Lawrence Livermore National Laboratory site (1969 through 1980).** Crow, N.B. (Lawrence Livermore National Lab., CA (USA)). 10 Feb 1983. Contract W-7405-ENG-48. 16p. NTIS, PC A02/MF A01. Order Number DE83007661.

Precision-leveling surveys near the Lawrence Livermore National Laboratory site were made by the California Department of Water Resources (1969 through 1980). Overall vertical motion was small. The data show that environmentally insiginificant subsidence occurred over the Livermore oil field, mostly before 1975. There is also evidence for a northerly tilt along the California aqueduct between 1978 and 1979. The magnitude of the tilt is small (about 1 cm) but consistent. The magnitude is relatively close to the inherent error of the measurements (about 4 mm), so that this interpretation must be treated with caution.

21850 **(USGS/MAP/L—133) Land use and land cover, 1978 Hot Springs, South Dakota, Nebraska.** (Geological Survey, Denver, CO (USA)). 1980. 8p. Geological Survey, Box 25286, Federal Center, Denver, CO 80225.

Land use and land cover of the area surrounding Hot Springs, South Dakota in 1978 is presented in map form. (ACR)

21851 (CONF-820970—, pp IV.3-IV.50) **West Antarctic ice sheet: diagnosis and prognosis.** Bentley, C.R. (Univ. of Wisconsin, Madison). Feb 1983. NTIS, PC A23/MF A01.

From Carbon dioxide research conference: carbon dioxide, science and consensus; Berkeley Springs, WV, USA (19 Sep 1982).

Field data from Antarctica strongly suggest that the ice sheet, if it is changing at all, is growing rather than shrinking. Evidence for this is particularly good in the Ross Sea and Pine Island Glacier drainage systems. The implication for the future is that from natural causes alone the ice shelf is more likely to increase in thickness than to decrease; in fact, there is a distinct possibility of a surging history and a present-day build-up towards a future surge. Furthermore, it appears that the ice shelf would be relatively invulnerable to the most direct effects of climatic warming: a temperature rise would take many hundreds of years to penetrate deeply into the shelf, and increased precipitation on the shelf can be expected to have only a minor effect. However, increased bottom melting could be much more effective: if there were to be an oceanic temperature increase of several degrees it is possible that a substantial thinning could occur in a hundred years. A maximum-reasonable-rate analysis of the problems relating to rapid evacuation of the large volume of West Antarctic ice leads to an estimate of 500 years for the minimum time required. It is concluded that the West Antarctic ice sheet is currently healthy and will probably be around for many centuries to come.

21852 **(DOE/EV/10250—1) Lagrangian and Eulerian diffusion study in the coastal surface layers. Final report, 1 July 1979-30 September 1982.** Okubo, A.; Carter, H.H.; Wilson, R.E.; Sanderson, B.G.; Partch, E.N. (State Univ. of New York, Stony Brook (USA). Marine Sciences Research Center). 1982. Contract AC02-79EV10250. 321p. NTIS, PC A14/MF A01. Order Number DE83007505.

This report provides details of the field studies, experimental results, and an analysis and discussion of both dye patch and plume experiments. The time rate of change of variance relative to the centroid for the dye patches and the time rate of change of variance, both relative and absolute, for the dye plumes are presented. For each drogue experiment, results are provided in terms of the time rate of change of the drogue cluster centroid, of the cluster variance and covariance and variance relative to the cluster principal axis, of the cluster rotation and elongation, of diffusivities, of velocity gradients and velocity gradient parameters, i.e., divergence, shear, vorticity, etc., and of the cluster areas both measured and predicted. Rotational invariants (rotary auto spectra and cross spectra) of the current meter records are presented as are mean values of the alongshore and on/offshore components of the current and horizontal and vertical velocity gradients.

21853 **(EPRI-EA—2059-Vol.2) Assessment methodology for new cooling lakes. Volume 2. Development of empirical multivariate relationships for evaluating fish communities in new cooling lakes. Final report.** Grieb, T.M.; Porcella, D.B.; Ginn, T.C.; Lorenzen, M.W. (Tetra Tech, Inc., Lafayette, CA (USA)). Feb 1983. 108p. NTIS, PC A06/MF A01. Order Number DE83901463.

Numerical classification techniques were used to define groups of lakes with distinct fish community attributes. Simple linear and multiple regression were then used to identify the important environmental variables affecting the fish communities. Next, the multivariate statistical technique of discriminant analysis was tested and shown to predict the groups of lakes (defined in the initial step of classification) using the identified environmental variables. Classification equations derived in the discriminant analysis enable the user to predict fish community characteristics of a new lake. The equations combine the information from nine limnological parameters into a single index of classification. Based on the value of this index, the lake is classified into one of four distinct groups. The fishery characteristics of the indicated group are then used to predict fish community structure and recreational fishery use. Angler-use estimates for the group are used to project multiple use benefits.

21854 **(N—8228688) Biota and biological principles of the aquatic environment.** Greeson, P.E. (Geological Survey, Washington, DC (USA)). 1982. 52p. (CIRC—848-A). NTIS, PC A04/MF A01.

The first of several compilations of briefing papers on water quality prepared by the U.S. Geological Survey is presented. Each briefing paper is prepared in a simple, nontechnical, easy to understand manner. This U.S. Geological Survey Circular contains papers on selected biota and biological principles of the aquatic environment. Briefing papers are included on Why biology in water quality studies , Stream biology, Phytoplankton, Periphyton, Drift organisms in streams, Family Chironomidae (Diptera), Influences of water temperature on aquatic biota, and Stream channelization: Effects on stream fauna.

21855 **(TVA/PUB—83/28) Optimization of biological recycling of plant nutrients in livestock waste by utilizing waste heat from cooling water.** Maddox, J.J.; Behrends, L.L.; Burch, D.W.; Kingsley, J.B.; Waddell, E.L. Jr. (Tennessee Valley Authority, Muscle Shoals, AL (USA). Div. of Agricultural Development). May 1982. 155p. (EPA—600/7-82-041). NTIS, PC A08/MF A01. Order Number DE83901674.

Results are presented from a 5-year study to develop aquatic methods which beneficially use condenser cooling water from electric generating power plants. A method is proposed which uses a system for aquatic farming. Livestock waste is used to fertilize planktonic algae production and filter-feeding fish are used to biologically harvest the algae, condenser cooling water (simulated) is used to add waste heat to the system, and emergent aquatic plants are used in a flow through series as a bio-filter to improve the water quality and produce an acceptable discharge. Two modes of operation were tested; one uses untreated swine manure as the source of aquatic fertilizer and the other uses anaerobic digester waste as a means of pretreating the manure to produce an organic fertilizer. A set of operating conditions (temperature, retention time, fish stocking rate, fertilizer rates, land and water requirements, suggested fish and plant species, and facility design) were developed from these results. The integrated system allows continual use of power plant condenser cooling water from plants in the southeastern United States.

5202 Chemicals Monitoring And Transport

The third in a series of tracer measurements of overwater transport and diffusion has been completed. This report includes the meteorological data obtained aboard the RV/Acania. Analyses of radiosonde data to yield mixed layer parameters for mixed layer assessment is also included.

21857 (CONF-820970—, pp II.123-II.145) **Geographical, seasonal, and secular variations of the partial pressure of CO_2 in surface waters of the North Atlantic Ocean: the results of the North Atlantic TTO Program.** Takahashi, T. (Columbia Univ., Palisades, NY); Chipman, D.; Volk, T. Feb 1983. NTIS, PC A23/MF A01.

From Carbon dioxide research conference: carbon dioxide, science and consensus; Berkeley Springs, WV, USA (19 Sep 1982).

Measurements of the partial pressure of CO_2 in surface water made during the seven-month long Transient Tracers in Oceans Expedition in the North Atlantic (TTO/NA), April-October 1981, are summarized to show the geographical, seasonal, and secular variations in surface water pCO_2. The pCO_2 and temperature data show four distinct trends, each characteristic of the surface ocean circulation regimes. A systematic trend of 4.3%pCO_2/°C is observed in the Norwegian-Greenland Sea and in the Labrador Sea. On the other hand, in the Sargasso Sea and in the area of the Antilles Current, another systematic trend of 1.2%pCO_2/°C is observed. The seasonal variations in pCO_2 and tempertaure observed at three geographical locations appear to be consistent with this trend. These pCO_2-temperature relationships are a manifestation of complex interactions between various oceanographic processes, such as CO_2 gas exchange between air and sea, mixing depth of surface layer, upwelling of deep waters, biological activities and seasonal temperature changes in surface water. Progress made to date for understanding of the origin of these relationships is discussed.

21858 (ESA-SP—167) **Application of remote sensing data on the continental shelf: proceedings of an EAREL-ESA symposium.** Longdon, N.; Levy, G. (European Space Agency, 75 - Paris (France)). Jul 1981. 298p. NTIS, PC A13/MF A01.

A symposium which studied the application of remote sensing techniques to oceanography, fishing, pollution monitoring, and coastal zone management is reported. National programs, operational requirements, and state of the art are reviewed. The use of satellites, including LANDSAT, Seasat and ERS is highlighted.

21859 (Juel-Spez—163) **Methods for the ecotoxicological evaluation of chemicals. Vol. 1.** Biehl, H.M.; Fuehr, F.; Seibert, K. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.)). Jul 1982. 153p. (In German). NTIS (US Sales Only), PC A08/MF A01. Order Number DE83750300.

In 8 research reports test methods are presented, which deal with the degradation potential, accumulation and effects of chemicals in the aquatic environment. These projects had been carried out in the frame of the program 'Methods for the ecotoxicological evaluation of chemicals' financed by the Federal Minister for Research and Technology since 1978. The degradation behaviour under aerobic and unaerobic conditions, the bioaccumulation and elimination and sublethal effects of chemicals on different aquatic organisms were studied in detail. Moreover the usefullness of artifical ponds for ecotoxicological testing of chemicals had been examined. To check the scope of the test methods and to guarantee the comparability of the results, reference-chemicals had been introduced in nearly all projects.

21860 (Juel-Spez—163, pp 8-19) **Investigations with respect to a test system for biodegradability evaluations under the aspects of surface waters and sewage treatment plants.** Fischer, W.K.; Gerike, P. Jul 1982. (In German). NTIS (US Sales Only), PC A08/MF A01.

In Methods for the ecotoxicological evaluation of chemicals. Vol. 1.

In the course of this project the following aspects were treated: - Three carbon analyzers were investigated with respect to correctness, reproducibility and sensitivity. It was shown, that biodegradability evaluations in the OECD Screening Test are analytically possible with starting concentrations corresponding to >= 5 mg/l C. - A procedure for the Modified OECD Screening Test was made available. Since the test will be part of annex V of the sixth amendment to the 1967 directive (i.e., the European Chemicals Law) the procedure is presently being worked over editorially within the EEC. As a part of this project the test was evaluated with respect to reproducibility. Although it is not optimal yet from a purely statistical viewpoint, it proved adequate for the intended purpose of determining 'ready biodegradability'. - Besides the Modified OECD Screening Test seven other important biodegradability tests were characterized with respect to their relevance on the ground of the results obtained with 44 compounds. The division of the tests into those for 'ready' and 'inherent biodegradability' and simulation tests as it has been recommended by the OECD Expert Group 'Degradation/Accumulation' is based on this correlation study.

21861 (Juel-Spez—163, pp 111-126) **Studies of sorption and remobilization of chemicals in artificial and natural sediments.** Bibo, J.; Mueller, G. Jul 1982. (In German). NTIS (US Sales Only), PC A08/MF A01.

In Methods for the ecotoxicological evaluation of chemicals. Vol. 1.

Within the framework of the present experimental series it was attempted to determine the geo- and bioaccumulation behaviour of Benzopyrene in order to estimate the corresponding rates of concentration. The geoaccumulation behaviour was investigated in adsorption and desorption experiments on various clay minerals and natural sediments. Adsorption data gained are well described by Freundlich adsorption isotherms. The Ksub(f) values lay between 209 (quartz) and 1170 (sediment from a clay pit). A significant dependence of adsorption and desorption isotherms on sediment parameters could not be determined. The adsorption processes are subject to an entropic effect that is influenced by the solution characteristics. So-called 'hydrophobic bonding' is the result. In bioaccumulation experiments the transfer of Benzopyrene from contaminated sediment into sediment-living organisms (Tubificidae) was investigated. The factors of transfer thus determined were in the range of 1. Major factors influencing the accumulation of Benzopyrene in tubificidae included temperature and the type of sediment. There was insufficient evidence to indicate that the uptake processes occurred from Benzopyrene concentrations in interstitial water; mobilization processes from sediment during intestinal passage probably played a role, but this has not been clearly defined.

21862 (Juel-Spez—163, pp 127-153) **Studies of using artificial ponds for ecotoxicological examination of chemicals.** Hansen, P.D. Jul 1982. (In German). NTIS (US Sales Only), PC A08/MF A01.

In Methods for the ecotoxicological evaluation of chemicals. Vol. 1.

Investigations on how to provide ecosystems in artificial ponds were carried out. The ponds were filled with water of different origin and composition. The species and numbers of the plankton organisms in the artificial ponds were determined. Experiments were carried out to ensure equal growing rates and comparable variations of the species in the ponds (volume=10 m^3). The composition and numbers of the plankton species were dominated by the green algae. The zooplankton and the plankton species in general were very poor. It was confirmed that the biocoenosis of the plankton organisms in artificial ponds could be a tool for ecotoxicological testing of chemicals under field situations. Criteria for the suitability are discussed. The studies on the basis of the present results, should be continued in stabilized ecosystems; further experiments are proposed.

21863 **(PB—83-118026) Report to the congress on ocean pollution, monitoring and research October 1980 through September 1981.** (National Oceanic and Atmospheric Administration, Rockville, MD (USA)). Jul 1982. 60p. NTIS, PC A04/MF A01.

This report summarizes the results of FY 1981 National Oceanic and Atmospheric Administration (NOAA) monitoring and research efforts under Title II of the Marine Protection, Research, and Sanctuaries Act of 1972 (P.L. 92-532). Section 201 of Title II assigns responsibility to the Department of Commerce for a comprehensive and continuing program of monitoring and research regarding the effects of dumping material into ocean waters, coastal waters, and the Great Lakes. Section 202 of Title II directs the Secretary of Commerce, in consultation with other appropriate parts of the U.S. Government, to 'initiate a comprehensive and continuing program of research with respect to the possible long-range effects of pollution, overfishing, and man-induced changes of ocean ecosystems.' The legislation also directs the Secretary of Commerce to report the findings from the monitoring and research programs to the Congress at least once a year. There are intrinsic difficulties, however, in distinguishing 'long-range' effects from the 'acute' effects of ocean dumping, or more generally of marine pollution. In response to these considerations and to the responsibilities assigned to NOAA under the National Ocean Pollution Planning Act (P.L. 95-273), NOAA has consolidated and coordinated its research efforts in these areas to make the overall program more cost-effective and productive.

21864 **(PB—80132004) Probable effects of acid precipitation on Pennsylvania waters.** Arnold, D.E.; Light, R.W.; Dymond, V.J. (Pennsylvania State Univ., University Park (USA). Pennsylvania Cooperative Fishery Research Unit). Jan 1980. 31p. (EPA—600/3-80-012). NTIS.

The purpose of this project was to search for and identify any trends in water chemistry and fish communities in Pennsylvania waters which would indicate that acid precipitation was affecting them adversely. No new data collection was to be included. Five existing data bases, including original data collected by the authors, were examined for the existence of water analyses from the same or nearby locations separated by at least one year. (Analyses involving known or suspected influence of acid mine drainage were omitted.) Of 983 analysis reports which were usable, there were 314 cases with two or more such points. Of these 107 or 34% showed a decrease in pH, alkalinity, or both. Average decrease in pH was 0.4 units with a maximum case of 1.3 units. Average decrease in alkalinity was 15.1 mg/1 (as $CaCO_3$) with a maximum case of 105 mg/1. The average time span between earliest and latest sample was 8.5 years. When the data were separated by physiographic provinces, it became apparent that although the majority of the decreases occurred in streams on the relatively insoluble rocks of the Allegheny Plateau, there were also many cases in the ridge-and-valley province and other regions. Many of these decreases are to pH levels considered marginal for growth and reproduction of trout and other fishes. Seventy-one of the 107 analyses showing decreased pH or alkalinity included fish collection data. In 40 of these cases (58%), the number of fish species present decreased as well. This report was submitted in fulfillment of Contract Number B0835NAEX under the sponsorship of the U.S. Environmental Protection Agency. This report covers a period from May to October, 1979, and work was completed as of October 1, 1979.

21865 **(PNL-SA—10533) Illustration of environmental fate modeling on a micro-computer.** Peloquin, R.A. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76RL01830. 17p. (CONF-821173—1). NTIS, PC A02/MF A01. Order Number DE83007844.

From 3. annual meeting of the Society of Environmental Toxicology and Chemistry; Arlington, VA, USA (14 Nov 1982).

Mathematical models of ecosystems can be efficiently implemented on micro-computers. The advantages of using a micro-computer include greater convenience for the user and low capital and maintenance costs. This has been demonstrated by a computer program written for a micro-computer to implement a multi-compartmental pathway model. The eight compartment model simulates the fate of phenolics present in solvent-refined coal liquids when spilled into an aquatic environment. The computer code that implements the compartmental model was written in Microsoft BASIC-80 compiled under the CP/M operating system. The code can consequently be executed on any micro-computer which has sixty-five kilobytes of memory, 180 kilobytes of on-line storage, and operates under CP/M.

21866 **Spreading-boiling model for instantaneous spills of liquefied petroleum gas (LPG) on water.** Chang, H.R.; Reid, R.C. (Massachusetts Inst. of Tech., Cambridge). *Journal of Hazardous Materials;* **7**: No. 1, 19-35(Nov 1982).

An experimental and theoretical investigation was carried out to study the boiling and spreading of liquefied petroleum gas (LPG) on water, in a one-dimensional configuration. Experimental work involved the design and construction of a spill/spread/boil apparatus which permitted the measurement of spreading and local boil-off rates. With the equations of continuity and momentum transfer, a mathematical model was developed to describe the boiling-spreading phenomena of cryogens spilled on water. The model accounts for a decrease in the density of the cryogenic liquid due to bubble formation. The boiling and spreading rates of LPG were found to be the same as those of pure propane. An LPG spill was characterized by the very rapid and violent initial boiling and highly irregular ice formation on the water surface. The measured local boil-off rates of LPG agreed well with theoretical predictions from a moving-boundary heat-transfer model. The spreading velocity of an LPG spill was found to be slightly less than predicted by the spreading model as the rough ice formed on the surface impeded the flow of the LPG.

21867 **Laboratory study of sulfuric acid spill characteristics pertaining to maritime accidents.** Tang, I.N. (Brookhaven National Lab., Upton, NY); Wong, W.T.; Munkelwitz, H.R.; Flessner, M.F. *Environmental Science and Technology;* **16**: No. 9, 587-593(Sep 1982).

Concentrated sulfuric acid and oleums are routinely transported in bulk quantities on U.S. and international waterways. It is conceivable that, in the event of an accident, an acid spill could occur with consequences detrimental to both man and the environment. In the present paper, several acid-spill scenarios are briefly described, and the results from laboratory experiments designed to simulate the two most important types of acid-spill accidents are reported. In the first case, the convective mixing of concentrated sulfuric acid with water is shown to be governed by the buoyancy force arising from changes in acid concentration and released heat of dilution. In the second case, experiments with oleums have resulted in the formation of dense clouds of acid aerosols well within the respirable particle size range.

21868 **Organic contaminants in groundwater near an underground coal gasification site in northeastern Wyoming.** Stuermer, D.H.; Ng, D.J.; Morris, C.J. (Lawrence Livermore Lab., CA). *Environmental Science and Technology;* **16**: No. 9, 582-587(Sep 1982). Contract W-7405-ENG-48.

Three groundwater samples collected near two underground coal gasification (UCG) sites 15 months after the end of gasification were analyzed for dissolved organic contaminants. The contaminants consisted of phenols, aromatic carboxylic acids, aromatic hydrocarbons, ketones, aldehydes, pyridines, quinolines, isoquinolines, and aromatic amines. Concentrations ranged up to about 50 ppm with large variations both in the relative concentrations of acidic, neutral, and basic constituents and in the concentrations of individual compounds. Naphthalene, o-xylene, 2-methylpyridine, and o-cresol were consistently present in high concentrations and were identified as UCG contaminant-indicator compounds that appear to be particularly useful for monitoring purposes. A simplified method of analysis for these compounds was developed.

21869 **Nature and distribution of organic matter in the surface sediments of world oceans and seas.** Premuzic, E.T.; Benkovitz, C.M.; Gaffney, J.S.; Walsh, J.J. (Brookhaven National Lab., Upton, NY). *Organic Geochemistry;* **4**: 63-77(1982). Contract AC02-76CH00016.

Existing data on the distribution of organic carbon and nitrogen in marine sediments have been analyzed in order to better understand the physical and chemical processes involved in this aspect of the global carbon cycle. Maps of the global distribution of organic carbon and nitrogen in the sediments of world oceans and seas are presented. Correlation analyses of the available information dealing with the distribution of marine sedimentary organic matter have revealed that in terms of bulk parameters (%C/sub Org/ and %N Kjeldahl), there is an apparent accumulation of organic matter on the continental slope (water column depth 200 to 2000 m). Specific interactions between clays and organic matter, although indicated in laboratory experiments, have not been detected by these analyses. 167 references.

(Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048887.

Maxima of - 88 discharge profiles 51 single chains 26 two-member chains 11 three-member chains;.

GETOUT is a set of four FORTRAN programs and associated subroutines developed as an aid to investigate the migration of radionuclide chains from an underground source. The model to be analyzed is an underground nuclear waste disposal site and a uniform one-dimensional soil column that connects the site with a surface water body. At an arbitrary time after the waste is deposited, the radioactive material is released to an underground aquifer which flows at constant velocity directly through the soil column into the surface water body. The program takes into account the complications introduced by the radioactive decay of first-order chains to produce other species which have different absorption characteristics and, in turn, decay at different rates.UNIVAC1100; FORTRAN; EXEC8; Program ONE requires 29,000 words of main memory and 205,000 words of direct access storage for execution. Programs TWO and THREE require 31,000 words of main memory and 86,000 and 47,000 words of direct access storage, respectively, and program FOUR requires 44,000 words of main memory and an additional 475,000 words of direct access storage for execution.

21871 (ENICO—1116-Suppl.1-12/82) **ICPP effluent monitoring report, December 1982.** Guinn, G.D. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Feb 1983. Contract AC07-79ID01675. 54p. NTIS, PC A04/MF A01. Order Number DE83008317.

A summary of the effluent monitoring program for December 1982 is presented. A summary of the total airborne, liquid and solid releases to date for CY-1982 is shown graphically. The concentration of nuclides released for December and CY-82 to date are tabulated and compared to the applicable DOE Radiation Concentration Guide (DOE 5480.1, Chapter XI, Attachment XI-1, Table II, Column 2). During December there were two inadvertent releases caused by accidental diversions of waste water. These releases resulted in large increases in SR-90 in service waste system. The concentration exceeded the RCG level for the month, but did not cause the annual average to exceed the RCG, which is an annual average release limit. The nonradioactive releases to the injection well during CY-1982 are tabulated. These nonradioactive releases are divided into four categories: inorganic chemicals, ions, organics, and water quality parameters.

21874 (NUREG—0868) **A collection of mathematical models for dispersion in surface water and groundwater.** Codell, R.B.; Key, K.T.; Whelan, G. (Nuclear Regulatory Commission, Washington, DC (USA)). Jun 1982. 280p. NTIS, PC A13/MF A01.

This report represents a collection of some of the manual procedures and simple computer programs used by the Hydrologic Engineering Section of the Division of Engineering, Office of Nuclear Reactor Regulation, for computing the fate of routinely or accidentally released radionuclides in surface water and groundwater. All models are straightforward simulations of dispersion with constant coefficients in simple geometries.

21875 **Four-year declines in radiocesium concentrations of American coots inhabiting a nuclear reactor cooling reservoir.** Brisbin, I.L. Jr.; Vargo, M.J. (Savannah River Ecology Lab., Aiken, SC (USA)). *Health Physics;* **43**: No. 2, 266-269(Aug 1982).

It was established that the amount of radioactive cesium in migratory waterfowl inhabiting a reactor cooling reservoir in South Carolina increased significantly between Sept - Dec 1971. A systematic resampling of the coots was undertaken during 1975-76 to determine changes in contamination levels over the intervening 4 yrs. Ducks were sampled, from the 3 arms of the reservoir each of which received different amounts of effluent. Factors affecting the radiocesium concentration were location, month and year of sampling. The spatial pattern of radiocesium distribution between coots from the 3 arms did not change over the 4 yrs period. There were indications that the radiocesium content decreased proportionally in coots from all 3 areas over the 4 yr period.

The species composition, distribution, and population dynamics of wood-boring bivalves are being studied in the vicinity of the Oyster Creek Nuclear Generating Station, Barnegat Bay, New Jersey. Untreated wood test panels are used to collect organisms at 12 stations. Physiological tolerances of 3 species are also under investigation in the laboratory. Competition among the species is being analyzed. In the fall of 1981, Teredo bartschi remained in Oyster Creek despite continuous prolonged outages of the Oyster Creek Nuclear Generating Station.

21877 (CNEN-RT/BIO—80/14) **Proposed classification of biotapological marine ecosystems off the coast of Italy. Part I.** Zurlini, G.; Bruschi, A.; Papucci, C.; Brondi, A. (Comitato Nazionale per l'Energia Nucleare, Rome (Italy). Direzione Centrale della Sicurezza Nucleare e della Protezione Sanitaria; Comitato Nazionale per l'Energia Nucleare, Fiascherino (Italy). Dipartimento Radiazioni e Ricerche di Sicurezza e Protezione; Comitato Nazionale per l'Energia Nucleare, Casaccia (Italy). Dipartimento Radiazioni e Ricerche di Sicurezza e Protezione). Dec 1980. 78p. (In Italian). Dep. NTIS (US Sales Only), MF A01. Order Number DE82902805.

The programming of environmental surveys represents the stage which mostly determines the reliability and representativity of results. A rational choice of the criteria of intervention as well as a suitable schedule of the operations must necessarily be supported with an adequate environmental understanding of the area taken in consideration. The risk involved by a lack of a good knowledge of the environment can be so far represented by redundancies and gaps of information provided by the surveys. One of the aspects to be mainly considered is the multiplicity of the marine environments occurring along the Italian coasts. Each marine environment shows features which, though specific, can be nevertheless classified into certain types. There are good reasons to believe that the problems raised by the marine contamination can have significative analogies within each environmental type. The aim of the biotapological classification of the coastal marine environments, herein proposed, is to allow, with a sufficiently wide grid, the identification of the main environmental types either by establishing a theoretical macrohabitat classification system, or by verifying the possibility of extrapolations from areas where a greater number of environmental informations is available.

21878 (PB—82-229550) **A study of the spatial variations in the non-tidal currents of the Upper Chesapeake Bay. Final report.** Grano, V.; Pritchard, D.W. (Johns Hopkins Univ., Shady Side, MD (USA). Chesapeake Bay Inst.). Jan 1982. 338p. NTIS, PC A15/MF A01.

Time series measurements were conducted of current velocity in order to develop the capability to predict currents from easily measured quantities (tidal heights, wind, atmospheric pressure), measurements were obtained from in situ recording cross-sections in the Upper Chesapeake Bay. During each one-month experimental period, 19 to 28 current meters were distributed on two of the four cross-sections to measure current velocity. Temperature, conductivity, salinity, fresh water inflow to the area, wind, and tidal heights data also were obtained. The study produced information on the spatial variations in the residual or non-tidal currents of the Upper Bay and related these variations to river inflow, density distribution, and wind velocity, both near-field and far-field.

21879 (PB—82-230772) **Lower Susquehanna River hydrographic and water quality study, Summer 1981: Volume I. Final report.** Potera, G.T.; Philipp, K.R.; Johnson, T.D.; Petrimoulx, H.J.; Klose, P.N. (Environmental Resources Management, Inc., West Chester, PA (USA)). 17 Mar 1982. 100p. NTIS, PC A05/MF A01.

This report presents a summary of field data collected for modeling simulations of the Susquehanna River. The modeling simulations are intended to provide information about the relationship of dissolved oxygen (DO) in the Conowingo Reservoir, and in the lower Susquehanna River, to the operation mode of the Conowingo Dam, in order to meet requirements of the operating license issued by the Federal Energy Regulatory Commission. The study objectives were to: (1) monitor water flow and DO flux in the Conowingo Reservoir, in the vicinity of Conowingo Dam and in the river downstream; (2) monitor wind-induced turnover events in the reservoir; (3) measure the effects of specific test discharges by the dam on local water flow characteristics, using current meter and dye measurements; (4) measure the flow characteristics of the river below the dam during unsteady flow conditions and during tests of feasible minimum discharges; and, (5) measure reaeration of the reservoir due to atmospheric oxygen diffusion.

21880 (PB—82-230780) **Lower Susquehanna River hydrographic and water quality study, Summer 1981. Volume 2: appendices. Final report.** Potera, G.T.; Philipp, K.R.; Johnson, T.D.; Petrimoulx, H.J.; Klose, P.N. (Environmental Resources Management, Inc., West Chester, PA (USA)). 17 Mar 1982. 112p. NTIS, PC A06/MF A01.

This report includes appendices to Volume 1, which presents field data on temperature and dissolved oxygen of the Conowingo Dam and the Conowingo Reservoir for use as input to modeling simulations of the Susquehanna River. The modeling simulations were designed to meet requirements of the operating license for Conowingo Dam issued by the Federal Energy Regulatory Commission. Appendices included are: (1) instrument specifications; (2) dye study: time of travel results; (3) dye study: nearfield study results - discrete releases; (4) dye study: nearfield study results - daily summaries; and (5) reaeration data.

21881 (PB—82-237199) **Characterization of LaVerkin Springs water and methods for its reuse in energy development.** Eisenhauer, R.J. (Bureau of Reclamation, Denver, CO (USA). Engineering and Research Center). Nov 1981. 23p. NTIS, PC A02/MF A01.

Analytical water data obtained from a 9-month test program at the LVS (LaVerkin Springs) site, which is located in Washington County, Southwestern Utah, were evaluated. Fresh water and the water after processing through various pretreatment steps and after ED (electrodialysis) desalting were characterized. Upgrading water quality by various physical and chemical treatment methods and by desalting processes was demonstrated by the LVS site test program. The relative merit of different methods of treatment, disposal, and reuse of LVS water were studied. The objectives of the study were to evaluate methods for preventing high salinity LVS water from entering the Virginia River and for utilizing the processed water in energy development. The disposal of water by (1) deep well injection, (2) use as a secondary coolant in a binary cooling tower, (3) use in solar salt-gradient ponds, and (4) use as a transport media for coal slurry pipelines were found to be technically feasible. Use of LVS water to transport coal to a consuming powerplant and subsequent reuse in a binary cooling tower and/or solar salt-gradient ponds would achieve both objectives of salt reduction and energy conservation. Because LVS water has a salt content of 9500 mg/L and a boron content of 5 mg/L, it cannot be directly used for irrigation.

21882 (PB—82-239716) **Two level multi-objective reconnaissance system study of a large water resource system. Doctoral thesis.** Chaube, U.C. (Indian Inst. of Tech., New Delhi). 1982. 295p. NTIS, PC A13/MF A01.

Reconnaissance study of a large water resource system involves analysis of subsystem characteristics and subsystem interlinkages in terms of total system development objectives. Linear optimization models are developed to represent, (a) aggregate temporal and spatial characteristics of the system (b) predominant policies namely irrigation and energy development and (c) the related issues and technological options, in physical terms. A large system is viewed in terms of several constituent subsystems in which Level-I study relates to irrigation and energy development. These Level-I and Level-II studies have been carried out in the context of developmental planning of Ganga basin. The basin is characterized by predominant agriculture based economy and temporal and regional heterogeneity in the resource availability and demand pattern. The study brings out relative impact of various issues on the irrigation and energy policies in planning subregions and trade-offs which would form the basis of further creative development and detailed systems analysis.

21883 (TVA/OECD/FPM—83/27) **Floods on North Toe River and Kentucky Creek in the vicinity of Newland, North Carolina. Flood report.** (Tennessee Valley Authority, Knoxville (USA). Office of Economic and Community Development). Dec 1982. 41p. NTIS, PC A03/MF A01. Order Number DE83901236.

This study provides floodplain information for the North Toe River and Kentucky Creek in the vicinity of Newland, North Carolina. The study was requested by the town of Newland to provide information reflecting current flood conditions in order for the town to better administer its floodplain management program. This investigation covers the North Toe River through the corporate limits of Newland from river mile 69.12 to mile 70.56 and Kentucky Creek from its mouth upstream to mile 0.53. A brief description of the North Toe River watershed and a flood history of Newland are included. Selected flood profiles and 100- and 500-year floodplain delineations for the streams studied are also provided. A proposed 100-year floodway is included as an appendix.

21884 **(PB—82-243601) UV disinfection for onsite sand filter effluent.** Lowery, J.D.; Romatzick, S. (Maine Univ., Orono (USA). Land and Water Resources Center). May 1982. 40p. NTIS, PC A03/MF A01.

The technical and economic feasibility of using ultraviolet (uv) light as a viable alternative to chlorine as the required disinfectant for onsite sand filter effluents discharged to surface waters in Maine was determined. To obtain a reliable cross section of performance for sand filters in Maine, 74 filters were selected for an effluent characterization program. The effluent characterization study allowed general conclusions to be made with regard to the potential of uv disinfection. A simple suspended lamp uv disinfection unit was designed, constructed, and tested in the laboratory and in the field. The efficiency of the uv disinfection unit was determined through field testing at 10 of the 74 sand filter sites used in the effluent characterization program.

21885 **(CONF-8209104—1) Management of social effects in oil-shale boomtowns.** Wernette, D. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 38p. NTIS, PC A03/MF A01. Order Number DE83007961.

From Annual meeting of the American Sociological Association; San Francisco, CA, USA (6 Sep 1982).

Concern with energy developments in rural sparsely populated areas has concentrated on two types of impacts: the increased employment of local workers, and the social and fiscal problems caused by rapid population growth due to in-migrant workers. Little work has been done to date to estimate the effectiveness of measures to manage these impacts to the benefit of the local population. Sensitivity analysis with a county-level computer simulation model is used to estimate the effectiveness of four growth management measures in this study. Two scenarios of oil-shale development in northwestern Colorado are used as the context for these measures. The two measures to increase local employment focus on training local workers in relevant skills, and on increasing the commuting of workers from adjacent counties. Neither of these measures has large effects on local employment because of the limited pool of local labor. The two measures to control population growth focus on reducing secondary local employment growth and lowering the average size of in-migrant workers' households. Neither of these measures produce large reductions in the rate of population growth. The construction of a new community appears more promising as an impact mitigation measure. These findings are limited in validity to very high growth scenarios for very isolated, sparsely populated areas. These growth management measures should be of greater value for lower growth scenarios and for more densely populated areas of the country.

21886 **(PB—82-206962) General design study of pilot VOC control units.** Henke, C.B.; Key, J.A.; Parmele, C.S.; Basdekis, H.S. (IT-Enviroscience, Knoxville, TN (USA)). Apr 1981. 85p. NTIS, PC A05/MF A01.

The Industrial Environmental Research Laboratory (IERL), in support of the Office of Air Quality Planning and Standards Volatile Organic Compounds (VOC) Program, has established a project for design, construction and operation of four pilot emission control units which will be transportable and represent state-of-the-art technology. The control technologies represented in the pilot systems will be (1) carbon adsorption with regeneration, (2) thermal incineration with heat recovery, (3) catalytic incineration with heat recovery, and (4) condensation. It is anticipated that the four systems will be used on actual VOC emissions from industrial processes for definition of control VOC emissions from industrial processes for definition of control feasibility, efficiencies, and to provide data for system scale-up. Since existing designs for small adsorption or incineration systems are not flexible enough to meet the needs of these applications, the pilot systems will be designed to meet the specifications outlined in this report. The designs for these pilot systems include provisions for collecting all of the data necessary to evaluate the performance of the system and to provide a sound design basis for a full-scale system.

21887 **(PB—83-105387) Social, economic and environmental effects of rising timber prices. Final report.** McKillop, W.; Adams, D.; Haynes, R.; Geissler, P. (Forest Service, Berkeley, CA (USA). Pacific Southwest Forest and Range Experiment Station). 25 Mar 1981. 97p. NTIS, PC A05/MF A01.

The effects of rising relative (real) prices for softwood lumber and plywood were estimated using analysis of supply and demand with prices stabilized at their 1977 level. Estimates were developed for the target years 1990, 2000, 2010, 2020, and 2030. The 'stable price' analysis revealed the combined effect, at the national level, of shifts in demand and supply schedules over the 1977-2030 period. Effects were estimated for lumber, log and plywood output and consumption.

5302 Assessment Of Energy Technologies

21888 **(GAO/RCED—83-38) Environmental and socioeconomic status of the Hampshire energy project.** (General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div.). 22 Oct 1982. 28p. General Accounting Office, P.O. Box 6015, Gaithersburg, MD 20760.

Report to The Chairman, Subcommittee on Environment, Energy, and Natural Resources, Committee on Government Operations, House of Representatives.

The Synthetic Fuels Corporation has conditionally advanced the Hampshire Energy project to the last stage of its project evaluation process - final financial assistance negotiations. The advancement was contingent on Hampshire's receiving all the necessary environmental and socioeconomic permits required to begin construction in the spring of 1983. Hampshire has filed applications with State of Wyoming permitting agencies for the key pre-construction permits. However, as of October 12, 1982, no permits had been granted.

21889 **(NP—3901689) Quantification of environmental costs and benefits study module VI. Final report.** (Nero and Associates, Inc., Portland, OR (USA)). Sep 1982. 67p. NTIS, PC A04/MF A01. Order Number DE83901689.

This study attempts to develop methodology for quantifying environmental costs and benefits. (PSB)

21890 **(ORNL/SUB—82-22268/1) Federal role and activities in energy research and development 1946-1980: an historical summary.** Hewlett, R.G.; Dierenfield, B.J. (History Associates, Inc., Gaithersburg, MD (USA)). Feb 1983. Contract W-7405-ENG-26. 181p. NTIS, PC A09/MF A01. Order Number DE83007179.

The federal role in energy research and development has changed substantially in the three decades since World War II. In nuclear technology, the federal presence shifted from government monopoly in the 1940s and early 1950s, to a lesser federal role in the mid-1950s, as the private sector commercialized nuclear power, to an increasing federal role in the 1960s, but now focused on the breeder reactor as a long-term option. Conventional fuel technologies such as coal and oil enjoyed only modest federal support in the immediate postwar years, with only slow increases before 1974. Renewable energy technologies have received substantial federal support only since 1973.

5303 Environmental Impact Statements

REFER ALSO TO CITATION(S) 19730, 21817

21891 **(DOE/EIS—0089D) Operation of PUREX and uranium oxide plant facilities, Hanford Site, Richland, Washington. Draft environmental impact statement.** (USDOE, Washington, DC). May 1982. 251p. NTIS, PC A12/MF A01. Order Number DE83008561.

This is an environmental impact statement (EIS) on the resumption of irradiated fuel processing at the PUREX/UO facilities located at the Hanford Site, near the Tri-Cities (Richland, Kennewick and Pasco) in southeastern Washington. This EIS describes the proposed action (resumption of chemical processing in the PUREX/UO_3 facilities in FY 1984), the reasonable alternatives, and the potential environmental consequences of teh proposed action and the alternatives. The environmental consequences of the proposed action and the three alternatives are described in detail. They include: normal operational impacts on workers, the general public, air quality, and water quality; abnormal operational impacts; onsite and offsite transportation aspects of radiation exposure from normal conditions and accidents; construction impacts; and, socioeconomic impacts from operational and construction activities.

21892 **(NP—3901052) Final Regional Environmental Impact Statement. Volume 2.** (Minerals Management Service, Metairie, LA (USA). Gulf of Mexico OCS Region). Jan 1983. 488p. NTIS (US Sales Only).

This document evaluates potential impacts from all Gulf of Mexico sales including the 11 shown in the proposed final five-year leasing schedule, and to estimates the cumulative impacts of developing all currently known estimates of oil and gas reserves in the Gulf over the life of the resource. Included in the proposed final five-year leasing schedule are 1983 oil and gas lease Sales 72, 74, and 79 in the Central, Western, and Eastern Gulf planning areas. The proposed action for each of these three sales is the offering of all unleased blocks within each planning area for which three separate sale decisions will be made. There are approximately 39 million acres in the Central Gulf (Sale 72), 33 million acres in the Western Gulf (Sale 74), and 58 million acrres in the Eastern Guld (Sale 79) for a total of 130 million acres. Analysis of the environmental and socioeconomic resources/activities of Special concern included consideration of mitigation measures which ould be implemented or invoked as part of the lease sale process. As a result of these and other analyses, as well as considerable consultation and coordination with Fish and Wildlife Service and National Park Service potential special mitigation measures were identified.

21893 **(NP—3901053) Final regional environmental impact statement. Volume 1. Gulf of Mexico.** (Minerals Management Service, Metairie, LA (USA). Gulf of Mexico OCS Region). Jan 1983. 939p. NTIS.

This document evaluates potential impacts from all Gulf of Mexico sales including the 11 shown in the proposed final five-year leasing schedule, and estimates the cumulative impacts of developing all currently known estimates of oil and gas reserves in the Gulf over the life of the resource. Included in the proposed final five-year leasing schedule are 1983 oil and gas lease Sales 72, 74, and 79 in the Central, Western, and Eastern Gulf planning areas. The proposed action for each of these three sales is the offering of all unleased blocks within each planning area for which three separate sale decisions will be made. As a result of these and other analyses, as well as considerable consultation and coordination with Fish and Wildlife Service and National Park Service potential special mitigation measures were identified.

55 BIOMEDICAL SCIENCES, BASIC STUDIES

21894 **SSAM: solid-state automated microscope.** Young, I.T. (Technical Univ., Delft, Netherlands); Balasubramanian; Dunbar, D.L.; Peverini, R.L.; Bishop, R.P. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Bio-Medical Engineering;* **BME-29**: No. 2, 70-82(Feb 1982). Contract W-7405-ENG-48.

A new microscope system that is designed to provide images for a computer has been built and tested. This system differs from previous computerized microscopes in that the fundamental design parameters have been tuned to the computer as the receiver of the image instead of the human visual system. This solid-state automated microscope system (SSAM) simultaneously provides wide-field (2 mm), high-resolution (0.5 μ), high signal-to-noise images (> 53 dB) at data rates of 5 x 10^6 pixels/s. Various methods have been developed and used to test the design specifications of the system against the actual performance.

5501 Behavioral Biology

21895 **A population model of the lizard Uta stansburiana in southern Nevada.** Turner, F.B.; Medica, P.A.; Bridges, K.W.; Jennrich, R.I. (Univ. of California, Los Angeles). *Ecological Monographs;* **52**: No. 3, 243-259(1982). Contract AC03-76SF00012.

Population densities, reproduction, and survival of the lizard Uta stansburiana were measured at the Nevada Test Site in southern Nevada, USA, between 1964 and 1974. These data were used to develop a model of the population dynamics of this species. Results of irrigation experiments in 0.4-ha enclosures near Mercury, Nevada, were used to formulate multiple-regression equations predicting frequency and size of clutches laid by two age-classes of females in terms of winter rainfall, March air temperatures and Uta population density. Densities of Uta in these enclosures were manipulated, and age-specific survival modeled in terms of spring densities of Uta. Experiments in which an important predator on Uta (the leopard lizard, Crotaphytus wislizeni) was removed from enclosures were used to estimate the influence of the predator on basic survival rates of hatchling and older Uta. The model was generally developed from data acquired in the small enclosures, but predictions were compared with actual observations of changes in Uta populations in Rock Valley (19 km west of Mercury, Nevada) between 1966 and 1972. The basic model included three density-dependent parameters: clutch frequency, clutch size, and adult survival. It was concluded that processes relating to egg production were modeled more effectively than those influencing survival, and that improvement of the model will depend on more detailed studies of the impact of predation on age-specific survival rates of Uta.

21896 (BNL—32266) Facility for in-vivo measurement of lithium. Vartsky, D.; Wielopolski, L.; Ellis, K.J.; Cohn, S.H. (Brookhaven National Lab., Upton, NY (USA)). 1982. Contract AC02-76CH00016. 5p. (CONF-8210106—3). NTIS, PC A02/MF A01. Order Number DE83007388.

From Workshop on uses of nuclear analytical methods in metal toxicology; Upton, NY, USA (11 Oct 1982).

Although lithium, an alkali metal is found in trace quantities in human, animal and plant tissue, no essential function has yet been ascribed to it. The concentration of Li in normal human tissue is in the 0.01 μg/g range, being largest in the cortical bone - 0.12 μg/g. Lithium was first used clinically for the treatment of mania. The most important clinical effect today is the prophylactic action or its ability to attenuate or prevent recurrences of manic and depressive episodes. While the absorption and excretion of Li have been studied, little is known about the distribution of Li between plasma and tissues. Li does not have a radioactive isotope which will permit these studies. Knowledge of the concentration of Li in a given tissue appears to be essential for understanding of the action of Li. Several studies in animals and postmortem specimens have been performed in vitro. This paper presents a method for in-vivo measurement of Li levels in human brain and other organs of interest such as the kidney.

21897 (CONF-8210129—1) Introduction to high-resolution two-dimensional electrophoresis in clinical chemistry. Anderson, N.G. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01. Order Number DE83007662.

From Colloquium on perspective biology; Nancy, France (3 Oct 1982).

The complex array of reactions and processes involving proteins occurring in healthy and diseased human cells was explored to develop analytical and preparative systems which allow separation, detection, and quantitative analysis of nearly all proteins in human cells and body fluids. (PSB)

21898 (NP—3900729) Annual report, July 1981-June 1982. (Academia Sinica, Taipei (Taiwan). Inst. of Botany). 1982. 44p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83900729.

Research programs conducted from July 1981 to June 1982 are briefly described. Subject areas include allelopathy of selected grasses and trees, cultivation techniques of rice, antibiotics, mycology, recombinant DNA technology, and photosynthesis. (ACR)

21899 (ORNL/EIS—163-Vol.5-Pt.1) Chemicals identified in human biological media: a data base. Fourth annual report, October 1982. Cone, M.V.; Baldauf, M.F.; Opresko, D.M.; Uziel, M.S. (comps.). (Oak Ridge National Lab., TN (USA)). Dec 1982. Contract W-7405-ENG-26. 345p. (EPA—560/5-82-003A). NTIS (US Sales Only). Order Number DE83006367.

A comprehensive data base of chemicals identified in human biological media (tissues and body fluids) has been established. This two-part volume is the annual publication of the data base for 1982. Data were obtained primarily from the open literature through manual searches (retrospective to 1974. The data base now contains information on over 1000 different substances, all of which are listed by Chemical Abstracts Service (CAS) preferred names. The data base is published annually in tabular format with indices and chemical listings that allow specific searching. The purpose of the data base is to provide a centralized resource of body-burden data, and in no way is it intended to obviate the need for the user to ultimately refer to the original literature or data source.

21900 (ORNL/EIS—163-Vol.5-Pt.2) Chemicals identified in human biological media: a data base. Fourth annual report. Cone, M.V.; Baldauf, M.F.; Opresko, D.M.; Uziel, M.S. (comps.). (Oak Ridge National Lab., TN (USA)). Oct 1982. Contract W-7405-ENG-26. 480p. (EPA—56015-82-003B). NTIS, PC A21/MF A01. Order Number DE83006369.

A comprehensive data base of chemicals identified in human biological media (tissues and body fluids) has been established. This two-part volume is the annual publication of the data base for 1982. 21901 New developments in on-line isoenzyme monitoring for use in clinical diagnostics. Bostick, W.D.; Denton, M.S.; Dinsmore, S.R. (Oak Ridge National Lab., TN). pp 111-134 of Biological/biomedical applications of liquid chromatography III. Hawk, G.L. (ed.). New York, NY; Marcel Dekker, Inc. (1981).

Preliminary data are presented describing systems for the selective, on-line detection of isoenzymes in chromatographic column effluents. The creatine kinase reaction product, ATP, may be monitored by the overall firefly bioluminescence reaction: ATP + luciferin /sup luciferase//sub Mg^{2+}/ → adenyl luciferin and adenyl luciferin + 02 → adenyl oxyluciferin + light. The reaction produces its own light emission; therefore, no external source is required and there is no nonspecfic background signal to require referencing. In addition, the use of a flow-through electrochemical cell substituted for an enzymatic microreactor in the continuously referenced detection of LD isoenzymes is described. Half of the effluent stream, containing NADH reaction product, passes through a reticulated vitreous carbon electrode, poised at +0.75 to +0.95 V (vs Ag/AgCl), while half passes through a matched-flow "dummy" side with no applied potential. A reproducible portion of the NADH (e.g., ≧70%) in the active side is reoxidized to NAD, thus producing a difference in optical signal between the sample and reference cells of a spectrophotometer monitoring 340 nm. (JMT)

21902 Correlation between photosynthesis and the transthylakoid proton gradient. Slovacek, R.E.; Hind, G. (Brookhaven National Lab., Upton, NY). *Biochimica et Biophysica Acta;* **635**: 393-404(1981). Contract AC02-76CH00016.

In isolated intact chloroplasts, maximal rates of photosynthetic O_2 evolution (in saturating $HCO^-{}_3$) are associated with a critical transthylakoid proton gradient as a result of the stoichiometric consumption of 2 mol NADPH and 3 mol ATP/mol CO_2 fixed. Studies with the fluorescent probe 9-aminoacridine reveal that in the illuminated steady state the critical ΔpH is 3.9. CO_2-dependent O_2 evolution is inhibited by increases of 0.1 to 0.2 in ΔpH that occur when catalase is omitted from the medium, $NO^-{}_2$ is included as an electron acceptor, or when chloroplasts are illuminated under low partial pressures of O_2. Low concentrations of antimycin (0.33 μM) or NH_4Cl (0.33 mM) decrease ΔpH and relieve this inhibition of electron flow. The energy transfer inhibitor quercetin lowers the high ATP/ADP ratio associated with these conditions, but does not lower ΔpH or relieve the inhibition. A decrease of ΔpH below 3.9 by weaker illumination, millimolar levels of NH_4Cl or micromolar levels of antimycin, results in lower rates of photosynthesis owing to limitation by the phosphorylation rate. These findings show that in absence of rate limitation by the carbon cycle, the extent of thylakoid energization is related to the ratio of ATP to NADPH production and in turn, the rate of CO_2 assimilation.

21903 Structure of bisadeninium dinitrate monohydrate, $(C_5H_6N_5{}^+.NO_3{}^-)_2.H_2O$. Hingerty, B.E.; Einstein, J.R.; Wei, C.H. (Oak Ridge National Lab., TN). *Acta Crystallographica;* **B37**: 140-147(1981).

The title compound, $(C_5H_6N_5{}^+.NO_3{}^-)_2.H_2O$, is monoclinic, $P2_1/m$, with a = 11.705 (2), b = 6.363 (1), c = 11.280 (1) A, β = 104.241 (6)°; Z = 2; D/sub calc/ = 1.690, D/sub obs/ = 1.70 (2) Mg m^{-3}. The structure was refined by a full-matrix least-squares method to R(F) = 0.035 for 1494 nonzero counter data to 0.84 A. Analytical absorption and isotropic extinction corrections were applied. All hydrogen atoms were located and refined isotropically. E.s.d.'s of bond lengths and bond angles involving C, N, O atoms are 0.002 A and 0.2°. The bases, and some of the other atoms, lie in the mirror planes at y = 1/4 and 3/4. The two independent adeninium ions are both protonated at N(1), and are part of an infinite hydrogen-bonded chain in the a direction. The bases are paired through hydrogen bonds, N(9)H ... N(3) and N(6)H ... N(7), where N(6) is the exocyclic amino nitrogen, as found in some other adenine salts, in some oligonucleotides, and in the acid form of polyadenylic acid. Tautomerism was found to involve the hydrogen atoms of the N(9)H ... N(3) bonds, with N(9) ... HN(3) in 20% of the sites. Base stacking occurs between one of the two adeninium ions and its screw-related partners.

21904 **(LA-UR—83-420) Molecular mechanisms of intercellular communication: transmembrane signaling.** Bitensky, M.W.; George, J.S.; Siegel, H.N.; McGregor, D.M. (Los Alamos National Lab., NM (USA)). 1982. Contract W-7405-ENG-36. 17p. (CONF-8205162—1). NTIS, PC A02/MF A01. Order Number DE83007559.

From Conference on mononuclear phagocyte biology; Wilmington, NC, USA (17 May 1982).

This short discussion of transmembrane signaling depicts a particular class of signaling devices whose functional characteristics may well be representative of broader classes of membrane switches. These multicomponent aggregates are characterized by tight organization of interacting components which function by conformational interactions to provide sensitive, amplified, rapid, and modulated responses. It is clear that the essential role of such switches in cell-cell interactions necessitated their appearance early in the history of the development of multicellular organisms. It also seems clear that once such devices made their appearance, the conformationally interactive moieties were firmly locked into a regulatory relationship. Since modification of interacting components could perturb or interfere with the functional integrity of the whole switch, genetic drift was only permitted at the input and outflow extremes. However, the GTP binding moiety and its interacting protein domains on contiguous portions of the receptor and readout components were highly conserved. The observed stringent evolutionary conservation of the molecular features of these membrane switches thus applies primarily to the central (GTP binding) elements. An extraordinary degree of variation was permitted within the domains of signal recognition and enzymatic output. Thus, time and evolution have adapted the central logic of the regulatory algorithm to serve a great variety of cellular purposes and to recognize a great variety of chemical and physical signals. This is exemplified by the richness of the hormonal and cellular dialogues found in primates such as man. Here the wealth of intercellular communiation can support the composition and performance of symphonies and the study of cellular immunology.

21905 **X-ray diffraction and electron microscope study of phase separation in rod outer segment photoreceptor membrane multilayers.** Gruner, S.M. (Princeton Univ., NJ); Rothschild, K.J.; Clark, N.A. *Biophysical Journal;* **39**: No. 3, 241-251(Sep 1982). Contract AC02-76EV03120.

Phase separation in artificially stacked multilayers of isolated bovine retinal rod outer segment (ROS) membranes has been examined via x-ray diffraction and electron microscopy. Specimens were prepared by isopotential spin drying followed with partial hydration by equilibration against moist gas streams. Upon dehydration, the multilamellar membrane phase assumes a binary phase composition consisting of concentrated protein-containing lamellae interspersed with microdomains of hexagonally packed tubes of lipid in a H/sub II/ configuration. The H/sub II/ lattice is geometrically coupled to the lamellar phase with one set of hexagonal crystal planes co-planar to the local membrane lamellae. The hexagonal microdomains bear a striking resemblance to the "paracrystalline inclusions" observed in fast-frozen, intact frog ROS (Corless and Costello, 1981. Exp. Eye Res. 32:217). The lamellar lattice is characterized by an unusually small degree of disorder. Sharp lamellar diffraction with a 120 angstrom unit cell is observed (at near total dehydration) to a resolution of 6 angstrom. A model consistent with the data is that a multilamellar array of ROS disks is stable as long as the external disk surfaces are kept sufficiently far apart. If the distance between the membranes is allowed to shrink below a certain critical value, the disk lipids, spontaneously convert to a nonbilayer phase. This suggests that the structure of the ROS is stabilized by an internal framework that acts to keep the disks apart from one another and from the plasmalemma. Thus, necessity of avoiding phase separations may provide a rationale for the peculiar morphology of the ROS.

21906 **Temperature dependence of the yield shear resultant and the plastic viscosity coefficient of erythrocyte membrane: implications about molecular events during membrane failure.** Waugh, R.E. (Univ. of Rochester, NY). *Biophysical Journal;* **39**: No. 3, 273-278(Sep 1982).

Structural failure of the erythrocyte membrane in shear deformation occurs when the maximum shear resultant (force/length) exceeds a critical value, the yield shear resultant. When the yield shear resultant is exceeded, the membrane flows with a rate of deformation characterized by the plastic viscosity coefficient. The temperature dependence of the yield shear resultant and the plastic viscosity coefficient have been measured over the temperature range of 10-40°C. Over this range the yield shear resultant does not change significantly (+/- 15%), but the plastic viscosity coefficient changes exponentially from a value of 1.3×10^{-2} surface poise (dyn s/cm) at 10°C to a value of 6.2×10^{-4} surface poise (SP) at 40°C. The different temperature dependence of these two parameters is not surprising, inasmuch as they characterize different molecular events. The yield shear resultant depends on the number and strength of intermolecular connections within the membrane skeleton, whereas the plastic viscosity depends on the frictional interactions between molecular segments as they move past one another in the flowing surface. From the temperature dependence of the plastic viscosity, a temperature-viscosity coefficient, E, can be calculated: n/sub p/ = constant x exp(-E/RT). This quantity (E) is related to the probability that a molecular segment can "jump" to its next location in the flowing network. The temperature-viscosity coefficient for erythrocyte membrane above the elastic limit is calculated to be 18 kcal/mol, which is similar to coefficients for other polymeric materials.

21907 **Lateral diffusion in an archipelago - effects of impermeable patches on diffusion in a cell membrane.** Saxton, M.J. (Univ. of California, Davis). *Biophysical Journal;* **39**: No. 2, 165-173(Aug 1982). Contract AT03-80ER10700.

Lateral diffusion of molecules in lipid bilayer membranes can be hindered by the presence of impermeable domains of gel-phase lipid or of proteins. Effective-medium theory and percolation theory are used to evaluate the effective lateral diffusion constant as a function of the area fraction of fluid-phase lipid and the permeability of the obstructions to the diffusing species. Applications include the estimation of the minimum fraction of fluid lipid needed for bacterial growth, and the enhancement of diffusion-controlled reactions by the channeling effect of solid patches of lipid.

21909 **(DOE/ER/10902—2) Biochemical and physiological characterization of higher plants with reduced photorespiration. Progress report, March 1, 1982-March 1, 1983.** Chollet, R. (Nebraska Univ., Lincoln (USA)). 1983. Contract AC02-81ER10902. 5p. NTIS, PC A02/MF A01. Order Number DE83007949.

Progress is reported in the following research areas: (1) photosynthetic carbon metabolism in naturally occurring higher plants with reduced photorespiration; and (2) physicochemical analysis of higher plant and bacterial ribulosebiphosphate carboxylase/oxygenase (RuBisCO). (ACR)

21910 **(DOE/ET/12066—1) Carbon metabolism in legume nodules. Progress report, June 1, 1982-January 30, 1983.** LaRue, T.A. (Boyce Thompson Inst. for Plant Research, Ithaca, NY (USA)). Feb 1983. Contract AC02-82ER12066. 5p. NTIS, PC A02/MF A01. Order Number DE83007895.

The oxidation and reduction of flavins and pyridine nucleotides in intact bacteria can be monitored by their changes in fluorescence. This technique permits study in nitrogen fixing bacteria of the effect of inhibitors of electron transport, and of the effect of substrates which may provide reductant for nitrogenase or oxidative phosphorylation. The nitrogen fixing ability of intact legume plants or bacteroids isolated from nodules can be manipulated downward by appropriate brief treatment of supra-optimal oxygen concentrations.

21911 **(AD-A—116670/1) Determination of material properties by limited scan x-ray tomography. Final technical report Sep 79-Jan 81.** Jarisch, W. (Scientific Systems, Inc., Cambridge, MA (USA)). Sep 1981. 138p. NTIS, PC A07/MF A01.

The purpose of this program was to explore methods of increasing the speed of the computed tomography (C/T) inspection process. The report presents an analysis of a translational data collection scheme and compares that to the tradition rotation data taken when used in most C/T machinery.

21912 **(DOE/EV/02777—T1) Evaluative studies in nuclear medicine research: positron computed tomography assessment. Final report, January 1, 1982-December 31, 1982.** Potchen, E.J.; Harris, G.I.; Gift, D.A. Reinhard, D.K.; Siebert, J.E. (Michigan Research Center, Inc., East Lansing (USA)). Feb 1983. Contract AC02-76EV02777. 87p. NTIS, PC A05/MF A01. Order Number DE83007878.

Results are reported of the final phase of the study effort generally titled Evaluative Studies in Nuclear Medicine Research. The previous work is reviewed and extended to an assessment providing perspectives on medical applications of positron emission tomographic (PET) systems, their technological context, and the related economic and marketing environment. Methodologies developed and used in earlier phases of the study were continued, but specifically extended to include solicitation of opinion from commercial organizations deemed to be potential developers, manufacturers and marketers of PET systems. Several factors which influence the demand for clinical uses of PET are evaluated and discussed. The recent Federal funding of applied research with PET systems is found to be a necessary and encouraging event toward a determination that PET either is a powerful research tool limited to research, or whether it also presents major clinical utility. A comprehensive, updated bibliography of current literature related to the development, applications and economic considerations of PET technology is appended.

21913 **(DOE/EV/04268—T1) Biomedical research with cyclotron-produced radionuclides. Progress report, August 1, 1982-February 28, 1983.** Laughlin, J.S. (Sloan-Kettering Inst. for Cancer Research, New York (USA)). 28 Feb 1983. Contract AC02-77EV04268. 61p. NTIS, PC A04/MF A01. Order Number DE83007979.

Progress in the following research areas is reported: (1) exploratory clinical metabolic studies; (2) compound synthesis labeling and associated biological studies; and (3) data analysis, modeling and instrumentation. (ACR)

21914 **(ORAU—208) Research report 1981-1982.** (Oak Ridge Associated Universities, Inc., TN (USA)). 1982. Contract AC05-76OR00033. 34p. NTIS, PC A03/MF A01. Order Number DE83007708.

This report reviews the past year's achievements, staffing, and programmatic directions. Programs in radiopharmaceutical development, nuclear medicine, biochemistry, epidemiology, cytogenetics, and marmoset research are described. The aim of our research efforts is to solve selected health problems related to respiratory, vascular, and gastrointestinal diseases and various cancers that originate from occupational exposures to chemicals or ionizing radiation as a result of energy production.

21915 **(PB—83-938200) Lung cancer: diagnosis, treatment. Cancergram ct08.** (National Cancer Inst., Bethesda, MD (USA). International Cancer Research Data Bank). 1983. 12 issuesp. Paper copy available on subscription, North American Continent price $30.00/year; all others write for quote. Also available in single copies.

The Cancergram covers clinical aspects of cancers of the lung and tracheo-bronchial tree, i.e., the lower respiratory tract. This includes primary lung cancer in both early and advanced disease states. The topic includes clinically relevant aspects of the prevention, detection, diagnosis, evaluation, and therapy of lung cancer. Certain aspects of metastatic lung disease treatment or therapy which involve aspects of interest to primary lung cancer are included. With certain exceptions, general preclinical or animal studies not directly related to the primary human disease are excluded. Respiratory tract carcinogenesis is covered by Cancergram CK15.

21916 **(PB—83-938300) Breast cancer: diagnosis, treatment, preclinical biology. Cancergram ct09.** (National Cancer Inst., Bethesda, MD (USA). International Cancer Research Data Bank). 1983. 12 issuesp. Paper copy available on subscription, North American Continent price $30.00/year; all others write for quote. Also available in single copies.

No abstract available.

21917 **(PB—83-939000) Clinical treatment of cancer: radiation therapy. Cancergram ct15.** (National Cancer Inst., Bethesda, MD (USA). International Cancer Research Data Bank). 1983. 12 issuesp. Paper copy available on subscription, North American Continent price $30.00/year; all others write for quote. Also available in single copies.

This Cancergram covers all forms of radiotherapy being used in the treatment of cancer, including standard x-ray, cobalt 60 and radium irradiation as well as high linear energy transfer (LET), megavoltage, electron beam treartment, and radioactive interstitial implants. Coverage of this topic includes adverse effects of radiotherapy, radiocurability, radiodosimetry, radiosensitization, and study with specialized instrumentation such as the betatron and linear accelerator. Radiobiology, animal experiments, tissue culture experiments, carcinogenesis, and other preclinical studies will not be included except for those considered to have direct clinical relevance.

21918 **(PB—83-939100) Cancer detection annd management: diagnostic radiology. Cancergram ct14.** (National Cancer Inst., Bethesda, MD (USA). International Cancer Research Data Bank). 1983. 12 issuesp. Paper copy available on subscription, North American Continent price $30.00/year; all others write for quote. Also available in single copies.

The Cancergram covers the field of diagnostic radiology from amniography to xerography in all of its clinical applications. It also includes such closely related techniques as fluoroscopy, ultrasonography, and thermography. Areas of interest are the clinical applications of these techniques, instrumentation, comparative studies, and any preclinical studies that have direct clinical relevance. Radiation therapy, or the use of radioactive isotopes and other nuclear medicine techniques, are not in scope, as they are covered by Cancergrams CT15 and CT02, respectively.

21919 (STI/PUB—625) **Radioimmunoassay and related procedures in medicine 1982.** (International Atomic Energy Agency, Vienna (Austria)). 1982. 810p. (CONF-8206161—). UNIPUB, P.O. Box 433, Murray Hill Station, New York, NY 10016.

From IAEA symposium on radioimmunoassay and related procedures in medicine; Vienna, Austria (21 Jun 1982).

Although it is now almost a quarter of a century since radioimmunoassay and related techniques were introduced into clinical medicine and research, the fields in which they are applicable continue to expand and new methods continue to appear. Already widely used in the assay of hormones, vitamins, drugs and various other substances, these techniques now offer considerable promise for application to parasitic and infectious diseases, which are of special importance in developing countries. The advent of monoclonal antibody methodologies gives hope for improved specificity, sensitivity and convenience, as do other technical developments such as procedures for labelling tracer substances and separating bound from unbound tracer. Labels of various kinds other than radionuclides are being intensively tested and can be expected to be of growing importance. The progress towards new areas of application, new techniques, and wider utilization throughout the world justifies a continuing emphasis on quality assurance. The expanding realization of the importance of this discipline and the increasingly wide availability of good data-processing programs for inexpensive computers suggest that this subject will receive growing attention. This symposium included 76 presentations, of which 9 were review papers and 23 were posters. These contributions, together with edited summaries of the discussions, constitute the contents.

21920 **Temperature rise during photoradiation therapy of malignant tumors.** Svaasand, L.O.; Doiron, D.R.; Dougherty, T.J. (Division of Physical Electronics, University of Trondheim, N-7034 Trondheim NTH, Norway). *Medical Physics;* **10**: No. 1, 10-17(Jan 1983).

This report discusses the optical and thermal distribution during photoradiation therapy of malignant tumors. Emphasis is put on the therapeutic procedure with the light dose delivered through an inserted optical fiber. Theoretical predictions and experimental results indicate that the temperature rise during the procedure may give rise to hyperthermal cell kill. The report discusses the extent of the regions with hyperthermal bioeffects in terms of tissue parameters as optical absorption and scattering, thermal conductivity, specific heat, blood flow, and optical dose parameters as optical power and exposure time. Key words: photoradiation therapy, hematoporphyrin derivative, hyperthermia

21921 **Density and composition imaging by photon energy spectrum sensing.** Jacobs, A.M.; Anghaie, S.; Kondic, N.N. (U.S. Nuclear Regulatory Commission, Washington, DC 20555). *Transactions of the American Nuclear Society;* **41**: 485-486(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

21922 **Application of radioactive aerosols in diagnostic techniques of bronchial obstructions in the clinical practice.** Koehler, D.; Daikeler, G.; Schuemichen, C.; Siebold, A.; Matthys, H. pp vp of Aerosols in science medicine and technology. Stoeber, W.; Hochrainer, D. (eds.). Bad Soden, Germany; Gesellschaft fuer Aerosolforschung e.V. (1981). (In German)

From Conference on aerosols in science and technology - aerosols in and from in and from industrial processes; Duisburg, F.R. Germany (23 Sep 1981).

Description of a technique for early diagnosis of chronical bronchitis, that is based on analyzing of deposition patterns obtained by inhalation of radioactive aerosoles. To this effect a new atomizer has been developed that permits to draw quantitative indications from inhalation scintiscanning.

21923 (CAPE—2761) **CAT Scanner Electron Gun (Engineering Materials).** (Stanford Linear Accelerator Center, CA (USA)). [nd]. Contract AC03-76SF00515. TIC. Order Number DE83005765.

The assembly drawing SA 701-171-01-RO CAT SCANNER ELECTRON GUN and drawings and parts listed thereon provide the data for constructing an electron gun for supplying a source of electrons for creating a suitable x-ray beam needed in some CAT scanning devices. This particular assembly is for use with a CAT scanner developed at the University of California Hospital at San Francisco, California.

21924 (SERI/CP—230-1797, pp 1-39) **Study of methanogens by genetic techniques.** Bertani, G.; Baresi, L. (California Inst. of Tech., Pasadena). Dec 1982. NTIS, PC A07/MF A01.

From SERI biomass program principal investigators review meeting; Washington, DC, USA (23 Jun 1982).

Very little information exists on the genetics of methanogenic bacteria, but significant progress in the exploitation of methanogenesis for technological purposes cannot be made without a fairly detailed knowledge of the genes involved, their products, and their regulation. This paper describes the work during the first year of a program to define the genetic systems of methanogenic bacteria. Four species of methanogens were screened for suitable growth characteristics. Methanococcus voltae and Methanobacterium thermoautotrophicum were selected for extensive work. The culture and nutritional requirements of both are given. Using ultraviolet light as a mutagenic agent, two mutants of M. voltae have been isolated and are being studied; another large sample of isolates is under investigation. A stable mutant has been isolated which will grow in higher concentrations of bromo-ethane-sulfonate (the brominated analog of Coenzyme M involved in the terminal step of methanogenesis). Also described is the sensitivity of these bacteria to antibiotics. Once the preliminary work is complete and a set of satisfactory mutants is obtained, they will be tested in at least two types of genetic recombination experiments: conjugation and DNA transformation. A search for phages will also be initiated. (CKK)

21925 (SERI/CP—230-1797, pp 41-52) **Nutritional stimulation of methane fermentation.** Speece, R.E.; Parkin, G.F.; Gallagher, D. (Drexel Univ., Philadelphia, PA). Dec 1982. NTIS, PC A07/MF A01.

From SERI biomass program principal investigators review meeting; Washington, DC, USA (23 Jun 1982).

A study was undertaken to assay the maximum acetate-utilization rates which could be produced by inorganic and organic components which had previously proven to be stimulatory to acetate-utilizing methanogenic bacteria in batch culture. Nickel, yeast extract, iron, and cobalt in various combinations were studied as the key stimulants. The pH Stat technique was used to obtain a continuous culture. Exceptionally high acetate-utilization rates were observed which were 15 times greater than what is conventionally considered to be high rate digestion, i.e. 3.3 g/l-day. It appears that nickel, iron, and/or cobalt must be supplemented to achieve high volative suspended solids (VSS) concentrations. With yeast extract only as the supplement, the highest VSS observed was 1800 mg/l; with nickel, iron, and cobalt, VSS was 3000 mg/l; and with nickel and yeast extract, VSS was 7000 mg/l. The capability of achieving such high acetate-utilization rates (51 g/l-day, 20 volumes CH_4/volume of culture/day) appears to indicate that the methanogens are indeed a unique biological group. (CKK)

21926 Bioaccumulation of technetium by marine phytoplankton. Fisher, N.S. (International Lab. of Marine Radioactivity, Monaco). *Environmental Science and Technology;* **16**: No. 9, 579-581(Sep 1982). Contract AM06-76RL02227.

/sup 95m/Tc, in the IV and VII oxidation states, was added in picomolar quantities to monocultures of seven species of marine phytoplankton, including a green algae (Dunaliella tertiolecta), a diatom (Thalassiosira pseudonana), a blue-green alga (Oscillatoria woronichinii), a prasinophyte (Testraselmis chuii), two haptophytes (Emiliania huxleyi and Cricosphaera carterae), and a dinoflagellate (Heterocapsa pygmaea). Cultures were incubated for 4 days, and uptake of Tc was periodically determined by γ spectroscopy of filtered and unfiltered samples. All the Tc remained in the water column in all flasks, but none of the species appreciably concentrated the element in either oxidation state. Mean uptake (measured as the fraction retained on filters) for all species was 0.029% for Tc(IV) and 0.023% for Tc(VII), neither of which was significantly different from the uninoculated control cultures. Wet weight concentration factors never exceeded 20 for any species, 3 orders of magnitude lower than previously reported for phytoplankton and Tc. The results indicate that phytoplankton are likely to have negligible influence on the cycling of Tc in marine systems.

21927 DNA packaging in vitro by an isolated bacteriophage T7 procapsid. Masker, W.E. (Oak Ridge National Lab., TN); Serwer, P. *Journal of Virology;* **43**: No. 3, 1138-1142(Sep 1982). Contract W-7405-ENG-26.

The results of previous in vivo studies indicate that a DNA-free procapsid (capsid I) packages bacteriophage T7 DNA during infection of Escherichia coli. It was shown here that capsid I, isolated by electrophoresis in metrizamide density gradients, packaged DNA and formed infectious phage particles when incubated in vitro with extracts deficient in capsid proteins.

21928 Orientations of terminal cladodes of Platyopuntias. Nobel, P.S. (Univ. of California, Los Angeles). *Bilten Dokumentacije;* **143**: No. 2, 219-224(1982). Contract AC03-76SF00012.

The orientations of terminal unshaded cladodes of 23 species of platyopuntias were observed in North America, South America, Australia, and Israel. When the seasonality of rainfall favored cladode development in the winter and the site was located above 27°N, the cladodes tended to face north-south (five cases, $P < .001$ for each). In all other cases without topographical blockage of incoming radiation, the tendency was to face east-west. For example, terminal cladodes of Opuntia phaeacantha var. discata and O. stricta tended to face north-south in Israel but east-west in the United States ($P > .001$). Such dissimilar orientation patterns also occurred for cladodes of 0. chlorotica at two sites in the Sonoran Desert and for O. basilaris var. basilaris developing at different seasons at a single site. Contrary to previously published observations, cladodes of O. ficus-indica and O. compressa had a significant tendency to orient ($P > .001$). When topographical features affected the direction of prevailing photosynthetically active radiation (PAR), the preferred orientation of terminal cladodes was changed accordingly. The preferred direction always maximized the interception of PAR, which is often a limiting factor in the productivity of cacti, even in a putatively high radiation environment.

21929 Effects of age on lung function and structure of adult animals. Mauderly, J.L.; Hahn, F.F. (Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM). *Advances in Veterinary Science and Comparative Medicine;* **26**: 35-77(1982). Contract AC04-76EV01013.

The approach taken in this article is largely a review and summary of previously published data, although some original data are included. The review concentrates on the effects of aging in adults rather than during development of the immature lung. In that context, aging and age-related changes will be considered to include phenomena which occur only after young adulthood. Reports containing data from animals at different ages are included, regardless of whether aging per se was an object of study. Reports containing data from animals at a single age or within a very narrow age range are not included. Thus, age-related differences measured by different investigators using a variety of techniques are compared, but no attempt is made to compare data obtained from animals at single ages by different investigators using different techniques. The article is organized by first presenting a summary (Section II) of the information available on the effects of aging on the lungs of each species. Section III consists of a detailed review of the information available for each species. The species are presented in order of decreasing amount of data available: dog, rat, Syrian hamster, rabbit, mouse, and horse. Abbreviated terms used throughout the remainder of the article are listed in Section III (footnote). Similarities and differences among species and comparisons with man are discussed in Section IV.

21930 (DOE/SR/10702—3) Effect of seeding and site-preparation practices on the establishment of sericea (Lespedeza cuneata). Annual report, September 1, 1981-December 31, 1982. Jorgensen, J.R. (Forest Service, Asheville, NC (USA). Southeastern Forest Experiment Station). 1982. Contract AI09-80SR10702. 15p. NTIS, PC A02/MF A01. Order Number DE83007906.

Sericea lespediza stands for forestry purposes were established by several methods. Stand development was followed over two growing seasons. On soils that ranged from excessively to moderately well drained, buring was nearly as effective for stand establishment as was intensive disking. Planting 11.2 kg of seed/ha produced adequate first-year stands. During the second growing season, stands - especially those with few plants, became more dense. Seeding in late winter was more successful than in late spring. Coated seed improved initial stand establishment and second-year development on severe and moderate sites sown in the winter but had little influence on stands seeded in late spring. Phosphorus fertilization had no influence on first-year establishment or development, but height of plants grown on moderate sites was improved by fertilization in the second year.

21931 (NP—3900158) Population dynamics and ecology of Tilapia rendalli in Lago Sauce (Peru). Wosnitza-Mendo, C. (Kiel Univ. (Germany, F.R.). Inst. fuer Meereskunde). 1980. 141p. (In German). NTIS (US Sales Only), PC A07/MF A01. Order Number DE83900158.

This is a practical contribution to development aid in Peru. It was to provide a basis for farming of Lago Sauce and similar lakes and introduce young Peruvian fishery biologists to practical and theoretical work with populations of freshwater fish. Various methods of biomass determination have been compared in order to find out why only small specimens of Tilapia rendalli have been caught and what ichthyobiomass was in the lake.

21932 (TVA—3901680) Users manual for YIELD: timber-yield forecasting and planning tool, Version 1.2. Hepp, T.E. (Tennessee Valley Authority, Norris (USA). Div. of Land and Forest Resources). Feb 1983. 48p. NTIS, PC A03/MF A01. Order Number DE83901680.

YIELD is an interactive FORTRAN program designed to aid foresters in determining timber management recommendations. YIELD allows the forester to input information, provide direction, and receive answers to specific questions at the computer terminal. The user can preview the simulated effect that various management strategies have on forest growth, yield and financial profitability. Information communicated from the program is useful for evaluating and scheduling timber management activities. YIELD addresses the forest stand (existing or future) as the unit of analysis. Input includes current stand conditions, a harvest schedule and simple financial data. Output consists of concise reports that summarize forecasted volume yield, cash flows, and measures of profitability (i.e., internal rate of return and present net worth). The interactive design enables the forester to see how profitability measures change in response to a changing harvesing schedule or planting density, or with the manipulation of a number of variables. An option is available to perform financial calculations on either a before or after taxation basis. YIELD provides stand level growth, yield, and financial analysis information.

21933 (TVA/ONR/LFR—83/4) **Comparable Sale Data Base users manual. Version 1.1.** Purcell, J.E. (Tennessee Valley Authority, Norris (USA). Office of Natural Resources). Nov 1982. 31p. NTIS, PC A03/MF A01. Order Number DE83901676.

The Comparable Sale Data Base (COMPSALE) is a computer-based information system for consulting foresters and others involved in buying and selling property, timber, agricultural products, or other marketable commodities. COMPSALE allows the forester or resource manager to store sale data in the computer and access the data later in summary form. It puts comparable sale information at the forester's fingertips through easy-to-use procedures. The computer asks the necessary questions to guide the user through each procedure. Step-by-step instructions are given for inputting data in the program. COMPSALE is designed to work on microcomputers with a CRT screen, a floppy disk data storage, an 80-column printer, and the ability to run the COBOL program.

21934 (TVA/ONR/LFR—83/6) **User's manual for the TVA lumber yield and value program (LYVP). Version 1.0.** Harrison, T.P. (Tennessee Valley Authority, Norris (USA). Office of Natural Resources). Nov 1982. 49p. NTIS, PC A03/MF A01. Order Number DE83901675.

The Lumber Yield and Value Program (LYVP) is complementary to the Inventory Processor. (See: A User's Manual for the TVA Forest Inventory Program, July 1979, Station Bulletin No. 230). Many of the inputs needed for the Inventory Processor are also used by LYVP. Tree grade must be supplied for LYVP, but is optional for the Inventory Processor. Data on pulpwood observations, pine sawtimber, cull trees, and growth projections are ignored by LYVP, but may be necessary for compatibility with the Inventory Processor. Output tables predict board foot volume and dollar value by species and lumber grade. Summary data are presented on both tract and per-acre basis as well as for the entire sampling unit. The lumber yields expressed in LYVP are functions of species, d.b.h. merchantable height, and tree grade; therefore, some of the inputs used for the Inventory Processor such as log rule and form class are not needed when LYVP is used independently. Lumber prices used in LYVP calculations to predict lumber values may be obtained from any reliable source. Prices used by TVA are from the Hardwood Market Report and reflect lumber values for air dried, carload lots. Stumpage prices should not be used in any LYVP calculations.

56 BIOMEDICAL SCIENCES, APPLIED STUDIES

21935 (UCID—19676) **Calculation and interpretation of In-Situ measurements of initial radiations at Hiroshima and Nagasaki.** Loewe, W.E. (Lawrence Livermore National Lab., CA (USA)). 16 Feb 1983. Contract W-7405-ENG-48. 39p. (CONF-830209—1). NTIS, PC A03/MF A01. Order Number DE83006396.

From US/Japan joint workshop on the reassessment of A-bomb radiation dosimetry in Hiroshima and Nagasaki; Nagasaki, Japan (16 Feb 1983).

Cobalt activation calculations will be reviewed, and similar comparisons of sulfur activation interior to electrical insulators on power transmission lines will be discussed. The relationship between neutron tissue kermas one to two kilometers from hypocenter and the particular activations of cobalt and sulfur are reviewed. At present, measured and calculated quantities agree within associated uncertainties, which are substantial. Additional work to shrink these uncertainties will be discussed. Particular cobalt activation topics will include: the sensitivity to thermal neutrons outside the pillar; calculated values using actual Nagasaki concrete composition; and calculational advances to improve modelling of the actual configuration. Particular sulfur activation topics will include: absolute comparisons of measured and calculated ratios of dpm/gm of ^{32}P at all measured ranges, based on approximate experimental values for insulator attentuation and source radiations; the relationship between sulfur activation within a kilometer of hypocenter and kermas at two kilometers; and calculational advances to improve modelling of the actual configuration.

21936 (AD-A—115541/5) **Aircrew ionizing doses from radioactive dust cloud generated by nuclear burst. Master's thesis.** Hickman, B.E. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Mar 1982. 77p. (AFIT/GNE/PH—82M-9). NTIS, PC A05/MF A01.

This report will evaluate the threat of radioactive fallout to which aircrew members will be exposed when flying through a descending fallout cloud. A computer program is developed for calculating the ionizing dose rate of a radioactive dust cloud as a function of time, and also the dose that an aircrew receives when flying through the respective cloud. A cloud model that is patterned after the AFIT fallout smearing code was developed. A comparison is made between the activities at various altitudes from 305 meters to 9150 meters to provide information for possible re-direction of flight. The external ionizing dose to the aircrew is computed by the new code considering the cloud size, the aircraft's transit time through the cloud, and the ingestion rate of radioactive particles into the aircraft's cabin. Information is also provided to indicate the method by which doses can be computed from a cloud of multiple bursts. The results demonstrate that total dose to each aircrew member is approximately 8 rems after flying through a fallout cloud one hour after cloud stabilization of a 1 Mt burst, with the mission continuing for eight hours subsequent to the cloud transit.

21937 (AD-A—115825/2) **Behavioral studies following ionizing radiation exposures: a data base. Technical report.** Franz, C.G.; Young, R.W.; Mitchell, W.E. (Armed Forces Radiobiology Research Inst., Bethesda, MD (USA)). Aug 1981. 94p. NTIS, PC A05/MF A01.

For over a decade, the Behavioral Sciences Department (BHS) of the Armed Forces Radiobiology Research Institute (AFRRI) has collected data concerning the effects of ionizing radiation on primate performance. These data are the basis for the current radiation combat casualty criteria used by the armed forces of this country and NATO. In order to ensure the continued accessibility of these data and to increase their usefulness in retrospective studies, the data have been consolidated into a computerized data base. This report provides potential users with the background and details necessary to access the data base and to retrieve information from it. The report defines the search parameters for the data base, and discusses the sources, extent, and reliability of data contained in the data set.

21938 (AD-A—121713/2) **Theory, electro-optical design, testing, and calibration of a prototype atmospheric supersaturation, humidity, and temperature sensor. Final report Mar 81-Jul 82.** Nelson, L.D. (Newmark, Hansen and Associates, Urbana, IL (USA)). 15 Jul 1982. 117p. NTIS, PC A06/MF A01.

A new infrared differential absorption - passive thermal emission based instrument designed to make accurate in-cloud measurements of absolute humidity, air temperature, relative humidity, and ice and water supersaturations has been developed. Absolute humidity is measured by the differential infrared absorption of a broad-band light beam between 2.45 microns wavelength and the strongly absorbing water vapor band at 2.67 microns. Air temperature is sensed by a passive radiometric measurement of the Planck's law radiance emitted by carbon dioxide molecules in their very intense emission band at 4.25 microns. Significant operational advantages over previous 14-16 micron band radiometers are achieved. These non-contact optical measurements of absolute humidity and true air temperature can then be combined to yield relative humidity values with respect to both water and ice which remain valid in condensing supersaturated conditions and in spite of hydrometeors in the sample volume.

21939 (AD-A—121815/5) Biochemical changes in blood components after lethal doses of radiation. Final report Oct 80-Sep 81. Magro, A.M. (Newmark, Hansen and Associates, Urbana, IL (USA)). Oct 1982. 28p. NTIS, PC A03/MF A01.

Nonpeptide, peptide, and protein blood components were measured postirradiation in Wistar rats to investigate biochemical changes that might be related to or form the basis of radiation-induced emesis. The rats were irradiated with lethal doses of radiation, and blood components were analyzed at various times postirradiation. The blood-component levels were compared to those of nonirradiated controls to determine if any significant changes occurred due to the radiation.

21940 (ANL/NESC—908) AERIN; radioactive aerosol dose calculations. Voilleque, P.G. (USDOE Idaho Operations Office, Idaho Falls). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048908.

Maxima of - 9 organs 299 calculations per organ It is assumed that the blood acts only as a mechanism for the transport of material to the various body organs and tissues and need not be considered a separate compartment.

AERIN calculates organ and tissue burdens and doses resulting from acute exposure to a radioactive aerosol as a function of time after exposure. The International Commission on Radiological Protection (ICRP) model proposed by the Task Group on Lung Dynamics is used to predict deposition and retention of the aerosol in the lungs.IBM360,303x; FORTRAN IV; OS/360; 105K bytes of memory are required for execution.

21941 (ANL/NESC—923) DACRIN; radiation organ dose from inhalation. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Watson, E.C. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048923.

Maxima of - 10 downwind distances at which dose is calculated 10 organs 10 time intervals measured from the most recent intake 5 multiple intake intervals.

DACRIN is designed to provide rapid and consistent estimates of the effective radiation dose to the human respiratory tract and other organs resulting from the inhalation of radioactive aerosols. The program will calculate the effective radiation dose to any of 18 organs and tissues from inhalation of any one or a combination of radionuclides considered by the International Commission on Radiological Protection (ICRP). Input to the program consists of a few program control variables, the duration of inhalation exposure, ventilation rate, the time interval within which the dose is delivered, the organs of interest, the quantity of the radionuclide inhaled, its solubility class and particle size, and, when an atmospheric dispersion model is invoked, the additional parameters required for the model selected. Output provided by DACRIN consists of the effective radiation dose to the specified organs at selected time intervals for each radionuclide inhaled as indicated by the input data.UNIVAC1100; FORTRAN; EXEC8; 56,000 words of memory are needed to execute the program.

21942 (ANL/NESC—924) SUBDOSA; external dose airborne radionuclides. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Houston, J.R. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048924.

Maxima of - 500 nuclides 10 downwind distances 6 release time intervals 4 tissue depths SUBDOSA does not consider the dose resulting from radionuclides deposited in the body and its organs via inhalation.

SUBDOSA calculates external gamma and beta doses to individuals from the accidental release of radionuclides to the atmosphere. Doses are calculated as a function of: quantity released, duration of release, atmospheric conditions during the release, and horizontal distance from the release point. Doses from both gamma and beta radiation are calculated as a function of depth in tissue, summed and reported as skin, eye, gonadal, and total body dose. Doses are calculated within each of several release time intervals with separate nuclide inventories and atmospheric dispersion conditions used for each interval. Radioactive decay using a chain decay scheme with branching to account for transitions to and from isomeric states is considered during the release. The program computes normalized air concentrations at ground level as a function of distance from the point of release.UNIVAC1100; FORTRAN; EXEC8; 43,000 words of memory are needed for execution of SUBDOSA. BIVAR, an auxiliary program which calculates dose rate factors as a function of energy, requires 13,000 words of memory.

21943 (ANL/NESC—925) ARRRG;FOOD; aquatic & terrestrial radiation. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Strenge, D.L. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048925.

Maxima of - 23 possible body organs or tissues (ARRRG and FOOD) 5 organs and 100 radionuclides in a mixture (ARRRG and FOOD) 5 ingestion pathways (ARRRG) 3 external pathways (ARRRG) 14 food type pathways (FOOD) 1 external pathway (FOOD);.

ARRRG calculates radiation doses to humans for radionuclides released to bodies of water from which people might obtain fish, other aquatic foods, or drinking water, and in which they might fish, swim, or boat. FOOD calculates radiation doses to humans from deposition on farm or garden soil and crops during either an atmospheric or water release of radionuclides. Deposition may be either directly from the air or from irrigation water. With both programs, doses may be calculated for either a maximum-exposed individual or for a population group. Doses calculated are a one-year dose and a committed dose from one year of exposure. The exposure is usually considered as chronic; however, equations are included to calculate dose and dose commitment from acute, one-time, exposure.UNIVAC1100; FORTRAN; EXEC8; 51,000 words of memory are required to execute ARRRG; 61,000 words are required by FOOD.

21944 (ANL/NESC—926) PABLM; accumulated environment radiation dose. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Soldat, J.K. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048926.

Maxima of - 23 possible body organs or tissues 19 ingestion pathways 5 organs and 100 radionuclides in a mixture 4 external exposure pathways.

PABLM calculates internal radiation doses to man from radionuclides in food products and external radiation doses from radionuclides in the environment. Radiation doses from radionuclides in the environment may be calculated from deposition on the soil or plants during an atmospheric or liquid release, or from exposure to residual radionuclides after the releases have ended. Radioactive decay is considered during the release, after deposition, and during holdup of food after harvest. The radiation dose models consider exposure to radionuclides deposited on the ground or crops from contaminated air or irrigation water, radionuclides in contaminated drinking water, aquatic foods raised in contaminated water, and radionuclides in bodies of water and sediments where people might fish, boat, or swim. For vegetation, the radiation dose model considers both direct deposition and uptake through roots. Doses may be calculated for either a maximum-exposed individual or for a population group. The program is designed to calculate accumulated radiation doses from the chronic ingestion of food products that contain radionuclides and doses from the external exposure to radionuclides in the environment. A first-year committed dose is calculated as well as an integrated dose for a selected number of years.UNIVAC1100; FORTRAN; EXEC8; 80,000 words of memory are required to execute the PABLM program.

21945 (CONF-820451—2) **Human-health effects of radium: an epidemiolgic perspective of research at Argonne National Laboratory.** Stebbings, J.H. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 39p. NTIS, PC A03/MF A01. Order Number DE83007799.

From DOE radiation epidemiology contractors workshop; Rockville, MD, USA (13 Apr 1982).

The topic of health effects of radium has recently been considerably broadened by the identification of multiple myeloma as a specific outcome of bone-seeking radionuclides, and by evidence that the incidence of breast cancer may be significantly increased by radium exposure. All soft-tissue tumors are now suspect, especially leukemias. Concepts of dose-response need to be broadened to include the concept of risk factors, or, if one prefers, of susceptible subgroups. Biological factors relating to radium uptake and retention require study, as do risk factors modifying risk of both the clasical tumors, osteosarcoma and nasal sinus/mastoid, and the more recently suspect soft-tissue tumors. The history, organization, and current research activities in epidemiology at Argonne National Laboratory are described, and findings of the last decade and a half reviewed. Plans for future research are briefly discussed.

21946 (DOE/EV/04992—T1) **Study of feasibility of detecting effects of low-dose radiation in shipyard workers. Final report, May 15-August 15, 1978.** Matanoski, G.M. (Johns Hopkins Univ., Baltimore, MD (USA)). Dec 1982. Contract AC02-78EV04992. 10p. NTIS, PC A02/MF A01. Order Number DE83007973.

There is very little information available on the chronic health effects from repeated low-level doses of radiation. This study examines the adequacy of determining radiation exposure doses in shipyard workers, the procedures used in the radiation control programs, and the feasibility of establishing an appropriate population of nuclear and non-nuclear shipyard workers for long-term studies of low-level radiation. The availability of records and the methods of population identification and of measurement of radiation dose were determined during initial visits to the yards. Personnel, industrial hygiene, radiation and medical records were examined for suitability, completeness and accuracy. It was necessary to assure that no possible errors or omissions in personnel and radiation records existed in order that the final data will have validity. Preliminary investigations on the methods of follow-up in the Portsmouth population and the time required for each procedure were also undertaken in order to have a better estimate of the total cost for a long term study.

21947 (GSF-BPT—2/81, pp 190-194) **Investigations on the influence of increased UV-B-radiation on the development, composition, structure and function of plants.** Tevini, M.; Iwanzik, W. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

The influences of increased UV-B-radiation with various intensities, such as would be expected after a reduction of the ozone layer, were examined on barley, corn, beans and red radish. The biological efficacy of the UV-B-radiation can be assessed with the aid of weighting functions for DNA. Examination of the structure of the leaf surfaces by stereo-scan-microscopy showed a far-reaching collapse of the epidermis and stomata following the UV-B-radiation.

21948 (GSF-BPT—2/81, pp 195-199) **Influence of increased UV-B-radiation on cultivated plants following pollutant immission.** Esser, G. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

The investigations were carried out in the open air on potatoes, spring-barley, spinach, savoy, beans and large radish. Parameters for the UV-B-action were the yield, production (photosynthesis, photorespiration and darkness respiration rates), as well as the content of plant constituents such as protein, starch, sugar, total lipids, chlorophyll and vitamin C. A remarkably strong reaction of the test plants to very slight UV-B-intensities was seen.

21949 (GSF-BPT—2/81, pp 200-203) **Quantitative UV action.** Zoelzer, F.; Kiefer, J. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

In a wild-type strain and an excision-deficient strain the survival and resistance to mutation against canavanin upon radiation with increasing wavelength were studied. As compared to the latter, the wild type is less sensitive by about two orders of magnitude. With increasing wavelength, a lessening of the mutagenic action as compared to the lethal one is observed. Moreover the importance of photo-reactivatable damage decreases. An unchanged importance in the excision-deficient form is noted.

21965 **(N—82-18269) Advanced biostack experiment.** Buecker, H. (Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt e.V., Aachen (Germany, F.R.). Inst. fuer Theoretische Gasdynamik). Nov 1981. 3p. NTIS, PC A08/MF A01.

In NASA. Marshall Space Flight Center Spacelab Mission 1 Expt. Descriptions 3 p (SEE N82-18234 09-12).

The Advanced Biostack Experiment is described. The objectives are: (1) to confirm, complement, and enlarge the information obtained from the previous experiments by applying improved and advanced methods of localization and physical and biological evaluation, performing advanced experiments based on these data, and including additional biological specimens and additional radiation detectors (2) to determine the biological importance of nuclear disintegration stars (3) to determine the interference of HZE particle induced effects with those of other space flight factors (e.g., weightlessness) and (4) to determine the distribution of HZE particles and of disintegration stars at different locations inside the module and on the pallet.

21966 **(PB—82-211236) Dosimetry for industrial radiation processing. Final report.** McLaughlin, W.L.; Humphreys, J.C.; Miller, A. (National Bureau of Standards, Washington, DC (USA)). Feb 1982. 8p. Pub. in Proceedings of a Meeting on Traceability for Ionizing Radiation Measurements, Gaithersburg, Maryland, May 8-9, 1980, p171-178 Feb 82.

In the dosimetry related to sterilization of goods by ionizing photons and electrons, and in other industrial radiation applications, i.e., modification of plastic and other materials, food preservation, and treatment of waste products, it is important to have traceability to standard absorbed dose measurements. The preferred primary methods of dosimetry for large radiation doses ($>$10 Gy) are considered. Using these techniques as primary reference methods, it is possible to calibrate the response characteristics of routine dosimeters, such as plastics, dyed plastics, and solid-state sensors in terms of a reproducible signal versus known values of absorbed dose. Dose levels and dose gradients within a sizable irradiated volume, e.g., product packages, are determined within specified values of uncertainty, which may be set in terms of statistical error and precision in making practical interpretation of dose and dose limits.

21967 **(PB—83-135707) Radiation protection: progress report. 1981.** (Commission of the European Communities, Luxembourg). [nd]. 968p. NTIS PC E99/MF E99.

Progress achieved in more than 300 research projects carried out in the European Community in 1981 under the radiation protection program is reported. A comprehensive review of the status of the radiation protection studies in which the EC is participating is provided. Under the general heading of Research in Radiation Protection, details are given of work in radiation dosimetry and its interpretation, the behavior and control of radionuclides in the environment, short-term, late somatic, and genetic effects of ionizing radiation, and the evaluation of radiation risks. Coordination activities are reviewed. A selection of relevant publications issued on the initiative of the Commission is summarized, and attention is drawn to the 1981 edition of the Directive laying down the basic safety standards for the health and protection of the general public and workers against the dangers of ionizing radiation, adopted by the Council on July 15, 1980.

21968 **(PB—83-137372) Plutonium burdens in people living around the Rocky Flats plant. Final report 1976-79.** Cobb, J.C.; Eversole, B.C.; Archer, P.G.; Taggart, R.; Efurd, D.W. (Colorado Univ., Denver (USA). Health Sciences Center). Nov 1982. 256p. NTIS, PC A12/MF A01.

A study was conducted to determine whether the tissues of people who lived near to or downwind from the Rocky Flats nuclear weapons facility in Colorado contained more plutonium than the tissues from people who lived farther away. Information was collected on the age, sex, smoking history, residence history, presence of disease, and plutonium level in selected tissues from individuals autopsied in various Eastern Colorado hospitals. The 236, 238, 239 and 240 isotopes of plutonium were determined. Plutonium levels in lung and liver tissues were affected by age and smoking history more than by distance from the Rocky Flats Plant. Though the measured 240/239 isotope ratio indicated a small contribution from Rocky Flats, the total amount of plutonium in the samples was no different than in similar samples collected from other areas of the U.S.

21969 **(PB—83-935500) Radiation carcinogenesis. Cancergram ck06.** (National Cancer Inst., Bethesda, MD (USA). International Cancer Research Data Bank). 1983. 12 issuesp. Paper copy available on subscription, North American Continent price $30.00/year; all others write for quote. Also available in single copies.

The Cancergram deals with all aspects of radiation carcinogenesis. The term 'radiation' here includes U-V radiation and the entire electromagnetic spectrum, electron and other charged particle beams, neutrons, and alpha and beta radiation from radioactive substances. Abstracts included concern relationships between radiation and carcinogenesis in humans, experimental induction of tumors in animals by irradiation, studies on the mechanism of radiation carcinogenesis at the cellular level, studies of RBE, dose response or dose threshold in relation to radiation carcinogenesis, and methods and policies for control of radiation exposure in the general population. In general, this Cancergram excludes abstracts on radiotherapy, radiologic diagnosis, radiation pathology, and radiation biology, where these articles have no bearing on radiation carcinogenesis.

21970 (PNL-SA—10714, pp 68-73) **Reevaluation of the Hiroshima-Nagasaki radiation doses.** Roesch, W.C. (Pacific Northwest Lab., Richland, WA). Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

The dosimetry system currently used in analyzing the Hiroshima-Nagasaki data was developed by the Oak Ridge National Laboratory. Their T65 system was called into question following a new study of the incidence of leukemia in the two cities. H.H. Rossi and C.W. Mays concluded that a worker continually exposed to neutrons at the maximum permissible level recommended by the National Council on Radiation Protection (NCRP) stood a chance of developing leukemia that was several times higher than for the average unexposed person. Rossi and Mays recommended the NCRP reduce its permissible doses for neutrons by an order of magnitude. One of the reponses of the NCRP to this recommendation was to set up a Task Group on Atomic-Bomb Dosimetry, under the chairmanship of H.O. Wyckoff, to review the dosimetry for the data that had led to the Rossi-Mays conclusion. This paper reviews the work of this task group which has been divided into 5 areas: bomb spectra, fireball gamma rays, radiation transport, buildings, and depth dose.

21971 **(PNL-SA—11106) Field measurement and interpretation of beta doses and dose rates.** Selby, J.M.; Swinth, K.L.; Hooker, C.D.; Kenoyer, J.L. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76RL01830. 15p. (CONF-830204—3). NTIS, PC A02/MF A01. Order Number DE83007077.

From International beta dosimetry symposium; Washington, DC, USA (15 Feb 1983).

A large number of portable survey instruments employing G.M., ionization chamber, and scintillation detectors used for gamma measurements are also used for monitoring in beta fields by using removable shields to separate the beta and gamma components of the radiation field. The difference does not correspond to an absorbed dose rate for the beta field due to a variety of factors. Among these factors are the dependence on beta energy, source-detector geometries, mixed fields and variable ambient conditions. Attempting to use such measurements directly can lead to errors as high as a factor of 100. Appropriate calibrations and correction factors can be used to reduce the errors in beta measurements to a tolerable level.

21972 **(UCID—19624) Reevaluation of an individual's radiation exposure at NTS in 1963-64.** Myers, D.S. (Lawrence Livermore National Lab., CA (USA)). 25 Feb 1983. Contract W-7405-ENG-48. 79p. NTIS, PC A05/MF A01. Order Number DE83008596.

The FRAN prompt burst reactor began operation at NTS on November 1, 1962 and continued in use until April 1965. From January 2, 1963 to August 12, 1964, an individual periodically performed maintenance and troubleshooting functions on various components of the FRAN reactor system. In June, 1980, the individual requested a review of the radiation dose that he received from his involvement with the FRAN reactor. An evaluation of the individual's radiation dose associated with the FRAN reactor operation was performed. This report details the reevaluation of the individual's estimated radiation dose from the FRAN reactor assembly, as derived from computer calculations, GODIVA-IV measurements, personnel dosimetry results, and a reconstruction of work scenarios.

21973 **(UCRL—88376) Tritium effects on germ cells and fertility.** Dobson, R.L.; Kwan, T.C.; Straume, T. (Lawrence Livermore National Lab., CA (USA)). 19 Nov 1982. Contract W-7405-ENG-48. 13p. (CONF-821167—1). NTIS, PC A02/MF A01. Order Number DE83007349.

From European seminar on the risks from tritium exposure; Mole, Belgium (22 Nov 1982).

Primordial oocytes in juvenile mice show acute gamma-ray LD_{50} as low as 6 rad. This provides opportunities for determining dose-response relations at low doses and chronic exposure in the intact animal - conditions of particular interest for hazard evaluation. Examined in this way, ^{3}HOH in body water is found to kill murine oocytes exponentially with dose, the LD_{50} level for chronic exposure being only 2μCi/ml (delivering 0.4 rad/day). At very low doses and dose rates, where comparisons between tritium and other radiations are of special significance for radiological protection, the RBE of tritium compared with ^{60}Co gamma radiation reaches approximately 3. Effects on murine fertility from tritium-induced oocyte loss have been quantified by reproductive capacity measurements. Chronic low-level exposure has been examined also in three primate species - squirrel, rhesus, and bonnet monkeys. In squirrel monkeys the ovarian germ-cell supply is 99% destroyed by the time of birth from prenatal exposure to body-water levels of ^{3}HOH (administered in maternal drinking water) of only 3 μCi/ml, the LD_{50} level being 0.5 μCi/ml (giving 0.1 rad/day), one fourth that in mice. Though not completely ruled out, similar high sensitivity of female germ cells has not been found in macaques; and it probably does not occur in man. The exquisite radiosensitivity of primordial oocytes in mice is apparently due to vulnerability of the plasma membrane (or something of similar geometry and location), not DNA. Evidence for this comes from tritium data as well as neutron studies. Tritium administered as ^{3}HOH, and therefore generally distributed, is much more effective in killing murine oocytes than is tritium administered as ^{3}H-TdR, localized in the nucleus. This situation in the mouse may have implications for estimating radiation genetic risk in the human female.

21974 **Radiation responses in air-, nitrous oxide-, and nitrogen-saturated mammalian cells.** Roots, R.; Chatterjee, A.; Blakely, E.; Chang, P.; Smith, K.; Tobias, C. (Lawrence Berkeley Laboratory, Berkeley, CA). *Radiation Research;* **92**: No. 2, 245-254(Nov 1982). Contract W-7405-ENG-48.

Characteristics of cellular radiation chemistry were studied for mammalian cells saturated with air, nitrous oxide, or nitrogen in the absence or presence of an OH-radical scavenger, for both low- and high-LET radiations. For clarity, the data for low-LET studies are presented separately in this paper, while the results for densely ionizing particle radiations will be discussed in a subsequent manuscript. Cell monolayers were grown in glass vessels and irradiated with 225-kVp X rays. The contribution of OH-radical action was reduced from about 55% in aerobic cells to about 20% in nitrogen-saturated cells. In nitrous oxide-saturated cells, the indirect effect attributable to OH. is about 35%. OH-radical-mediated lesions can therefore result in oxygen-independent as well as oxygen-dependent lesions. Our results show that the hydrated electron does not contribute significantly to radiolethality in anaerobic cells.

21975 Associations between tumor types in irradiated BALB/c female mice. Storer, J.B. (Oak Ridge National Lab., TN). *Radiation Research;* **92**: No. 2, 396-404(Nov 1982). Contract W-7405-ENG-26.

Associations between pairs of 12 different tumor types were estimated for a population of over 3800 irradiated BALB/c female mice. The associations were adjusted for age and radiation dose. Of the 66 pairs of tumor types, 21 showed significant positive or negative associations. Of these, 8 were considered to be spurious, principally because one or both of the tumors was rapidly lethal, leading to an apparent negative association. Six of the remaining 13 significant associations involed tumors of endocrine organs or tumors known to be endocrine related. Six others involved associations between lung, vascular tissue, or reticular tissue tumors, and tumors of endocrine organs. The remaining and highly negative association was between reticulum cell sarcomas and other lymphomas and leukemias. It was concluded that in irradiated female mice of this strain, at least, tumors are not independent and that alterations in host factors (principally endocrine) lead to animals developing both tumors (positive associations) or to one tumor but not the other (negative associations).

21976 Radiation sensitization and chemical studies on isoindole-4,7-diones. Infante, G.A. (Catholic Univ., Ponce, Puerto Rico); Gonzalez, P.; Cruz, D.; Correa, J.; Myers, J.A.; Ahmad, M.F.; Whitter, W.L.; Santos, A.; Neta, P. *Radiation Research;* **92**: No. 2, 296-306(Nov 1982).

Radiosensitization characteristics of newly synthesized isoindole-4,7-diones, and the chemical basis of their action, were studied. Rate constants and redox potentials for the one-electron reduction of these compounds were determined by pulse radiolysis. The values obtained resemble those of nitroimidazole derivatives and indicate that these new chemicals are potential radiosensitizers. This was confirmed by studies on the radiosensitization effects of the isoindolediones tested in vivo using soft tissue sacroma transplanted in mice. The results show a high level of radiosensitization by these compounds. The mechanisms of action of these new radiosensitizers are comparable to those of other electron-affinic sensitizers. It is anticipated that the compounds studied will provide a basis for the development of a new class of radiosensitizers.

21977 Radium-224 retention, distribution, and dosimetry in beagles. Lloyd, R.D.; Mays, C.W.; Taylor, G.N.; Atherton, D.R.; Bruenger, F.W.; Jones, C.W. (Univ. of Utah, Salt Lake City). *Radiation Research;* **92**: No. 2, 280-295(Nov 1982).

The retention, distribution, and dosimetry of injected ^{224}Ra were studied in six young adult beagles killed 0.04 to 7 days after ^{224}Ra administration. Biological retention of ^{224}Ra in the skeleton averaged 48% (37 to 60%), and soft-tissue retention decreased from 61% at 0.04 days to 6% at 7 days. At death there was more ^{212}Pb in red blood cells and liver than the amount in transient equilibrium with the ^{224}Ra in these tissues. There was an excess of 2^{12}Bi over ^{224}Ra in kidneys, and a deficiency of both 2^{12}Pb and ^{212}Bi relative to ^{224}Ra in eyes and bone. The retention equations derived from the data suggest that the fractional escape of ^{220}Rn produced in bone by ^{224}Ra decay was roughly 0.08. From the retention of ^{224}Ra, ^{212}Pb, and ^{212}Bi in the skeleton and selected soft tissues, it was calculated that the injection of 1 μCi ^{224}Ra/kg into an adult beagle having 75 g skeleton/kg body results in cumulative average doses to the blood-filled organs of 40 rad to the skeleton, 13 rad to the kidneys, 8 rad to the liver, 11 rad to the eyes, and 0.8 rad to the testes and ovaries.

21978 Tissue distribution and excretion of actinides absorbed from the gastrointestinal tract of rodents; and reply. Harrison, J.D.; Stather, J.W. (National Radiological Protection Board, Harwell (UK)); Sullivan, M.F. (Battelle Pacific Northwest Labs., Richland, WA (USA)). *Health Physics;* **43**: No. 2, 283-286(Aug 1982).

Letters to the editor.

21979 Estimation of radiation doses to the lungs of early uranium processing plant workers. Polednak, A.P. (Oak Ridge Associated Univ., TN); Keane, A.T.; Beck, W.L. *Environmental Research;* **28**: No. 2, 313-328(Aug 1982). Contract AC05-76OR00033.

Methods are described for the crude estimation of radiation doses to the lungs of workers in early uranium processing plants. Using data on selected plants, we estimated lung doses for groups of workers exposed to uranium dust alone, or in association with γ rays and radon gas derived from radium in uranium ores. Estimated 30-year lung doses for groups of chemical workers at a large uranium enrichment plant (in operation from 1943 to 1947) varied considerably, depending upon such factors as length of employment, types of uranium compounds, average air concentrations of uranium, and isotopic composition of the uranium. Some workers may have received lung doses as high as several hundred rem. The uncertainties in these crude dose estimates are described, along with the possible effects of host factors. Implications of these dose estimates for assessment of long-term health effects (i.e., lung cancer) are discussed, with reference to preliminary findings of mortality studies on workers at uranium processing plants.

21980 Studies with encapsulated ^{125}I sources. I. Apparatus and dosimetry for determination of relative biological effectiveness. Goldhagen, P.E.; Freeman, M.L.; Hall, E.J. (Columbia Univ., New York, NY). *International Journal of Radiation Oncology, Biology and Physics;* **8**: No. 8, 1347-1353(Aug 1982). Contract AC02-78EV04733.

Apparatus and dosimetry techniques have been developed which make possible studies of the biological effects of radiation from encapsulated ^{125}I sources at clinically relevant dose rates using mammalian cells attached to culture dishes. The variation of dose rate from ^{125}I photons as a function of distance from the interface between different materials was investigated. A polystyrene substrate changes the mean dose rate in attached cells by about 21%, depending on cell thickness. To reduce dosimetry uncertainty caused by this effect, special petri dishes were made from polyvinylidene fluoride, which changes the mean dose in attached cells by only 10%. Chinese hamster ovary cells attached to these dishes were cultured in incubators which contained ^{125}I and ^{137}Cs sources, allowing the effects of various dose rates (.005 to 0.80 Gy/hr) of radiation from the two isotopes to be compared. The relative dose rates from these low- and high-energy photons were measured with an accuracy of +/- 7% or better using an air-equivalent ionization chamber designed to resemble one of our special petri dishes. Calculations of dose rates from ^{125}I give values within 4% of the measured dose rates used to determine the relative biological effectiveness of ^{125}I photons.

21981 Studies with encapsulated ^{125}I sources. II. Determination of the relative biological effectiveness using cultured mammalian cells. Freeman, M.L.; Goldhagen, P.; Sierra, E.; Hall, E.J. (Columbia Univ., New York, NY). *International Journal of Radiation Oncology, Biology and Physics;* **8**: No. 8, 1355-1361(Aug 1982). Contract AC02-78EV04733.

Chinese hamster ovary (CHO) cells, in either exponential growth or unfed plateau phase were exposed to graded doses of radiation from Iodine-125 or from Cesium-137 at various dose-rates and the cells were assayed for reproductive integrity. From the patterns of cell survival obtained, the relative biological effectiveness (RBE) of the emission from ^{125}I was determined relative to ^{137}Cs. The RBE determined using cells in exponential growth was found to have a value of about 1.2, which was independent of the level of cell survival and did not vary over the dose-rate range from 7.5 to

53 cGy/hr. Using plateau phase cells the RBE has a constant value of about 1.3 between 13 to 46 cGy/hr, but is closer to 2.0 at lower dose-rates of 5 to 7 cGy/hr.

21982 **Modifications of the IRCP task group lung model to reflect age-dependence.** Crawford, D.J.; Eckerman, K.F. (Oak Ridge National Lab., TN (USA)). *Radiation Protection Dosimetry;* 2: No. 4, 209-220(1982).

The results of calculations on the age dependence of a variety of parameters appearing in the Task Group Lung Model of the ICRP are presented. In particular, information is given on the effect of age on regional deposition, removal by the mouth, retention in the tracheobronchial region following deposition on the mucociliary blanket, and traversal of the TB region by material deposited in the pulmonary region. All requisite calculations were performed with the use of a detailed age dependent lung model developed by the authors, with results averaged to ensure compatibility with the ICRP Task Group Lung Model.

21983 **Carcinogenesis following prenatal exposure to radiation.** Sikov, M.R. (Pacific Northwest Lab., Richland, WA). *International Journal of Biological Research in Pregnancy;* 2: No. 4, 159-167(1981). Contract AC06-76RL01830.

This review summarizes the literature dealing with postnatal development of tumors after prenatal exposure of laboratory animals to external radiation and to radionuclides. Many investigators have reported these exposures to be carcinogenic, some have not detected an effect, and still others observed decreased incidences of some tumor types. The resulting patterns of response suggest several pertinent biologic interactions that may be involved in the response elicited by prenatal irradiation.

21984 **Health effects from internally deposited radionuclides released in nuclear disasters.** McClellan, R.L.; Boecker, B.B.; Cuddihy, R.G.; Griffith, W.C.; Hahn, F.F.; Muggenburg, B.A.; Scott, B.R.; Seiler, F.A. (Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM). pp 28-39 of Control of exposure of the public to ionizing radiation in the event of accident or attack. Reston, VA; National Council on Radiation Protection and Measurement (1981). Contract AC04-76EV01013.

A substantial amount of data exists on both early- and late-occurring effects of internally-deposited radionuclides in laboratory animals. These data, in combination with more limited human data, provide a basis for predicting the consequences of exposure to radionuclides released in a nuclear disaster. Many disasters could result in the release of numerous radionuclides; however, there are adequate exposure-health effect data on only a few specific radionuclides. Thus for risk estimation purposes, an approach is used that involves calculation of the dose to specific organs for a given exposure and then use of organ specific risk estimators for calculating the risks to individual organs. More than one radionuclide or form of radionuclides may be released in a nuclear disaster, and several organs may be exposed. Thus the need may arise to obtain an estimate of the individual's total risk. In obtaining such as estimate, it is important to sum only those effects that are of comparable severity and occur during the same time period, i.e., it would be inappropriate to sum the risk of pulmonary fibrosis and the probability of late-occurring death from lung cancer from radionuclides deposited in the lung.

21985 **Risks of radiation: induced lung cancer.** Cuddihy, R.G. (Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM). pp 133-151 of Critical issues in setting radiation dose limits. Washington, DC; National Academy of Sciences (1981). Contract AC04-76EV01013.

From 17. annual meeting of the National Council on Radiation Protection and Measurements; Washington, DC USA (8 Apr 1981).

The risk of developing lung cancer after exposure to ionizing radiation has been studied extensively in people and in laboratory animals. The studies of human populations include survivors of the nuclear weapons used in Hiroshima and Nagasaki, medical patients with ankylosing spondylitis who received x-ray treatments and several groups of underground uranium and hardrock miners. The atomic bomb survivors and spondylitis patients received high dose-rate external exposures to either neutron and gamma radiations or x-rays over major portions of their bodies. The underground miners mainly received chronic alpha irradiation of their bronchial airway epithelium. At the present time, little information is available on lung cancer risks in people who inhaled radioactive particles that resulted in prolonged irradiation of the parenchymal lung tissues. The objective of this report is to use the results of studies performed in laboratory animals that inhaled radioactive aerosols as a means of extending the information obtained from studies in humans to project lung cancer risks from different types of radiation exposures.

5602 Thermal Effects

21986 **(PB—82-258062) Biological responses of the american oyster 'Crassostrea virginica' (gmelin) to thermal effluent in the Chesapeake-Delaware Bay area. Final report.** Tinsman, J.C.; Maurer, D.; Pennachi, K.A. (Delaware Univ., Lewes (USA). Coll. of Marine Studies). Jan 1981. 107p. NTIS, PC A06/MF A01.

This report presents the results of a 1979 study of various aspects of the life history of the oyster, Crassostrea virginica, and the effects of temperature-salinity interactions in the mid-Atlantic region. The study was intended to provide input to power plant siting decisions in the Chesapeake Bay area. Eighteen collections of planted oysters were made from effluent and control stations of two power plant sites in the mid-Atlantic region. Oyster mortalities were related to physical extremes at both sites, but were higher at PEPCO. Shell growth was evident at DPL, but not at PEPCO.

21987 **Energy partitioning in largemouth bass under conditions of seasonally fluctuating prey availability.** Adams, S.M.; McLean, R.B.; Parrotta, J.A. (Oak Ridge National Lab., TN). *Transactions of the American Fisheries Society;* **111**: No. 5, 549-558(Sep 1982). Contract W-7405-ENG-26.

Allocation of consumed energy by largemouth bass Micropterus salmoides into their major physiological processes was determined to investigate mechanisms by which these predators maintain condition (overall health) in a system with a seasonally fluctuating prey base. Consumed energy is partitioned into growth, energy storage, and gonads according to temporal prey availability, metabolic demands, and reproductive needs. Throughout minimum-feeding periods in the winter and early spring, largemouth bass utilize energy from visceral fat and body protein for standard metabolic demands and gonad development. Catabolism of energy from body tissue during the winter was less than 33% of standard metabolic demands, indicating that some consumption had to occur during the winter. The calculated activity metabolism of largemouth bass ranged from 18 to 144% of standard metabolism depending on time of year and sex. Parallel trends of activity metabolism and consumption over the year suggest that foraging costs may constitute a large fraction of activity metabolism. To maintain condition in a system where their primary prey undergoes large fluctuations in seasonal abundance, largemouth bass maximize caloric growth in the fall, store visceral fat, minimize standard and active metabolic demands, and undertake some winter feeding in warm thermal areas.

5603 Chemicals Metabolism And Toxicity

REFER ALSO TO CITATION(S) 19666, 19667, 19667, 19738, 20255, 21747, 21819, 21825, 21861, 21884

21988 **(AD-A—115053/1) Position paper: the toxic effects of chronic exposure to low levels of carbon dioxide. Interim report.** (Naval Submarine Medical Center, Groton, CT (USA). Submarine Medical Research Lab.). 19 Jan 1982. 46p. (NSMRL—973). NTIS, PC A03/MF A01.

Numerous patrol studies have provided a sizable data base of levels of CO2 exposure and health problems encountered by Naval nuclear submariners. Humans have been exposed to a variety of concentrations of CO2 for chronic periods of time aboard submarines, as well as in laboratory environments. Mean data, PICO2 = 10 torr and 40 days, collectively represent this wide variety of CO2 exposures. >Physiological responses to the CO2 environment were repeatedly documented, but toxic effects were not apparent.< Human exposures were safely conducted in atmospheres containing up to 5 torr CO2, for up to 90 days. Such exposures are therefore considered safe at this time. Animal studies showed that chronic, low-level, CO2 exposures caused changes of the bone content of CO2, the bone content of calcium, the soft tissue content of calcium, and histological changes of the lung. These changes were found to be completely reversible upon discontinuance of the animal's exposure to CO2. >The extrapolation of the animal data to humans is a current problem in the advancement of our understanding of the effects of CO2 on humans.<.

21989 (CONF-820275—2) **Effects of air pollutants on corn.** Kress, L.W. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 13p. NTIS, PC A02/MF A01. Order Number DE83007637.

From Workshop on effects of air pollution on farm commodities; Washington, DC, USA (17 Feb 1982).

The effects of O_3, SO_2, HF, and NO/sub x/ on field corn (Zea mays L.) are reviewed. Research needs and strategies for damage amelioration are discussed. (ACR)

21990 (CONF-821071—2) **Potentially hazardous air contaminants in the home.** Woodring, J.L. (Argonne National Lab., IL (USA)). 19 Oct 1982. Contract W-31-109-ENG-38. 42p. NTIS, PC A03/MF A01. Order Number DE83007826.

From 70. annual national safety congress and exposition; Chicago, IL, USA (19 Oct 1982).

The health concerns of several substances likely to be encountered in the non-industrial indoor environment are discussed. Monitoring data and information on the health effects of CO, NO_2, formaldehyde, and radon are included. (JGB)

21991 (CONF-830216—1) **Dendroecological analysis of forest growth responses.** McLaughlin, S.B.; Blasing, T.J.; West, D.C. (Oak Ridge National Lab., TN (USA)). 1983. Contract W-7405-ENG-26. 8p. NTIS, PC A02/MF A01. Order Number DE83007506.

From Acid rain program review meeting; Raleigh, NC, USA (21 Feb 1983).

In a study designed to determine if productivity of forests in the eastern US has been affected by increased atmospheric pollution of recent decades, tree rings measurements are being made. The survey involves collection and analysis of increment cores from approximately 500 trees at each of 12 study sites, representing wide variations in soil characteristics and pollution histories. Initial progress is summarized. (JGB)

21992 (CONF-8103155—, pp 147-160) **Effects of digested sewage sludge on the heavy metal concentrations in various vegetable species.** Rasp, H.; Siegel, O. 1981. (In German). NTIS (US Sales Only), PC A06/MF A01.

From 17. meeting on municipal composts and food quality; Speyer, F.R. Germany (26 Mar 1981).

During the period of 1972-1974 increasing quantities of anaerobically and aerobically digested sewage sludge from Blaubeuren were administered on a test field of the LUFA, Speyer, to red cabbage, tomatoes, carrots, and onions. As the evaluation of the test shows, the yield of the planted cultures is not necessarily determined by the amount and type of composted sludge. The ground improving effect of the composts has obviously also an influence on the yields. A comparison of the yields of the individual vegetable sorts with the concentrations of cadmium, copper, and zinc showed no clear relation. The concentrations of the heavy metals mentioned above change relatively strongly within the individual years and independent of the amount of the composts.

21993 (DE—82-000154) **Radiological and environmental research 1980: ecology.** (Argonne National Lab., IL (USA)). Jul 1981. 131p. NTIS, PC A07/MF A01.

Field grown and greenhouse grown soybeans are studied to determine the effects of sulfur dioxide, nitrogen dioxide, ozone, etc. on their crop yield. The effects of radioactive wastes on the Lake Michigan and its ecology are also studied.

21994 (DOE/EV/04329—2) **Response of native plant individuals and communities to elevated CO_2. Progress report 1982.** Bazzaz, F.A. (Illinois Univ., Urbana (USA)). 1982. Contract AC02-77EV04329. 8p. NTIS, PC A02/MF A01. Order Number DE83007896.

Research progress is reported in the following areas: (1) the effect of elevated CO_2 on competitive interactions of a community of annuals under high and low light intensities; (2) competitive interactions of soybean/Abutilon and soybean/Amaranthus at different levels of carbon dioxide and soil nutrient level; and (3) the response of two tree assemblages to CO_2 concentrations. (ACR)

21995 (DOE/EV/10100—T2) **Final progress report on carcinogenic agents.** Borek, E. (AMC Cancer Research Center and Hospital, Lakewood, CO (USA)). 1983. Contract AC02-79EV10100. 5p. NTIS, PC A02/MF A01. Order Number DE83007327.

The aim was to study the mechanism of action of some carcinogenic agents which do not react with DNA. The only common factor is that they elevate the progesterone level in the blood of the target animal. Two highly significant mechanisms have been found which may relate to the carcinogenic activity of such compounds: (1) the accumulation of methyl-1 deficient poly A-containing mRNA on administration of ethionine to rats; and (2) the effect of the tumor promoter 12-0-tetradecanoyl-phorbol-13-acetate (TPA) on tRNA methyltransferases. (ACR)

21996 (GSF-BPT—2/81, pp 185-189) **Action of environmental chemicals on the primary processes of photosynthesis.** Renger, G.; Graeber, P. May 1981. (In German). NTIS (US Sales Only), PC A10/MF A01.

From 2. seminar of the Gesellschaft fuer Strahlen- und Umweltforschung; Neuherberg, F.R. Germany (27 Oct 1980).

Starting from the observed inhibition of electron transport, the experiments aimed to localize the site of action of diphenylamine derivatives. In order to test an eventual analogy to DCMU action, the influence of chloroplastene treatment with trypsin was investigated. The resulting O_2 formation rates show differing influences on the inhibitor action for various derivatives. By the employed method of measuring fluorescence induction curves, it is possible to detect noxious actions within the plant leaf in situ.

21997 (Juel-Spez—163, pp 20-41) **Development and proof-testing of a method for assaying the bio-degradibility of organic substances under anaerobic milieu conditions.** Wagner, R.; Braeutigam, H.J. Jul 1982. (In German). NTIS (US Sales Only), PC A08/MF A01.

In Methods for the ecotoxicological evaluation of chemicals. Vol. 1.

The test is carried out by precultivating anaerobic digestion media under standardized conditions, adding systematically increasing amounts of the test substance to them and then treating the resulting mixtures anaerobically at 30°C for 21 to 28 days under steady agitation. During the test period the amount of gas generated and its composition are determined. Conclusions as to the toxic effects or anaerobic biodegradability of the test substance are arrived at by considering the extent to which gas generation is inhibited or enhanced resp. Nonmodified carbohydrates (glucose, maltose, cellulose, starch) proved themselves to be easy to degrade anaerobically. Chemically modified polysaccharides (carboxymethyl starch, carboxymethyl cellulose, hydroxyethyl cellulose) gave results indicating that with increasing degrees of etherification their anaerobic biodegradation is rendered increasingly difficult. From the reference chemicals tested, aniline, 4-chloroaniline, dichlorophynoxy acetic acid, 2-nitrophenol and 4-nitrophenol proved themselves to be anaerobically non-biodegradable. Moreover 2-nitrophenol and 4-nitrophenol acted as strongly toxic agents. Both methanol and phenol were subject to anaerobic bio-degradation after a lag-phase.

21998 (Juel-Spez—163, pp 42-63) **Study of the physiological effects of pollutants in carp.** Hanke, W.; Bittner, A.; Horn, G.; Mueller, R.; Keppler, R. Jul 1982. (In German). NTIS (US Sales Only), PC A08/MF A01.

In Methods for the ecotoxicological evaluation of chemicals. Vol. 1.

Investigations about the influence of two groups of pollutants on physiological parameters of carps were performed. The first group consisted of extreme toxic pollutants like atrazin, HCB, DDT and PCP. The general pollutants as phenol, methanol, chloroform and urea belonged to the second group. Determinations of osmolality and electrolyte content of blood plasma clearly showed that a weak intoxication results in an increase of osmolality and Na concentration. Severe intoxication was indicated by a decreasing osmolality and Na concentration while the K content increased. In the case of urea, special changes occurred because of the uptake of this compound into the body. For a short time, plasma glucose increased under the influence of pollutants. The glycogen content of the liver was also firstly augmented. Severe intoxication resulted in a decrease of plasma glucose and liver glycogen. The whole complex is interpreted as stress phenomenon. Under the influence of atrazin, the amount of red blood cells decreased whereas azurophilic granulocytes increased. Further on, lytic stages of erythrocytes were often found. The use of further physiological tests for the proof on pollutants is discussed.

21999 (Juel-Spez—163, pp 64-73) **Development and verification of a behavior test of fishes in flowing water for assessment of subacute and chronic toxicity, as well as study of influencing factors.** Bemmer, P. Jul 1982. (In German). NTIS (US Sales Only), PC A08/MF A01.

In Methods for the ecotoxicological evaluation of chemicals. Vol. 1.

A method was developed and tested employing the banded cylinder technique to help in the early diagnosis and evaluation of sub-lethal and chronic injury caused by chlorinated hydrocarbons in fish. The banded cylinder device was continually improved technically during the entire course of the investigation as experience was gained. The following parameters could be varied: the pattern used as a stimulus and its speed of rotation, the direction of rotation, the width of the swimming channel, the concentration of the contaminants in the water, and the water temperature. Several fish species were used in the experiments: ide (Leuciscus idus (L.), carp (Cyprinus carpio L.), minnows (Phoxinus phoxinus (L.) and trout (Salmo gairdneri Richardson). The movements of the fish were recorded automatically using the magnetic marking method. Although several different experimental procedures were employed, none could be found that provided reproducable results and showed promise of becoming a standard method. The reason seems to be that there is too much variability among the reactions of individual fish to a visual stimulus to use this parameter for the quantitative evaluation of sublethal injury or intoxication.

22000 (Juel-Spez—163, pp 74-94) **Development and verification of a fish test in flowing water for comparable quantification of biological accumulation and the impacts of influencing factors.** Langer, D.; Schuetz, W. Jul 1982. (In German). NTIS (US Sales Only), PC A08/MF A01.

In Methods for the ecotoxicological evaluation of chemicals. Vol. 1.

Investigations on the accumulation and elimination of hexachlorobenzol, lindane, pentachlorophenol, dioctylphthalate, trichloroethylene and trichlorobenzol were conducted using ide, trout, carp, and minnows as experimental animals. The concentrations of the chemicals rapidly decreased in static test systems, so a flow-through system and dosage regulator were developed to hold the experimental parameters constant. This also permitted long-term experiments. The contaminant was applied either in the water or in the food. The following conclusions were reached: - Storage and elimination of the substance applied are to a great extent dependent on the fat content of the animal. - Whether the contaminants were administered with the water or with the food, an accumulation plateau was reached, dependent upon the specific qualities of the chemicals. - A general correlation between the distribution of the contaminant among the organs and their fat content was observed. - A general agreement between the results obtained using isolated train-oil and living fish indicated that the distribution of the contaminants can be described as an equilibrium between two phases.

22001 (Juel-Spez—163, pp 95-110) **Acute and chronic effects of selected substances of the EC 'black list' on representative freshwater animals.** Schreiber, I.; Besch, W.K. Jul 1982. (In German). NTIS (US Sales Only), PC A08/MF A01.

In Methods for the ecotoxicological evaluation of chemicals. Vol. 1.

The readiness of Hydropsyche larvae to weave catching nets was lowered by 24 and 48 hs exposure to 100 and 200 mg Trichlorethylen. 24 hs treatment with the same substance followed by 24 hs recovery led to a stimulation of weaving and improved net quality. 500 μg Hg/l (as $HgCl_2$) and 5 mg Phenol/l reduced the numbers of net spinning larvae. Using the same individuals as their own controls by comparing pre- and post treatment nets the threshold concentration of $HgCl_2$ could be lowered by more than 50%. After exposure to 50 and 100 mg Phenol/l some larvae lost their capacity to orientate their catching nets in respect to the water current. The Hydropsyche net weaving test is very informative but at the same time very time consuming.

22002 (NP—3901015) **Uptake and fate of Cd and Zn in edible fungi of the Agaricus bisporus species.** Huetter, M. (Duesseldorf Univ. (Germany, F.R.). Medizinische Fakultaet). 1979. 51p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE83901015.

Thesis.

Cd and Zn were added to growth substrate of fungi in order to investigate the Cd uptake and the effects of Zn on Cd uptake in the edible fungus Agaricus bisporus. Fungus yields were found to decrease with Cd uptake. This effect was completely overcome and sometimes even overcompensated by adding zinc. Cd concentrations in the fungi increased with the soil Cd concentration: When Cd (5.0 and 10.0 mg/kg Fg) was added to the soil cover as well as to the substrate, Cd concentrations in the fungi were found to be about 70% higher than in fungi where the same amount of Cd had been added only to the substrate. The following interactions between Cd and Zn uptake were observed: Low soil Cd concentrations enhance Zn uptake. In contrast, Zn enhances Cd uptake in fungi with low Cd concentrations. At high soil Cd concentrations, Zn inhibits Cd uptake. Cd concentrations in the fungi increased with the age of the cultures and with the size of the fungi. The highest concentrations were found in the lamellae. The enrichment factors are lower in the cultivated variety (0.6 to 1.4 in dependence of the soil Cd concentration) than in wild-growing fungi.

22003 (PB—80-157217) **Effects of sulfuric acid rain on two model hardwood forests: throughfall, litter leachate, and soil solution.** Lee, J.J.; Weber, D.E. (Environmental Protection Agency, Corvallis, OR (USA). Environmental Research Lab.). Jan 1980. 50p. (EPA—600-3-80-014). NTIS.

Simulated sulfuric acid rain (pH 3.0, 3.5, 4.5, and 5.6) was applied to model forests containing either sugar maple (Acer saccharum) or red alder (Alnus rubra). Water samples were collected above and below the canopy, below the litter, and from 20 cm and 1 m below the surface of the soil. While throughfall chemistry was not very different from rain chemistry, the litter leachate (the actual input to the soil) had consistently higher concentrations of calcium and magnesium, and higher pH than the acid rain. For the first 6 months, sulfate absorption by the soil prevented any apparent differences in sulfate, calcium, or magnesium concentrations in the 20-cm soil solution among plots receiving acid or control rain treatments. Sulfate concentrations on plots receiving the most acid rain (pH 3.0) then became increasingly higher than on the other plots until after 3 years, they were approximately equal to sulfate concentrations in the rain. Twenty-cm soil solutions corresponding to the pH 3.5 and 4.0 treatments responded similarly starting respectively 1 year and 2 years after initiation of exposure to acid rain. Increased calcium and magnesium concentrations and lowered pH in 20-cm soil solution occurred simultaneously with increased sulfate concentrations. No acid rain related effects were evident in the 1-m soil solution even after 3.5 years exposure to pH 3.0 sulfuric acid rain. Cation responses to increased anion concentrations followed those predicted by a computer-simulation model. However, sulfate concentrations in 20-cm soil solutions increased considerably faster than predicted by a Langmuir formulation of sulfate absorption.

22004 (PB—82-196403) Megration of low molecular weight additives in poluolefins and copolumers. Final report. Chang, S.S.; Senich, G.A.; Smith, L.E. (National Bureau of Standards, Washington, DC (USA)). Mar 1982. 259p. (NBSIR—82-2472). NTIS, PC A12/MF A01.

Food packaging is an inseparable part of modern life. Any substance that migrates from the packaging material into foods is viewed as indirect food additives. In connection with toxicological knowledge, it is important to know the amount of such indirect food additives expected to be present in the food during storage and processing. This program, sponsored by the Bureau of Foods of the Food and Drug Administration is to provide theoretical models, reliable data base, methodology to study the migration phenomena and to provide reasonable worst-case estimates for the concentrations of the indirect additives in food. In this final report, the authors present the results of approximately 250 completed migration experiments based on radiotracer techniques on the migration of low molecular weight hydrocarbons and antioxidants from polyethylene, polypropylene and ethylene-vinyl acetate copolymers. Results of a study for the determination of relative diffusion coefficients of several probe molecules in the polyethylene melt by inverse gas chromatography are also presented. Based on these studies, ethanol appears to be a far more reasonable food-oil stimulating solvent than n-heptane. Other pure or mixed triglycerides may also be considered as food-oil simulating solvents, however they may pose the same analytical difficulties as that of the food oil itself.

22005 (PB—82-241795) Sensitivity analysis on Coburn model predictions of COHB levels associated with alternative CO standards (EPA staff paper). (Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards). Jul 1980. 32p. NTIS, PC A03/MF A01.

In the June 1, 1979 draft staff paper presented to the Clean Air Scientific Advisory Committee, EPA included a table depicting carboxyhemoglobin (COHb) responses to CO exposures as predicted by the Coburn Model. This table presents baseline or nominal estimates of the COHb levels expected to be achieved by nonsmokers to constant CO concentrations for 1 to 8 hours. Uncertainties exist, however, in using these estimates to decide which standards provide an adequate margin of safety. First, even among normal person variations exist in the physiological parameters used in the Coburn model. These variations are sufficient to provide noticalbe deviations from the COHb levels that were predicted using normal parameters. Even more substantial variations in these parameters are observed in population groups such as anemics that may be more sensitive to CO exposure. Second, predictions based on exposure to constant CO concentrations inadequately represent the response of individual exposed to widely fluctuating concentrations that typically occur in ambient exposure situations. An attempt was made to represent these uncertainties by performing a sensitivity analysis unsing the Coburn model in a dynamic mode to predict the COHb responses to specific patterns of fluctuating ambient concentrations of CO for individuals with physiological parameters different from the baseline values. The results of this analysis are given.

22006 (PB—82-258591) Impact of air pollution on vegetation near the Columbia Generating Station - Wisconsin power plant impact study. Tibbitts, T.W.; Will-Wolf, S.; Karnowsky, D.F.; Olszyk, D.M. (Wisconsin Univ., Madison (USA). Inst. for Environmental Studies). Jun 1982. 228p. NTIS, PC A11/MF A01.

The impact of air pollution from the coal-fired Columbia Generating Station upon vegetation was investigated. Air monitoring of 03 and 02 documented levels that occurred before and with operation of the generating station. Field sampling of alfalfa, lichens, and white pines was undertaken before and after initiation of generating station operations. Controlled environmental exposures were undertaken with separate cultivars of crop species grown in the vicinity of the generating station. Alfalfa, carrots, mint, peas, beans, and trembling aspen were exposed to SO2 and O3 to establish minimum threshold pollutant levels for injury from these pollutants.

22007 (PB—83-137224) Industrial hygiene survey of the General Electric Company, Hudson Falls, New York, Fort Edward, New York. Report for Jun 76-Apr 77. Jones, M. (National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Div. of Surveillance, Hazard Evaluation and Field Studies). 6 Jan 1973. 24p. NTIS, PC A02/MF A01.

Worker exposures to polychlorinated-biphenyls (1336363) (PCB), lead (7439921), tin (7440315), zinc (7440666), toluene (108883), methyl-isobutyl-ketone (108101) (MIBK), trichloroethylene (79016), aluminum (7429905), and iron (7439896) were determined at the General Electric Company (SIC-5065) in Hudson Falls, and Fort Edward, New York, on June 21 to 28, 1976, and on April 27 to 28, 1977. The survey was part of a NIOSH study of the health effects of occupational PCB exposure. The author recommends improved ventilation in the impregnation, soldering, and repair areas, and improved work practices or engineering controls to prevent vapors from escaping the degreaser unit.

22008 (PNL-SA—11110) Inhalation exposure study of a solvent-refined-coal material. Springer, D.L.; Mahlum, D.D.; Ragan, H.A. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1983. Contract AC06-76RL01830. 22p. (CONF-821172—1). NTIS, PC A02/MF A01. Order Number DE83007843.

From 13. annual conference on environmental toxicology; Dayton, OH, USA (16 Nov 1982).

An evaluation of the toxicologic effects of solvent refined coal (SRC) material has been exended to include an inhalation exposure study. The material selected for this study was heavy distillate (HD), the 550 to 850°F fraction from the SRC-II process, obtained from the pilot plant at Ft. Lewis, Washington which is operated by the Pittsburgh and Midway Coal Mining Co. Results indicate that exposure to HD at 0.7 and 0.14 mg/L caused a significant alteration in growth for male and female rats; however, at 0.03 mg/L very little effect was observed. Even though body weight gain was severely depressed for animals in the high-exposure group, 94% of these rats survived the 13 wk of exposure. Most deaths occurred during the last 3 wk of the exposure. A complete necropsy (approximately 35 tissues) was performed at the end of each exposure including weights of heart, liver, lung, spleen, thymus, brain, kidneys, adrenals, and gonads. Results are presented.

22009 Effects of NO_2 on immune responses in pulmonary lymph of sheep. Joel, D.D.; Chandra, P.; Chanana, A.D. (Brookhaven National Lab., Upton, NY). *Journal of Toxicology and Environmental Health;* **10**: No. 2, 341-348(Aug 1982). Contract AC02-76CH00016.

Sheep in which the efferent duct of the caudal mediastinal lymph node was cannulated were exposed to 5 ppm NO_2, 1.5 h/d for 10 or 11 d. Immune responses were assessed by measuring the daily output of hemolytic plaque-forming cells (PFC) in pulmonary lymph, following intrabronchial immunization with horse red blood cells (HRBC) and phytohemagglutinin- (PHA) induced transformation of blood and pulmonary lymph lymphocytes. Sheep immunized 2 d after termination of NO_2 exposure had reduced outputs of PFC as compared to those seen in sheep challenged 4 d after NO_2 exposure. Animals immunized 4 d after NO_2 exposure had outputs similar to those of air control sheep.A reduction of 38-87% in the transformation index of both blood and pulmonary lymph lymphocytes was observed in sheep exposed to NO_2. These results suggest that intermittent, short-term exposure to 5 ppm NO_2 may temporarily alter pulmonary immune responsiveness.

22010 Lung function and morphology of dogs after sublethal exposure to nitrogen dioxide. Johnson, W.K.; Mauderly, J.L.; Hahn, F.F.; Muggenburg, B.A. *Journal of Toxicology and Environmental Health;* **10**: No. 2, 201-221(Aug 1982). Contract AC04-76EV01013.

The relationship between respiratory function and morphological changes in 10 dogs exposed for 6 h to 69 ppm nitrogen dioxide was studied. Two additional dogs served as controls. Functional assessments included breathing pattern, breathing mechanics, forced expiration, gas exchange, and acid-base status. Gross, microscopic, and ultrastructural evaluations were made of lung tissues from dogs killed at 0.1, 1.0, 2.0, 3.0, 7.0 and 14.0 d after exposure. Functional changes were similar to those reported for man. The principal dysfunction was gas-exchange impairment, apparently resulting from foam in the airways. Breathing-pattern alterations appeared to result from stimulation of neural receptors. Gas-exchange measurements provided the most useful indicators of the pulmonary damage observed in this study.

22011 **Electrical determination of viability in saline-treated mouse myeloma cells.** Matsushita, T.; Brendzel, A.M.; Shotola, M.A.; Groh, K.R. *Biophysical Journal;* **39**: No. 1, 41-47(Jul 1982). Contract W-31-109-ENG-38.

Suspension of mouse myeloma cells in phosphate buffered saline (PBS) induced a significant amount of cell death. The lethal effects of PBS include an increase in cell lysis, a decreased ability of cells to exclude trypan blue, and a decrease in the colony-forming ability of these cells. Dead cells were also detected on a Coulter counter by the increase in the fraction of cells with a smaller electrical size distribution (ESD). Comparing mixtures of live and dead cells by ESD and trypan-blue exclusion showed a high correlation of electrical size with viability (correlation coefficient = 0.98). Sizing of PBS-treated cells by light microscopy suggested that the altered ESD of the PBS-treated cells was due to a downward shift in the volume distribution. Light-scattering experiments also suggested a decrease in the size of cells after PBS treatment. An increase in permeability of the cell membrane may also contribute to these results. We conclude that electrical sizing is an excellent indicator of physical changes that result from PBS-induced cell death, and is an effective method for distinguishing live and dead mouse myeloma cells after PBS treatment.

22012 **Effects on rat lung immunity by acute lung exposure to benzo(a)pyrene.** Schnizlein, C.T. (Medical Coll. of Virginia, Richmond); Bice, D.E.; Mitchell, C.E.; Hahn, F.F. *Archives of Environmental Health;* **37**: No. 4, 201-206(Jul 1982). Contract AC04-76EV01013.

This study describes the effect of intratracheal instillation of benzo(a)pyrene (BaP) on immunological responses in the lung-associated lymph nodes, cervical lymph nodes, and spleen after deposition of 10^8 sheep red blood cells (SRCB) in the lung or peritoneal cavity of rats. An increased number of anti-SRBC antibody-forming cells was observed in the lung-assoicated lymph nodes when rats were immunized simultaneously with BaP instillation. A suppression in the number of anti-SRBC antibody-forming cells occurred when SRBC were given intratracheally 4 or 7 days after BaP. The effects of the BaP appeared to be on the function of the cells in the lung-associated lymph nodes rather than due to changes in the exposed lung. BaP-induced changes in antigen handling or in regulatory populations of immune cells in the lung-associated lymph nodes may be responsible for the immune alterations observed.

22013 **Germination and growth effects of hexavalent chromium in Orocol TL (a corrosion inhibitor) on Phaseolus vulgaris.** Parr, P.D.; Taylor, F.G. (Oak Ridge National Lab., TN). *Environment International;* **7**: No. 3, 197-202(1982). Contract W-7405-ENG-26.

This research was designed to address the potential for germination and growth effects in bush beans (Phaseolus vulgaris L. var. Bush Blue Lake) from hexavalent chromium in Orocol TL, a proprietary chromated, zinc-phosphate compound added to DOE cooling water systems for corrosion inhibition. Studies were conducted at low and high Orocol TL concentrations in the soil by adjusting soil pH and the percent of organic matter. Germination effects were determined for seeds germinated in soils adjusted to differing pH ranges (4-4.5, 5-5.5, and 6.5-7), levels of organic matter (1.8%, 3%, and 5%), and Orocol TL amendments (control of 0, 10, and 500 μg/g chromium). Growth responses (effects) were determined from plants cultured in the same soil treatment combinations as described for the germination study. High levels (500 μg/g) of hexavalent chromium in soil (as Orocol TL) affected germination and growth, while a high level of organic matter significantly reduced chromium toxicity on germination. At lower chromium concentrations there was significant uptake by all plant parts, with a corresponding reduction in biomass of leaves. Consequently, adjustments of soil pH from 4.0 to 7.0 appear to have no significant effect on chromium uptake in plants. Increasing the organic matter level to 5%, while decreasing the toxicity of high chromium levels to germinating seed, did not affect chromium uptake.

22014 **Extrapolation of mutagenicity testing to the human.** Mendelsohn, M.L. (Lawrence Livermore National Lab., CA). pp 113-116 of Genetic toxicology. Fleck, R.A.; Hollaender, A. (eds.). New York, NY; Plenum Publishing Corp. (1982).

The author raises questions concerning the use of chemicals in agriculture and the problems of environmental carcinogenesis. There is a need for tests which are sufficiently broad enough to identify all types of relevant genetic damage and sufficiently redundant to control false alarms. The relationship of mutagenesis and carcinogenesis is discussed. Scientists lack the technical skill to measure induced heritable mutation in man. The development of such tests will be a breakthrough. The author believes a data base containing a somatic mutagenicity profile on each new cancer patient would answer questions concerning the relationship between carcinogenesis and mutagenesis. Eventually the problem of mutagenic vectors in agriculture would be solved using appropriate testing methods. (RJC)

22015 **Cytochrome P_{450} dependent monooxygenases in nasal epithelial membranes: effect of phenobarbital and benzo(a)pyrene.** Hadley, W.M.; Dahl, A.R.; Benson, J.M.; Hahn, F.F.; McClellan, R.O. (Lovelace Inhalation Toxicology Research Inst., Albuquerque, NM). *Proceedings of the Western Pharmacology Society;* **25**: 197-199(1982). Contract AC04-76EV01013.

The cytochrome P-450 content of microsomes isolated from nasal membranes, lungs, and livers of the mouse, rat, guinea pig, hamster, rabbit, and dog was measured. The cytochrome P-450 dependent monooxygenase activity (MO) was assayed in microsomes from dog nasal membrane, lung, and liver using aniline, p-nitroanisole, aminopyrine and hexamethylphosphoramide (HMPA) as substrates. Phenobarbital was administered as a saturated drinking water solution for 8 days or as an aerosol for 30 minutes on 4 successive days. Benzo(a)pyrene was administered as an aerosol for 1 h on 4 successive days. The drinking water was removed 12 h before sacrifice and the last aerosol exposure was 24 h before sacrifice. All species nasal membranes contained cytochrome P-450. The hamster nasal membranes contained the highest concentrations. All substrates used were metabolized (as measured by MO activity) by the nasal membrane microsomes except for aminopyrine by the maxilloturbinate microsomes. HMPA was the most rapidly metabolized substrate. Liver cytochrome P-450 was induced more than 2 times by the phenobarbital administered in the drinking water, but no induction of nasal membrane cytochrome P-450 was found. Neither the phenobarbital nor benzo(a)pyrene aerosols induced the liver, lung, or nasal membrane cytochrome P-450 content. (RJC)

22016 **Inhibition of rat nasal cytochrome P-450-dependent mono-oxygenase by the essence heliotropin (piperonal).** *Drug Metabolism and Disposition;* **10**: No. 5, 553-554(1982). Contract AC04-76EV01013.

The purpose of this study was to determine if heliotropin can inhibit cytochrome P-450 mediated oxidations in both nasal and hepatic microsomes. Heliotropin was an effective inhibitor of the methylation of the common fragrance dimethyl anthranilate by nasal microsomes; little inhibition was observed in liver microsomes. If the strong inhibitory activity of heliotropin in the nose occurs in vivo, then the inhalation of heliotropin prior to or along with inhalation of other airborne substances might profoundly alter the biological fate of those substances. (RJC)

22017 **Toxicological characterization of the process stream from an experimental low Btu coal gasifier.** Benson, J.M.; Hill, J.O.; Mitchell, C.E.; Newton, G.J.; Carpenter, R.L. (Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM). *Archives of Environmental Contamination and Toxicology;* **11**: 363-371(1982). Contract AC04-76EV01013.

Samples were obtained from selected positions in the process stream of an experimental low Btu gasifier using a five-stage multicyclone train and a four-stage condenser train. These materials which represent potential fugitive emissions were screened for mutagenic activity (Ames Salmonella mammalian microsome mutagenicity assay) and for in vitro cytotoxicity (alveolar macrophages). Size-fractionated materials collected in the multicyclone train were mutagenic in Salmonella tester strains TA-98 and TA-100 and were also cytotoxic. There appeared to be no relationship between aerosol droplet size and mutagenic activity. Studies with condenser train samples indicate that neutral and basic polynuclear aromatic compounds contribute to the mutagenicity of process stream materials. Specific mutagenic and cytotoxic activity of material was reduced as gas underwent cleanup. A reduction in the mass loading of potentially toxic compounds is achieved by the control devices in the process stream of the experimental gasifier being developed and tested by METC, and assuming equal probability of emissions throughout the process stream, risk from exposure to potential fugitive emissions is reduced as the gas is cleaned.

22018 **Mutagenicity of potential effluents from an experimental low Btu coal gasifier.** Benson, J.M.; Mitchell, C.E.; Royer, R.E.; Clark, C.R.; Carpenter, R.L.; Newton, G.J. (Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM). *Archives of Environmental Contamination and Toxicology;* **11**: 547-551(1982). Contract AC04-76EV01013.

Potential waste effluents produced by an experimental low Btu coal gasifier were assessed for mutagenic activity in Salmonella strain TA98. Cyclone dust, tar and water effluents were mutagenic, but only following metabolic activation. Neutral and polar polycyclic aromatics contributed significantly to mutagenic activity of Venturi scrubber water and tar. The results indicate that cyclone dust, tar, and water effluents of the experimental low Btu gasifier, as operated in 1979, contain mutagenic material. Potential health hazards associated with these materials should be considered in the design of future coal gasification facilities.

22019 **Potential health risks from increased use of diesel light duty vehicles.** Cuddihy, R.G.; McClellan, R.O.; Griffith, W.C.; Seiler, F.A.; Scott, B.R. (Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM). pp 353-367 of Toxicological effects of emissions from diesel engines. Lewtas (ed.). New York, NY; Elsevier Science Publishing Co., Inc. (1982). Contract AC04-76EV01013.

Diesel light duty vehicles are expected to comprise 20% of the total light duty vehicle fleet in the United States within 15 years. Chemical analyses of diesel emissions have identified potentially toxic gases including nitrogen oxides and carbon monoxide along with particles that contain known carcinogenic compounds including polyaromatic hydrocarbons. Diesel particle extracts have been shown to be mutagenic to cells in culture, to cause cell transformations and to induce tumors in the skin of mice. Further studies have also shown that diesel particle extracts are not markedly different from extracts or condensates of cigarette smoke, coke oven emissions, or urban soot in their ability to cause these biological effects per unit mass. Atmospheric concentrations of particles emitted by diesel vehicles were projected for major cities in the United States using a computerized atmospheric dispersion model. This model predicted that with 20% diesel light duty vehicles the average city particulate pollution levels would increase by about 0.2 $\mu g/m^3$ over existing levels. The largest cities would be expected to have an overall increase of 1 to 2 $\mu g/m^3$ but in urban street canyons and parking garages diesel particles may add 20 to 30 $\mu g/m^3$ to the existing particulate concentrations. By using the results of previous epidemiological studies of smokers, coke oven workers and urban residents, we obtained an upper estimate of lung cancer risk that would be expected in people exposed to diesel exhaust particles.The risk estimator was taken to be 0.0015 cancers per year per mg/m^3 life-time exposure to diesel particles. Combining this risk factor with projected future air concentrations of diesel particles in urban environments, we estimated that less than 30 lung cancers per year could be related to the projected increased use of diesel light duty vehicles in the United States.

22020 **Cadmium as an etiologic factor in hypertension.** Ohanian, E.V.; Schlaechtelin, G.; Iwai, J. (Brookhaven National Lab., Upton, NY). pp 703-718 of Cadmium in the environment. Part II. Health effects. Nriagu, J.O. (ed.). New York, NY; John Wiley & Sons (1981).

The role of cadmium in experimental and human essential hypertension is discussed in this chapter. The discussion focuses on the conflicting results from different laboratories concerning the role of cadmium in experimental and human hypertensive disease, and on the nature of influences which determine differences in susceptibility to cadmium-induced hypertension in 2 unique lives of Long-Evans rats. (KRM)

22021 **(AD-A—115079/6) Possible effects of noise from offshore oil and gas drilling activities on marine mammals: a survey of the literature. Final report FY 80.** Turl, C.W. (Naval Ocean Systems Center, San Diego, CA (USA)). Jan 1982. 25p. (NOSC/TR—776). NTIS, PC A02/MF A01.

The acoustic environment in the area of offshore oil and gas drilling activities may influence the behavior of marine mammals. Increased noise levels may mask their acoustic signals. Offshore structures and the increased level of human activities in outer continental shelf areas could displace marine mammals from traditional feeding and breeding areas. No conclusions about the effects of noise on natural populations have been verified under controlled conditions.

22022 **(AD-A—115115/8) Dosimetric and behavioral analysis of microwave-drug synergistic effects on operant behavior in the rat. Final report Sep 79-Dec 81.** Lovely, R.H.; Lundstrom, D.L.; Phillips, R.D. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 18 Dec 1981. 26p. NTIS, PC A03/MF A01.

Five male Long-Evans rats, maintained at 80% of their free-feeding weight, were trained to bar-press for food reward on a one-minute fixed-interval (FI1) schedule of reinforcement. Once stable FI1 baseline response rates were established, dose-response functions were generated for Chlordiazepoxide HC1 (CDZ). Subsequent treatments with CDZ were followed by 30 min. pulsed microwave radiation (MWR) and FI1 behavioral assessment. Pulsed MWR exposures were in the far zone of an anechoic chamber at an averaged incident power density of 1 mW/sq cm (PRF = 300/sec, 3 usec pulse width). After 2 replications of the combined treatments another CDZ dose-response function was generated. This was followed by 3 more CDZ and MWR replications the first of which was carried out at an averaged incident power density of 1 mW/ sq cm2 Increased rates of response for the CDZ and 1 mW/sq cm MWR treatment were demonstrated relative to initial CDZ dose-response functions in 4 of 5 rats tested. However, the dose-response functions for CDZ alone, that were generated following this apparent synergy showed the same shift in response rate. Furthur, the 8 mW/sq cm 2 pulsed MWR combined with CDZ also produced data similar to the 1 mW/sq cm post-MWR exposure CDZ dose-response functions for the animals tested. Thus, we were unable to replicate an earlier demonstration of synergy between CDZ and MWR.

22023 **(DOE/ER/10060—T1) Responses of airborne biota to microwave transmission from satellite power system. Final report.** (Little (Arthur D.), Inc., Cambridge, MA (USA)). 3 Jun 1982. Contract AI01-79ER10060. 430p. NTIS, PC A19/MF A01. Order Number DE83006495.

As part of an assessment of environmental impacts of the Satellite Power System (SPS), the behavioral responses of birds to microwave radiation was studied. Experiments were conducted in both field and laboratory environments. Molting, foraging behavior, reproductive behavior, embryonic development, and flight behavior were examined. (ACR)

22024 **(PB—83-138768) A second field investigation of noise reduction afforded by insert-type hearing protectors.** Edwards, R.G.; Broderson, A.B.; Green, W.W.; Lempert, B.L. (Watkins and Associates, Inc., Lexington, KY (USA)). Apr 1982. 67p. NTIS, PC A04/MF A01.

Field testing of noise reduction by earplugs was done. Ten factories and 280 employees took 1400 attenuation tests. User molded, expandable acoustic foam, custom molded, and acoustic wool types of earplugs were evaluated. Workers received protection ranging from about 9 decibels at 125 hertz to 29 decibels at 3150 hertz. Acoustic foam earplugs provided the best hearing protection, and acoustical wool, the least. The authors conclude actual noise protection depends on earplug design.

22025 (PB—83-139576) Industrial hygiene walk-through survey report on RF radiation exposures from heat sealers at Hazel Incorporated, Washington, Missouri. Cox, C.; Egan, B.; Herrick, B.; Murray, B. (National Inst. for Occupational Safety and Health, Cincinnati, OH (USA)). 7 Feb 1979. 21p. NTIS, PC A02/MF A01.

Worker exposures to radiofrequency (RF) radiation were determined at Hazel Incorporated (SIC-3161) in Washington, Missouri on November 20, 1978. The company was under consideration for inclusion in a NIOSH study of the health effects of occupational RF exposure. The authors conclude that this workforce should not be included in RF radiation hazard survey because of the small number of affected workers. They recommend that shields be added to the heat sealing presses to reduce worker exposures to RF radiation.

22027 (ANL/NESC—930) LINSED; one-dimensional multireach sediment transport model. Fields, D.E. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048930.

LINSED consists of a driver program coupled with the SEDTRN model of sediment transport for a rectangular stream channel to allow simulation of sediment transport in a one-dimensional multi-reach channel system. The LINSED model can accept specification of a branching channel system of up to nine nominally homogeneous segments (reaches). Sediment input to each reach from external sources along the reach is permitted.IBM360,303x; FORTRAN IV; OS/360 (IBM360), OS/303x (IBM303x); 50,000 bytes of memory are required.

22028 (DOE/AL/10752—17) Hydrologic analyses of two brine encounters in the vicinity of the Waste Isolation Pilot Plant (WIPP) Site. Spiegler, P. (New Mexico Health and Environment Dept., Santa Fe (USA). Environmental Improvement Div.). Dec 1982. Contract AC04-78AL10752. 72p. NTIS, PC A04/MF A01. Order Number DE83007493.

The data from ERDA-6 indicates a naturally fractured reservoir of the two-porosity type. The best estimate of the volume is about 60 thousand to 120 thousand barrels. The data from WIPP-12 also indicates a naturally fractured reservoir of the two-porosity type. The best estimate of the volume is about 5 million to 10 million barrels. The excess pressure above hydrostatic pressure suggests that the reservoirs were formed many millions of years ago. The location of the fractures suggest that their formation may be connected to the tilting of the Delaware Basin as a unit. The effect of the flow testing data on a drilling scenario through the repository many years following its closure is evaluated.

22029 (DOE/ET/12138—1335) Field techniques for measuring joint intensity. Dixon, J.M. (West Virginia Univ., Morgantown (USA). Dept. of Geology and Geography). Sep 1979. Contract AC21-76ET12138. 15p. NTIS, PC A02/MF A01. Order Number DE83006561.

Hydrocarbon production from fractured reservoirs, increased water-well yields, coal mine roof falls, and some construction problems often have been cited as having been caused by an increase in fracture intensity. A relatively fast and easy method to measure fracture intensity and locating areas of intense fracturing would be generally useful, and in particular, in potential drilling areas where little or no subsurface data is available. As part of the Eastern Gas Shales Project, funded by the US Department of Energy, such a method was developed. This paper reports the summary of methods used, a test of operator variability, and a handbook of suggested procedures. 1 table.

22030 (LA—9616-T) Thermal and kinematic history of mantle xenoliths from Kilbourne Hole, New Mexico. Bussod, G.Y.A. (Los Alamos National Lab., NM (USA)). Feb 1983. Contract W-7405-ENG-36. 81p. NTIS, PC A05/MF A011. Order Number DE83008359.

A suite of spinel lherzolite xenoliths representing two distinct textural types provides evidence for vertical inhomogeneity within the upper mantle beneath Kilbourne Hole, New Mexico. Fine grained, tabular equigranular samples show a wider range of Mg/Fe ratios of their constituent phases than coarse, protogranular samples. These differences are correlated with generally higher bulk Fe and LREE contents in the former. The two lherzolite varieties also differ in the preferred orientations of olivine. The symmetry of olivine fabrics is orthorhombic for both types and is interpreted as resulting from preferential slip on [100] (010), the dominant slip system at high temperatures. However, the olivine fabrics in the protogranular samples are more nearly axial about [010], perhaps the result of a variation in mantle rheology with depth. Olivine fabrics from composite samples are more complex, though their symmetry is also dominantly orthorhombic. Weak girdles about a [010] maximum are typically present and may be due to the formation of pyroxenite or amphibole-bearing veins visible in these samples. Olivine-spinel (Fabries) and two-pyroxene (Wells) thermometers are in agreement indicating equilibration temperatures of 950° to 1050°C for the protogranular xenoliths. Discrepant results between the two thermometers for the tabular equigranular xenoliths are attributed to disequilibrium between the spinel and silicate phases, and not to inherent differences between the thermometers. These samples show evidence for a complex thermal history possibly related to the intrusion of basaltic magma prior to and during xenolith entrainment. Two independent barometric estimates tentatively place the tabular equigranular samples at shallower depths than the protogranular samples.

22031 (LBL—13600) Earth Sciences Division annual report 1981. (Lawrence Berkeley Lab., CA (USA)). Sep 1982. Contract AC03-76SF00098. 192p. NTIS, PC A09/MF A01. Order Number DE83004044.

Separate abstracts were prepared for the 59 papers of the 1981 annual report of the Earth Sciences Division at Lawrence Berkeley Laboratory. The general topics covered included nuclear waste isolation, geophysics and reservoir engineering, and geosciences. (KRM)

22032 (LBL—13600, pp 24-27) **Porous media equivalent for a network of discontinuous fractures.** Long, J.C.S. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

One of the important questions that arises when considering the flow of fluids through a discontinuous rock mass is whether the fracture network behaves as a porous medium. The work that has been done to determine the equivalent permeability of fractured rocks from information on fracture geometry (assuming an impermeable matrix) can be classified into the categories. Most of the work falls into the category in which fractures are assumed to be continuous, or of infinite extent (extensive fractures). Very little work has been done in the category in which fractures are assumed to be discontinuous, or of finite extent. It can be seen in the field that fractures are clearly of finite dimensions. The fact that fractures are finite means that each fracture can contribute to the permeability of the rock only insofar as it intersects other conducting fractures. In the extreme, an isolated fracture which does not intersect any other fracture effectively contributes nothing to the permeability of the total rock mass. This means that flow in any given fracture is not independent of flow in every other fracture.

22033 (LBL—13600, pp 28-31) **Determining size and interconnection of fractures from constant-head well tests.** Doe, T.; Endo, H. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

The ability of low-permeability rock to transmit water is determined by the interconnection of the fractures in the rock. The degree of interconnection is related to the basic geometric parameters of the fracture system - orientation, aperture, density (number of fractures per unit volume), and fracture area. The purpose of this program was to see if information on the areas, apertures, and interconnections of fractures could be obtained from well tests. Although the thrust of the work was toward single fracture tests, the results are applicable to test zones containing several fractures, as one should expect that the largest fracture in any given test zone will dominate the test behavior. A further objective was to see if conventional radial-flow well-test solutions could be applied to rock in which the flow conduits are finite fractures.

22034 (ONWI—356) **Permeability of selected sediments in the vicinity of five salt domes in the Gulf Interior Region.** Slaughter, G.M.; White, R.M.; Alger, R.P. (Law Engineering Testing Co., Marietta, GA (USA)). Feb 1983. Contract AC06-76RL01830. 76p. NTIS, PC A05/MF A01. Order Number DE83008126.

The purpose of this investigation was to determine what relationships might exist between permeability and parameters available from geophysical logs of sediments within the Gulf Interior Region. The parameters that have received the most attention in the literature are formation resistivity factor and porosity. Empirical relationships between permeability and porosity, gamma-ray bulk density, the fraction of intergranular pore space occupied by clay or silt, and porosity differences were investigated. Porosity appears to be the log parameter that best correlates with permeability.

22035 (RHO-BWI-LD—9) **Geology of the Wallula Gap Area, Washington.** Gardner, J.N.; Snow, M.G.; Fecht, K.R. (Rockwell International .Corp., Richland, WA (USA). Rockwell Hanford Operations). Dec 1981. Contract AC06-77RL01030. 101p. NTIS, PC A06/MF A01. Order Number DE83007027.

This study focuses on the structure and stratigraphy of an 80-km^2 area at the southern margin of the Pasco Basin in Wallula Gap. Field stratigraphy, petrography, natural remanent magnetism, and major-element chemistry indicate that the tholeiitic basalt flows of the Wallula Gap area correlate with units of the Grande Ronde, Wanapum, and Saddle Mountains Formations of the Yakima Subgroup of the Columbia River Basalt Group. Flows of the Frenchman Springs, Umatilla, Pomona, Elephant Mountain, and Ice Harbor Mmebers are present in the area. The Frenchman Springs Member exposed in the Wallula Gap is more than 185 m thick and consists of eight to nine flows. Its thickness and possible contemporaneous structural deformation apparently prevented emplacement of both the Roza and Priest Rapids Members at this locality. Structural uplift of the Horse Heaven Hills began prior to extrusion of the Pomona flow. Both the Pomona and Elephant Mountain Members thin and pinch out over the crest of the uplift near Mound Pond. The Ice Harbor flow was apparently confined to the basin north of the Horse Heaven uplift, but an exposure at Mound Pond suggests it flowed through Wallula Gap as an intracanyon flow. The Wallula Gap fault zone trends N65°W and can be traced for at least 11 km along the north flank of the Horse Heaven Hills uplift. Where the fault intersects the Olympic-Wallowa Lineament at Van Sycle Canyon 8 km east of Wallula Gap, it is a broad zone of normal faulting, 300 m wide, with as much as 310 m of displacement of the basalt stratigraphy. Two faults occur in the northern portion of Van Sycle Canyon and define a graben trending N45°W. A third fault, roughly parallel to the Wallula Gap fault, transects the The Nub and offsets 14 m of Ice Harbor basalt.

22036 **(AD-A—115024/2) Users' manual for SNAP/D: seismic network assessment program for detection. Final report.** Ciervo, A.P.; Sanemitsu, S.K.; Snead, D.E.; Suey, R.W. (Pacific Sierra Research Corp., Santa Monica, CA (USA)). Sep 1980. 179p. (PSR—1027). NTIS, PC A09/MF A01.

This report is a user's manual for SNAP/D (Seismic Network Assessment Program for Detection), a computer model designed for assessing the ability of a network to detect and locate seismic events (i.e., earthquakes or explosions). Part I presents the analytical structure of the model, whereas Part II documents the computer code.

22037 **(CNEN-RT/AMB—(81)11) Seismic data summary for the colli albani area.** Molin, D. (Comitato Nazionale per l'Energia Nucleare, Casaccia (Italy). Dipartimento Radiazioni e Ricerche di Sicurezza e Protezione). 1981. 119p. (In Italian). Dep. NTIS (US Sales Only), MF/A01. Order Number DE82903052.

Following the shocks recorded in April and May, 1981, in the Colli Albani area, data regarding historical seismicity have been requested by local civil services. Macroseismic catalogue and isoseismic map Atlas regarding the above mentioned area are supplied. Considerations on distribution of shocks in time domain, on main earthquakes and maximum historical intensity are then discussed.

22038 **(E—82-10011) Geologic applications of thermal-inertia mapping from satellite. Final report.** Offield, T.W.; Watson, K.; Hummer-Miller, S. (Geological Survey, Denver, CO (USA)). Jul 1981. 109p. NTIS, PC A06/MF A01.

In the Powder River Basin, Wyo., narrow geologic units having thermal inertias which contrast with their surroundings can be discriminated in optimal images. A few subtle thermal inertia anomalies coincide with areas of helium leakage believed to be associated with deep oil and gas concentrations. The most important results involved delineation of tectonic framework elements some of which were not previously recognized. Thermal and thermal inertia images also permit mapping of geomorphic textural domains. A thermal lineament appears to reveal a basement discontinuity which involves the Homestake Mine in the Black Hill, a zone of Tertiary igneous activity and facies control in oil producing horizons. Applications of these data to the Cabeza Prieta, Ariz., area illustrate their potential for igneous rock type discrimination. Extension to Yellowstone National Park resulted in the detection of additional structural information but surface hydrothermal features could not be distinguished with any confidence. A thermal inertia mapping algorithm, a fast and accurate image registration technique, and an efficient topographic slope and elevation correction method were developed.

22039 **(E—82-10153) Application of hcmm data to regional geologic analysis for mineral and energy resource evaluation.** Watson, K.; Miller, S.H. (Geological Survey, Denver, CO (USA)). Nov 1981. 4p. (NASA-CR—168538). NTIS, PC A02/MF A01.

Sponsored by NASA HCMM.

A more accurate algorithm was developed to compute thermal inertia from temperature difference and albedo information. The error of this algorithm is about 1/3 of the measurement error in HCMM as opposed to the current algorithm which can have an error 5 times larger. A northeast trending lineament was discovered in southewestern Arizona on enhanced thermal inertia images.

22040 (E—82-10243) **Application of HCMM data to regional geologic analysis for mineral and energy resource evaluation.** Watson, K.; Miller, S.H. (Geological Survey, Denver, CO (USA)). May 1981. 4p. (NASA-CR—168824). NTIS, PC A02/MF A01.

Sponsored by NASA HCMM.

The effects of topographic elevation and slope on thermal images were examined using representative field obstructions of the solar and sky radiation and a simple linearized thermal model. The forms are easily adapted for analysis of HCMM images using the DMA digital terrain data. From a representative set of field observations, it was found that flux variations with elevation can cause changes in the mean diurnal temperature gradient from -4 deg to -14 deg per km evaluated at 2000 m. Changes in the temperature difference gradient of 1 to 2 C per km are also produced which is equivalent to an effective thermal inertia gradient of 100 W s to the 1/2 power/sq m K/1 per km. Exposed bedrock on topographic ridges will appear to have a lower thermal inertia due to the additional effect.

22041 (E—82-10244) **Investigation from Japanese MAGSAT team. Part a. crustal structure near Japan and in antarctic station. Part b. electric currents and hydromagnetic waves in the ionosphere and the magnetosphere.** Fukushima, N. (Tokyo Univ. (Japan)). Dec 1981. 13p. (NASA-CR—168825). NTIS, PC A02/MF A01.

Preliminary results of MAGSAT data analysis are described. Regional anomaly maps (deviations from the MGST model field) for X,Y,Z, and F in the area of 115 to 155 deg E and 20 to 60 deg N were obtained. A similar map for the geomagnetic total force anomaly in the vicinity of Japan showed that the observed anomaly can be explained by the difference in crustal magnetization between the Japan Sea and the Japan Island, which reflects a difference of 25 km in the thickness of the magnetized layer. The MAGSAT record of a sudden commencement of a magnetic storm above the South Atlantic Ocean showed a reverse impulse particularly in the D-component. Results relating to toroidal currents in the ionosphere, transverse and parallel perturbations over the polar regions, the relationship between field aligned currents and precipitating electrons, and the calculation of the subsatellite electric field are also discussed.

22042 (E—82-10249) **Geological and geothermal investigations for HCMM-derived data. Final report, June 1977 - June 1981.** Lyon, R.J.P.; Prelat, A.E.; Kirk, R. (Stanford Univ., CA (USA)). Jun 1981. 146p. (NASA-CR—168830). NTIS, PC A07/MF A01.

An attempt was made to match HCMM- and U2HCMR-derived temperature data over two test sites of very local size to similar data collected in the field at nearly the same times. Results indicate that HCMM investigations using resolutions cells of 500 m or so are best conducted with areally-extensive sites, rather than point observations. The excellent quality day-VIS imagery is particularly useful for lineament studies, as is the DELTA-T imagery. Attempts to register the ground observed temperatures (even for 0.5 sq mile targets) were unsuccessful due to excessive pixel-to-pixel noise on the HCMM data. Several computer models were explored and related to thermal parameter value changes with observed data. Unless quite complex models, with many parameters which can be observed (perhaps not even measured) only under remote sensing conditions (e.g., roughness, wind shear, etc) are used, the model outputs do not match the observed data. Empirical relationship may be most readily studied.

22043 (E—82-10306) **Investigation of the effects of external current systems on the MAGSAT data utilizing grid cell modeling techniques.** Klumpar, D.M. (Texas Univ., Richardson (USA)). Apr 1982. 11p. (NASA-CR—168881). NTIS, PC A02/MF A01.

ERTS.

Progress made in reducing MAGSAT data and displaying magnetic field perturbations caused primarily by external currents is reported. A periodic and repeatable perturbation pattern is described that arises from external current effects but appears as unique signatures associated with upper middle latitudes on the Earth's surface. Initial testing of the modeling procedure that was developed to compute the magnetic fields at satellite orbit due to current distributions in the ionosphere and magnetosphere is also discussed. The modeling technique utilizes a linear current element representation of the large scale space current system.

22044 (E—82-10308) **Investigation of Antarctic crust and upper mantle using MAGSAT and other geophysical data.** Bentley, C.R. (Wisconsin Univ., Madison (USA)). Jan 1982. 1p. (NASA-CR—168883). NTIS, PC A02/MF A01.

ERTS.

Development of a spectral analysis technique to determine the depth to the Curie Isotherm from MAGSAT data over Antarctica is reported. The analysis of the power spectra of a number of MAGSAT passes over Antarctica indicates on the average two power maxima for each flight pass, one with spatial wavelength of approximately 2000 km and the other with a wavelength of approximately 700 km. It was not determined whether these spectral peaks are geological or mathematical in origin.

22045 (E—82-10319) **The crustal structure and tectonics of South America.** Keller, G.R.; Lidiak, E.G. (Texas Univ., El Paso (USA)). Sep 1981. 4p. (NASA-CR—168898). NTIS, PC A02/MF A01.

A preliminary crustal structure map and a bibliography of crustal and upper mantle studies for South America are given. Work on the surface wave analysis and tectonic characterizations continues.

22046 (E—82-10320) **Geotectonics of South America.** Keller, G.R.; Lidiak, E.G. (Texas Univ., El Paso (USA)). Mar 1982. 36p. (NASA-CR—168899). HC A03/MF A01.

Preliminary satellite scalar magnetic anomaly data (MAGSAT) reduced to vertical polarization and long wavelength-pass filtered free air gravity anomaly data of South and Central America are compared to major tectonic features. In addition, a geotectonic overview of South America is presented.

22047 (LBL—13600, pp 72-75) **Geophysical borehole measurements in low-permeability rock.** Nelson, P.H.; Rachiele, R. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

Geophysical methods respond to the presence of discontinuities in rock, to the mineralogical properties, and to properties of fluids saturating the pore space. In the following examples, permeability variations inferred from geophysical logs by simple inspection and correlation are compared with hydrologic permeability determiations. In addition, a new method of permeability profiling is illustrated by flow logs obtained with dissolved radon, a naturally occurring radioactive tracer. All the records shown are from the field project at Stripa, Sweden. Boreholes SBH-1 and SBH-3, inclined at 45 degrees, penetrated a metamorphic (leptite) sequence and a granitic (quartz monzonite) pluton. The 3-in.-diameter boreholes were logged with geophysical probes before permeability determinations were made with injection methods on intervals isolated with packers.

22048 (LBL—13600, pp 85-86) **Electromagnetic modeling using a fast numerical Sommerfeld integral.** Lee, K.H.; Morrison, H.F. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

The successful application of electromagnetic techniques in the search for anomalously conductive structures in the earth requires a means for rapid calculation of the response of three-dimensional bodies to dipole and plane wave fields. In the integral equation modeling technique, as in other useful techniques, a great number of Green's functions of the Sommerfeld integral type must be numerically computed. Such integrals are evaluated primarily by means of a Gaussian quadrature integration technique, the convergence of which can be accelerated using Euler's transformation. A recently developed numerical convolution or digital filter technique has become popular for calculating various Green's functions. The method avoids the evaluation of the Bessel function and appears to be about an order of magnitude faster than the Gaussian quadrature technique.

22049 (LBL—13600, pp 95-98) **Application of ASP: an Automated Seismic Processor.** Majer, E.L.; McEvilly, T.V. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

For the past several years, the Seismographic Station of the University of California, Berkeley, and Lawrence Berkeley Laboratory have been developing an in-field, low-power, real-time processor for microearthquake data. The objective is to utilize CMOS microprocessor technology (RCA 1802) to automate the routine, labor-intensive processing of microearthquake survey data. The Automated Seismic Processor (ASP) is presently set up to handle 15 channels of data, although the system is configured for up to 128 channels. A WORKER computer on each channel automatically detects P- and S-waves, measures their arrival times and amplitudes, and computes and fits FFT's for both waves on data sampled at 100 samples/s. These data from each channel are then processed with a central microprocessor (the BOSS) for hypocenter location, running b-values, source parameters, event count, and P-wave polarities. The system is capable of processing a 15-station detection in approximately 40 s, excluding printout. The initial trials have demonstrated that in-field, real-time analysis of data maximizes the efficiency of microearthquake surveys, allowing flexibility in experimental procedures with a minimum of the traditional labor-intensive postprocessing. Current efforts are directed toward improving efficiency of computation and data output and toward expanding software capabilities.

22050 (NP—3901011) **Determination of lateral inhomogeneities in seismics by means of inversion of transit time anomalies.** Neumann, G. (Technische Univ. Berlin (Germany, F.R.). Fachbereich Bergbau und Geowissenschaften). 24 Apr 1981. 123p. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number DE83901011.

A method for the inversion of transit time residues has been studied with respect to a possible application in the field of applied seismology to localise lateral inhomogeneties. At first the resulting systems of linear, inhomogeneous equations are solved by a damped version of the method of generalized matrix inversion where a separation of the data matrix in eigenvalues and eigenvectors is necessary. A two-dimensional ansatz has been selected, as the measurements in explorational seismology are very often performed along profiles. This ansatz has been tested in the evaluation of model experiments to determine transit-time anomalies in transmission, reflection and refraction. Results are presented of seismic velocity distributions for models with circular and squared inhomogenities, for a trough model and well as for an edge model. The influence of the necessary damping measures on the solution and the propagation of measuring errors and linearisation errors is discussed. Velocity contrasts of 20% are found to be admissible, although large linearisation errors are obtained for velocity contrasts above 5%.

22051 (NUREG/CR—3079) **Earthquake hazard studies in New York State and adjacent areas. Final report, April 1976-June 1982.** Kufka, A.L. (Columbia Univ., Palisades, NY (USA). Lamont-Doherty Geological Observatory). Jan 1983. 76p. NTIS, PC A05/MF A01 - GPO $5.00. Order Number DE83901345.

Lamont-Doherty Geological Observatory (LDGO) currently operates a network of 38 short period seismic stations in the states of New York, New jersey and Vermont. It is part of the larger Northeastern United States Seismic Network (NEUSSN) operated by several university groups in New York, New Jersey, Pennsylvania and New England. These networks provide a wealth of data to study seismicity, earthquake hazards, earthquake source properties, tectonic processes, and crustal and upper mantle structure in the northeastern United States and adjacent parts of Canada. The LDGO network provides data for more specific studies of earthquake processes in New York State and adjacent areas. This report discusses results of research related to the operation of the network and also introduces current directions of research for future studies.

22052 (NUREG/CR—3109) **Seismicity and tectonic relationships of the Nemaha Uplift in Oklahoma. Part V. Final report.** Luza, K.V.; Lawson, J.E. Jr. (Oklahoma Univ., Norman (USA)). Feb 1983. 127p. NTIS, PC A07/MF A01 - GPO $5.50. Order Number DE83901537.

The Nemaha Ridge is composed of a number of crustal blocks typically 3 to 5 miles (5 to 8 km) wide and 5 to 20 miles (8 to 32 km) long. Structure-contour maps prepared of the top of the Viola Formation (Ordovician), the base of the Pennsylvanian, and the top of the Oswego Formation (Middle Pennsylvanian) reveal a complex fault pattern associated with the Nemaha Uplift. This fault pattern is dominated by several discontinuous uplifts, such as the Oklahoma City, Lovell, Garber, and Crescent Uplifts. A detailed study of the Oklahoma City Uplift suggests that a number of the Nemaha-related faults were developed in pre-Mississippian time. Many of these faults exhibit both increasing and decreasing displacements from early to late Paleozoic time. However, the displacement for most of the Oklahoma City faults took place between the end of Oswego time and the end of Hunton time. A lineament map was prepared for north-central Oklahoma. A detailed gravity map was prepared for the Kingfisher and Medford maxima. A total-intensity aeromagnetic map for the Enid and Oklahoma City 1° by 2° Quadrangles was prepared. A regional seismograph network was established to supplement existing seismological capability. A local earthquake-location program, named HYPERCUBE, was developed. From 1897 through 1976, Oklahoma has had approximately 128 known earthquakes. After the network became operational in late 1977, 255 additional earthquakes were detected in Oklahoma (through 1981). A study of earthquake distribution and intensity values in Oklahoma led to the development of a seismic-source map for Oklahoma and parts of the adjacent states. Six seismic-source zones were identified. For each zone except one, a magnitude-frequency relationship was determined.

22053 (PB—81-249724) **Probabilistic analysis for liquefaction.** Yegian, M.K.; Vitelli, B.M. (Northeastern Univ., Boston, MA (USA)). Mar 1981. 109p. NTIS, PC A06/MF A01.

A comprehensive review of liquefaction case histories was made and an expanded data set was prepared. The newly compiled field data are presented together with a criterion for liquefaction based on the field observations of liquefaction and nonliquefaction. A simple model for calculating the probability of liquefaction conditional to the occurrence of a particular seismic event is given. Applications of the proposed criterion and the probability model are discussed and comparisons are made between the results of this research and those previously published. Specific applications of the proposed method include an evaluation of overall liquefaction risk at a site and estimation of earthquake-generated excess pore pressures. It is concluded that liquefaction analysis procedures, which are invariably based on field observations, include significant uncertainties because of the imperfect nature of the data used. Use of the probability model presented herein permits proper evaluations of these uncertainties.

22054 (PNL—4562) **User's manual for geophysical well-logging software programs.** Petrie, G.M.; Gibson, D.; Blair, S.C. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1983. Contract AC06-76RL01830. 93p. NTIS, PC A05/MF A01. Order Number DE83008203.

Since 1958 the Ground-Water Surveillance Program for the Hanford Site has made geophysical logging measurements in most of the 800 wells and deep boreholes that have been drilled on the Hanford Site. In 1980 the Pacific Northwest Laboratory (PNL), which conducts the Ground-Water Surveillance Program, began forming a computerized data base for storing and retrieving geophysical well log data and developing software for quantitative analysis of the well log data. This report, designed to serve as a user's guide, documents the data base system that handles the well log data. Two programs, DIGLOG1 and LOGIT, are used to manipulate the data. The program DIGLOG1 translates analog paper strip charts into digital format; the program LOGIT is a general utility program that edits, displays, checks, stores, writes, and deletes sets of well log data. These two programs do not provide sophisticated display and analytical capabilities; rather, they provide programs that give the user easy access to powerful standard analytical software.

22055 **Constitutive laws, tensorial invariance and chocolate cake.** Rundle, J.B.; Passman, S.L. (Sandia National Labs., Albuquerque, NM). *Geophysical Surveys;* **5**: 3-36(1982). Contract AC04-76DP00789.

Although constitutive modeling is a well-established branch of mathematics which has found wide industrial application, geophysicists often do not take full advantage of its known results. We present a synopsis of the theory of constitutive modeling, couched in terms of the simple material, which has been extensively studied and is complex enough to include most of the correct models proposed to describe the behavior of geological materials. Critical in the development of the theory are various invariance requirements, the principal ones being coordinate invariance, peer group invariance (isotropy), and frame-indifference. Each places distinct restrictions on constitutive equations. A noncomprehensive list of properly invariant and commonly used constitutive equations is given. To exemplify use of the equations, we consider two problems in detail: steady extension, which models the commonly performed constant strain rate triaxial test, and simple shearing. We note that each test is so restricted kinematically that only the most trivial aspects of material behavior are manifested in these tests, no matter how complex the material. Furthermore, the results of one test do not generally determine the results of the other.

22056 **Relationship between microseismicity and high pore pressures during hydraulic stimulation experiments in low permeability granitic rocks.** Pearson, C. (Los Alamos National Lab., NM). *Journal of Geophysical Research;* **86**: No. B9, 7855-7864(10 Sep 1981).

Several hundred microearthquakes with local magnitudes ranging between -4 and -2 were recorded during hydraulic stimulation experiments at the hot dry rock demonstration site, Fenton Hill, New Mexico. These events are probably caused by shear failure induced by high pore fluid pressures. Since the event locations seem to cluster in a narrow band near the hydraulic fracture, we were able to use microseismic techniques to locate the hydraulic fracture and monitor its growth. We calculate the minimum pore pressure increase necessary to induce rock failure using a simple model of slippage on preexisting fractures. By comparing a pore pressure distribution, calculated using a one-dimensional diffusion model with the distribution of event foci, we demonstrate that high pore pressures are a probable cause for these microearthquakes. Stress drops for these microearthquakes, calculated from spectral parameters, increased by a factor of 3 during the course of the experiment. The stress drop increase correlates with a migration of seismic activity away from the injection well bore, which suggests relatively low in situ shear stresses near the well bore caused by strain release in this region during previous pressurizations.

REFER ALSO TO CITATION(S) 19767, 19849, 19851, 19858, 21197, 22030, 22056

22057 **(DOE/ER/10361--T1) Mechanical and transport properties of rocks at high temperatures and pressures. Task III. Technical progress report Number 3, 1 March 1982-30 October 1982.** Friedman, M.; Handin, J.; Bauer, S.J. (Texas A and M Univ., College Station (USA). Center for Tectonophysics). Nov 1982. Contract AS05-79ER10361. 112p. NTIS, PC A06/MF A01. Order Number DE83007278.

In an effort to characterize the rheology and flow processes (mechanisms of deformation) operative for presupposed semi-brittle behavioral conditions we have conducted a series of drained constant stress creep tests on 2 x 4 cm specimens of dry and water-saturated (Pp = 100 MPa) Westerly Granite at 100 MPa effective confining pressure and temperatures of 300°C to in excess of Tm (1000°C). The deformation is multimechanistic; microfracturing of apparent extensile and shear origin, glide in quartz and biotite, microfracture healing, dissolution, and mineral alteration are mechanisms observed and evaluated as functions of temperature and strain. We attempt to partition the bulk specimen deformation into that contributed by the individual mineral species in the analysis. Available equations of flow and time to failure are used as response models to characterize the experimental data even though the multimechanistic deformation described above and the quasi-steady state are not compatible with the assumptions underlying the corresponding theories. Data for 600°C and below (the brittle field) are well fit by an equation of the form: t/sub failure/ = t_0 p/sub - α/ exp (E/RT -Kσ), which has been shown to predict the static fatigue time for rock. Using this expression, we calculate apparent activation energies for the total fatigue processes in the α-quartz field of 7.5 kcal/mole (300 to 400°C, dry) and 21.6 kcal/mole (400 to 600°C, wet, Pp of 100 MPa. Quasi-steady state flow is observed in the β-quartz field (700 to 800°C) and the flow behavior is described by e = A exp (-Q/RT)σ/sup n/, where Q = 68 kcal/mole, n = 2.7, and A = 25.2.

22058 **(LA--9481-MS) Sentinel Gap basalt reacted in a temperature gradient.** Charles, R.W.; Bayhurst, G.K. (Los Alamos National Lab., NM (USA)). Jan 1983. Contract W-7405-ENG-36. 31p. NTIS, PC A03/MF A01. Order Number DE83008281.

Six basalt prisms were reacted in a controlled temperature gradient hydrothermal circulation system for two months. The prisms were centered at 72, 119, 161, 209, 270, and 310°C. Total pressure was 1/3 kbar. All prisms showed large weight loss: 5.5% to 14.9%. The matrix micropegmatite and natural nontronitic alteration reacted readily to clays at all temperatures. The first four prisms were coated with a calcium smectite, and the last two prisms were covered with discrete patches of potassium-rich phengite and alkali feldspar. The results indicated that clays may act as adsorbers of various ions.

22059 (LBL--13600, pp 22-23) **Theoretical model of fluid flow through a deformable rock fracture.** Tsang, Y.W.; Witherspoon, P.A. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

A simple theoretical model has been developed to understand the effect of normal stress on flow through a single rough-walled fracture. In order to gain a fundamental understanding of the problem, we have made several simplifying physical assumptions and have excluded the use of arbitrary fitting parameters.

22060 (LBL--13600, pp 75-78) **Development, verification, and application of modeling techniques for thermomechanical analysis.** Chan, T.; Wilson, E.L. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

The Stripa heater tests have provided a comprehensive data base for the thermomechanical response of a granitic rock mass. Preliminary linear thermoelastic calculations using constant rock properties measured from one or two small specimens did not accord well with field data. Following the completion of data based preparation, a project was established to develop improved analytical and numerical models to simulate thermally induced rock deformations and stresses. This paper summarizes the status of model development, verification, and application as of September 30, 1981.

22061 (LBL--13600, pp 79-82) **Measurement of low rates of water inflow by monitored evaporation in the large-scale permeability experiment at Stripa.** McPherson, M.J. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1980.

The low rates of water inflow to the heading used for the large-scale permeability experiment at Stripa were quantified by monitoring the water-vapor content of the ventilation air. Coupled with measurements of water pressure in sealed sections of boreholes, the data could be utilized to evaluate the macropermeability of the fractured granite around the heading. Transient effects on the apparent water inflow were noted after changes were made in the room temperature or airflow. These were shown to be caused by mixing processes within the room and self-correcting variations in the rate of evaporation from the rock walls. This report analyzes the results of moisture pickup and examines the time transients that occurred during the course of the experiment.

22062 (LBL—13600, pp 177-180) **Measurement of in situ stress using NQR/NMR.** Schempp, E.; Murdoch, J.B.; Klainer, S.M. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

The measurement of stress in rocks underground is a difficult but very important problem in mining engineering and in the design of underground waste repositories. The structural stability of any excavation is critically dependent on the stress distribution in the surrounding rock and its capability to bear the stress, which can build up to hundreds of atmospheres in deep mines. Because existing methods for the determination of stress have limitations, Lawrence Berkeley Laboratory (LBL) has been investigating the use of spectroscopic techniques - nuclear quadrupole resonance (NQR) and nuclear magnetic resonance (NMR) - for rapid in situ measurements of three-dimensional stress in both salt and hard rock. Efforts in the past year have been directed toward computer simulation of borehole stress patterns and NQR lineshapes, laboratory measurements on salt and aluminosilicates, and construction of a state-of-the-art pulsed NQR spectrometer.

22063 (ONWI—355) **Salt, caprock, and sheath study.** Karably, L.S. Jr.; Jernigan, B.L.; Petre, I.C.; Sullivan, J.M. (Law Engineering Testing Co., Marietta, GA (USA)). Jan 1983. Contract AC06-76RL01830. 112p. NTIS, PC A06/MF A01. Order Number DE83008119.

Salt domes of the Gulf Coast region of the United States consist of four component parts: 1) a salt stock, 2) caprock material, 3) sheath material, and 4) the surrounding upturned sediments. Salt stock consists of remarkably pure halite (NaCl), which represents 90 to 99% of the total mass, with the major impurity being anhydrite. Salt stocks are markedly homogeneous and continuous with respect to composition, texture and structure. Caprock consists primarily of anhydrite, gypsum and calcite which commonly occur in monomineralic zones oriented roughly parallel to the top of the salt stock. Caprock composition varies markedly over any single salt stock as well as from one salt stock to another. Fracturing, porosity and permeability of caprock material are correspondingly variable, but are usually developed tto a higher degree in the upper portions of caprock; porosity and permeability may also be relatively high at the caprock-salt interface. Caprock is generally believed to form by residual accumulation of anhydrite from the dissolution of salt, with subsequent alteration of the anhydrite to calcite and gypsum. Sheath material, probably a mixture of sedimentary rocks (clastic and evaporite), formed as a result of mechanical interaction between the salt stock and surrounding sediments during diapirism. Sheath material is thought to be distributed throughout an external zone, consisting mainly of disturbed sediment, and an internal zone, consisting mainly of disturbed salt. Sheath material forms along a roughly cylindrical shear zone which encloses thesalt stock. Sheath material may be overpressured and is generally thought to be impermeable. Upturned sediments around the salt diapirs are the result of dome genesis; hovever, these sedimentary beds and other structures are beyond the scope of this report.

22064 **Some mechanisms of microcrack growth and interaction in compressive rock failure.** Dey, T.N. (Univ. of California, Berkeley); Wang, C.Y. *International Journal of Rock Mechanics and Mining Sciences and Geomechanics Abstracts;* **18**: 199-209(1981).

Under uniaxial or triaxial load, stress inhomogeneities are generated in crystalline rock at point contacts and at boundaries between grains of dissimilar elastic constants. These stress inhomogeneities may be responsible for the extension of dilatant cracks. Theoretical models are developed to study these possibilities. The models predict axial splitting in rocks under uniaxial compression. Application of moderate confining pressures severely limits crack extension and thus inhibits axial splitting. Interaction between cracks, together with these stress inhomogeneities, tends to form a zone of intense deformation inclined 30 to 40° to the maximum principal stress where larger angles are associated with higher confining pressures. The axially-oriented cracks in such a zone tend to grow towards each other and thus may coalesce to form the diagonal macroscopic fracture found in brittle rocks under triaxial conditions.

22065 (CONF-810378—3) **Aspects of the history of 66095 based on trace elements in clasts and whole rock.** Jovanovic, S.; Reed, G.W. Jr. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 26p. NTIS, PC A03/MF A01. Order Number DE83007665.

From 12. lunar and planetary science conference; Houston, TX, USA (16 Mar 1981).

Large fractions of Cl and Br associated with separated anorthositic and basaltic clasts and matrix from rusty rock 66095 are soluble in H_2O. Up to two orders of magnitude variation in concentrations of these elements in the breccia components and varying H_2O-soluble Cl/Br ratios indicate different sources of volatiles. An approximately constant ratio of the H_2O to acid soluble Br, i.e. surface deposits vs possibly phosphate related Br, suggests no appreciable alteration in the original distributions of this element. Weak acid leaching dissolved $\sim$ 50% or more of the phosphorus and of the remaining Cl from most of the breccia components. Clast and matrix residues from the leaching steps contain, in most cases, the Cl/P_2O_5 ratio found in 66095 whole rock and in a number of other Apollo 16 samples. No dependence on degree of brecciation is indicated. The clasts are typical of Apollo 16 rocks. Matrix leaching results and element concentrations suggest that apatite-whitlockite is a component of KREEP.

22067 (LBL—13600, pp 171-172) **Geoanalytical and chemical bonding studies using modern surface techniques.** Perry, D.L. Sep 1982. NTIS, PC A09/MF A01.

In Earth Sciences Division annual report 1981.

In the last several years, a number of new instrumental surface techniques have been developed that are quite effective in detecting changes in the surfaces of minerals that have undergone chemically induced reactions or natural geologic alteration. These techniques are quite sensitive, and they make it possible to monitor very small amounts of elements that may be present on the mineral surfaces. Thus, any change in the surface due to chemical composition or bonding may be readily measured qualitatively and, in some cases, quantitatively. Surface measurements as part of a mineral geochemical study have several advantages. Several of the more widely used techniques are discussed below.

22068 (AD-A—099475) **Analysis of a series of solar flare x-ray spectra.** Mckenzie, D.L.; Landecker, P.B. (Aerospace Corp., El Segundo, CA (USA)). May 1981. 42p. NTIS, PC A03/MF A01.

REFS.

Thirteen X-ray line spectra (7.8 to 23.0 A) acquired during a solar flare that peaked at 2326 UT were analyzed. The data include fluxes of lines excited throughout the temperature range present in the coronal flare. The coronal flare emission measure began to decrease 500 s or less after the broad band X-ray flux peaked. The differential emission measure was calculated from the data by using collision strengths for a small number of the observed lines.

22069 (AD-A—115505/0) Experimental comprehensive solar flare indices for 'major' and certain lesser flares 1975-1979. Dodson, H.W.; Hedeman, E.R. (World Data Center A for Solar-Terrestrial Physics, Boulder, CO (USA)). Jul 1981. 41p. (UAG—80). Availability: World Data Center A for Solar-Terrestrial Physics, NOAA, Boulder, CO 80303. HC $2.00 (No copies furnished by DTIC).

In July 1971 a report on 'An Experimental, Comprehensive Flare Index and its Derivation for 'Major' Flares, 1955-1969' was published by the present authors as Report UAG-14 of World Data Center A for Solar-Terrestrial Physics. The index apparently proved to be a useful tool for some investigators, and values of the indices for the later years, 1970-1974, were published in Report UAG-52, 'Experimental Comprehensive Solar Flare Indices for Certain Flares, 1970-1974'. Requests have been received for values of the Comprehensive Flare Index (CFI) for still later years. Accordingly, the present report has been prepared for 1975 through 1979, years that complete data for solar cycle 20 and provide information for the ascending branch of cycle 21. (For November-December 1979, it was necessary to use preliminary summaries of flare data. Final Ha flare evaluations were not available for these months at the time of preparation of this report.)

22070 (AD-A—115527/4) Evolutionary charts of solar activity (calcium plages) as functions of heliographic longitude and time 1964-1979. Hedeman, E.R.; Dodson, H.W.; Roelof, E.C. (World Data Center A for Solar-Terrestrial Physics, Boulder, CO (USA)). Aug 1981. 120p. (UAG—81). Availability: World Data Center A for Solar-Terrestrial Physics, NOAA, Boulder, CO 80303 HC$4.00 (No copies furnished by DTIC/NTIS).

The richness and diversity of data relating to solar activity present a challenge from the point of view of organization and evaluation. For phenomena such as plages and centers of activity that tend to last for more than one solar rotation, we have prepared a sequence of 'evolutionary charts' based on heliographic longitude for successive solar rotations. Such a diagrammatic representation of calcium plages as a function of longitude and time, coupled with considerations of heliographic latitude, permits relatively easy and confident recognition of successively returning centers of activity. In past years, certain studies of solar activity prepared at the former McMathHulbert Observatory of the University of Michigan have used the format of such evolutionary charts to organize the chromospheric aspects of long enduring solar activity for time intervals of several years. These charts have proved useful in recognizing patterns of large scale organization on the sun. It is possible that solar activity organized in this manner for 16 years, somewhat more than an entire solar cycle, can provide guidance for the interpretation of other aspects of solar activity and of phenomena of the interplanetary medium including sector boundaries, geomagnetic activity, energetic particle events and solar wind streams. To this end, evolutionary charts have been prepared on the basis of McMath-Hulbert Observatory data and diagrams. These charts organize data relating to practically all calcium plages reported by the McMath-Hulbert Observatory to World Data Center A for Solar-Terrestrial Physics (Boulder) in the years 1964-1979.

22071 (AD-A—115870/8) Interferometric observations of solar flare precursors at 10.6 ghz. Final report oct 80-jan 82. Hurford, G.J.; Zirin, H. (California Inst. of Tech., Pasadena (USA)). Mar 1982. 44p. NTIS, PC A03/MF A01.

The purpose of this study was to examine a data base of interferometric solar microwave data in order to identify, evaluate and interpret preflare microwave signatures, with reference to their possible role for the short-term prediction of solar flares. The data base used was acquired by the Owens Valley solar interferometer at 10.6 GHz between February 19, 1980 and March 31, 1981. Twenty-seven major flares which occurred between February 19 and August 31, 1980 and for which good quality interferometric data were available, were selected using optical, soft x-ray OR microwave flux criteria. These events were analysed in detail; very similar preflare signatures noted in four (15%) of the cases. Other unusual preflare behavior was noted in four additional cases. The most common signature was a step-like increase in signal amplitude, accompanied by a decrease or reversal in the degree of polarization. Physically, this precursive signature may be identified with the onset phase of solar flares, when slow heating in the metastable magnetic loops destabilize the system, leading to rapid energy release in the impulsive phase. The reason for the distinctive polarization signature is not understood at present, but may be related to the site of the heating within the magnetic loops.

22072 (AD-A—118170/0) Annotated atlas of h-alpha synoptic charts. McIntosh, P.S. (Johns Hopkins Univ., Silver Spring, MD (USA). Applied Physics Lab.). Jul 1982. 337p. NTIS, PC A15/MF A01.

This volume presents a record of large-scale solar magnetic fields and solar activity during 130 solar rotations, from November 1964 through July 1974, in the form of H-alpha synoptic charts and accompanying descriptive notes. A new perspective on large-scale magnetic fields is provided by the inference of lines of polarity reversal from the systems of structures visible in H-alpha patrol filtergrams. These structures map the neutral lines in the radial component of solar magnetic fields (McIntosh, 1972a), thereby revealing details of the boundaries to large-scale magnetic fields that are not recorded in magnetograms sensitive to the longitudinal (line-of-sight) component of the fields. This atlas testifies that neutral lines are of themselves important physical features in solar activity. They are associated directly with systems of physical structures. They form continuous lines that often encircle the entire sun. They have lifetimes in excess of 2 years. The neutral-line patterns normally predate, and survive, the occurrence of important centers of sunspot and flare activity.

22073 (AD-A—120096/3) Computer simulation of kinetic properties of plasmas. Final report. Denavit, J. (Northwestern Univ., Evanston, IL (USA). Dept. of Mechanical and Nuclear Engineering). Aug 1982. 18p. NTIS, PC A02/MF A01.

The research was directed toward the development and testing of new numerical methods for particle and hybrid simulation of plasmas, and their application to physical problems of current significance in space physics and in energetic charged-particles systems. This project will terminate on August 31, 1982 and this Final Report describes (I) the research accomplished since the last renewal on April 1, 1981, and (II) a perspective of the work done since the beginning of the project in February 1972.

22074 (ESA-SP—164) Solar system and its exploration. Burke, W.R. (European Space Agency, 75 - Paris (France)). Nov 1981. 272p. NTIS, PC A12/MF A01.

REFS Proc. of Alpbach Summer School Conf., Austria, 29 Jul. - 7 Aug. 1981 sponsored by ESA, CNES and DFVLR Original contains color illustrations.

The origin and evolution of the solar system were discussed. The interaction of the solar wind with the planetary magnetospheres, the boundary conditions and the planetary environments were considered. Planetary atmospheres and Moons were dealt with. Comets, and the technical aspects of space missions were covered. For individual titles, see N82-26088 through N82-26115.

22075 (ESA-SP—1042) Report on the activities of space science department in 1980-1981. Page, D.E.; Fitton, B.; Pedersen, A.; Taylor, B.G.; Wenzel, K.P.; Guyenne, T.D.; Swallow, E.; Levy, G. (European Space Agency, 75 - Paris (France)). Feb 1982. 82p. NTIS, PC A05/MF A01.

REFS Original contains color illustrations.

Cosmic rays, plasma physics, astronomy and high energy astrophysics were studied. Solar and interplanetary proton propagation and acceleration are considered. An experiment for measuring charge spectra of ultraheavy, cosmic ray nuclei is described. Electric field data from ISEE 1 and GEOS 2 were analyzed. Atomic and ionic IR fine structure lines emitted by gaseous nebulae were also studied. The southern galactic plane in the CO(2-1) transition at 1.3 mm wavelength was surveyed. Data from the COS B spark chamber gamma-ray astronomy telescope were analyzed.

22076 (INPE—2251-PRE/034) **Time delays in solar bursts measured in the mm-cm range of wavelengths.** Kaufmann, P.; Costa, J.E.R.; Strauss, F.M. (Instituto de Pesquisas Espaciais, Sao Jose dos Campos (Brazil)). Oct 1981. 36p. NTIS, PC A03/MF A01.

Submitted for publication. Sponsored in part by FINEP and FAPESP.

Various solar bursts were analysed with high sensitivity (0.03 s.f.u., r.m.s.) and high time resolution (1 ms) at two frequencies in the millimeter wave range (22 GHz and 44 GHz) and with moderate time resolution (100 ms) by a patrol telescope at a frequency in the microwave range (7 GHz). It was found that in most cases burst maximum emission is not coincident in time at those frequencies. Preceding maximum emission can be either at the higher or at the lower frequency. Time delays ranged from about 3 sec to near coincidence, defined within 10 ms. Some complex bursts presented all kinds of delays among different time structures, and sometime nearly uncorrelated time structures. Directional particle accelerations in complex magnetic configurations could be considered to explain the variety of the dynamic effects. Fastest burst rise times observed of 10ms at 44GHz and 40 ms at 22 GHz, might be associated to limiting formation times of emission sources combined to various absorption mechanisms at the source and surrounding plasma.

22077 (LA-UR—83-326) **Energy balance and photochemical processes in the inner coma.** Huebner, W.F.; Keady, J.J. (Max-Planck-Institut fuer Physik und Astrophysik, Garching (Germany, F.R.). Inst. fuer Astrophysik; Los Alamos National Lab., NM (USA)). 1982. Contract W-7405-ENG-36. 20p. (CONF-821171—1). NTIS, PC A02/MF A01. Order Number DE83007544.

From Hungarian Academy of Sciences meeting; Budapest, Hungary (1 Nov 1982).

Energy balance and multifluid flow in the coma are described. Expansion cooling, radiative cooling, photodissociative heating, chemical heating, and relative multifluid flow are the processes determining the energy budget. In the fluid dynamics, fast atomic and molecular hydrogen are considered as separate fluids with larger collision mean free paths than the cold bulk fluid that has a larger mean molecular weight. The transition from fluid flow to free molecular flow is approximated. The model predicts hydrogen and bulk fluid flow velocities in general agreement with observations. The effects of the temperature profile and the fast hydrogen flow on the chemistry in the inner coma are investigated. Results from a model approximating conditions in Halley's comet are presented.

22078 (LA-UR—83-348) **Plasma properties of driver gas following interplanetary shocks observed by ISEE-3.** Zwickl, R.D.; Asbridge, J.R.; Bame, S.J.; Feldman, W.C.; Gosling, J.T.; Smith, E.J. (Los Alamos National Lab., NM (USA); Jet Propulsion Lab., Pasadena, CA (USA)). 1982. Contract W-7405-ENG-36. 14p. (CONF-821159—4). NTIS, PC A02/MF A01. Order Number DE83007547.

From 5. solar wind conference; Woodstock, VT, USA (1 Nov 1982).

Plasma fluid parameters calculated from solar wind and magnetic field data obtained on ISEE 3 were studied to determine the characteristic properties of driver gas following interplanetary shocks. Of 54 shocks observed from August 1978 to February 1980, 9 contained a well defined driver gas that was clearly identifiable by a discontinuous decrease in the average proton temperature across a tangential discontinuity. While helium enhancements were present in all of 9 of these events, only about half of them contained simultaneous changes in the two quantities. Often the He/H ratio changed over a period of minutes. Simultaneous with the drop in proton temperature the helium and electron temperature decreased abruptly. In some cases the proton temperature depression was accompanied by a moderate increase in magnetic field magnitude with an unusually low variance and by an increase in the ratio of parallel to perpendicular temperature. The drive gas usually displayed a bi-directional flow of suprathermal solar wind electrons at higher energies (>137 eV).

22079 (MPI-PAE/EXTRATERR—169) **Observations of fast, transient gamma ray phenomena.** Kouveliotou, C. (Max-Planck-Institut fuer Physik und Astrophysik, Garching (Germany, F.R.). Inst. fuer Extraterrestrische Physik). Sep 1981. 207p. NTIS, PC A10/MF A01.

The International Sun/Earth Explorer 3 (ISEE) 3 gamma-ray burst (GRB) data are analyzed for cosmic and solar events. The ISEE 3 data are compared to an inter and an extragalactic source model. The satellite data agree best with the galactic model of thermonuclear runaway initiated by carbon detonation after the accretion of matter onto a neutron star. A GRB classification based on time structure similarities is proposed: spikes, singles, doubles, and multiples. Three of the solar GRB's come from the same flaring region and have high cross correlation coefficients. This suggests that the flare phenomenon is not catastrophic for the magnetic field configurations involved. The increasing temperature in the region of trapped plasma after the electron injection causes shrinking at the rising flank of the event as event absolute maximum approaches. For homologous events, a 1 day recharging period is indicated. Events either have decay times faster than 10 sec or slower than 20 sec. No such trend is seen in rise times. (ESA)

22080 (N—82-18246) **Isotopic stack - measurement of heavy cosmic ray isotopes.** Beaujean, R. (Kiel Univ. (Germany, F.R.)). Nov 1981. 3p. NTIS, PC A08/MF A01.

In NASA. Marshall Space Flight Center Spacelab Mission 1 Expt. Descriptions 3 p (SEE N82-18234 09-12).

Heavy cosmic ray nuclei with nuclear charge, Z, equal to or greater than 3 are to be measured using an isotopic stack consisting of passive visual track detectors which remain sensitive throughout the entire mission. The scientific data are stored in latent tracks which are produced by heavy ions and which can be revealed in the investigator's laboratory after recovery. During the mission, only housekeeping data have to be collected. The exposure onboard Spacelab 1 allows the study of the chemical composition and energy spectrum of particles which have energies in the range 20 to 100 million electron volts per atomic mass unit, as well as the isotopic composition of heavy galactic cosmic rays with energies in the range 100 to 1000 million electron volts per atomic mass unit.

22081 (N—82-18251) **Spectroscopy in x-ray astronomy.** Andresen, R. (European Space Technology Center, Delft (Netherlands)). Nov 1981. 3p. NTIS, PC A08/MF A01.

In NASA. Marshall Space Flight Center Spacelab Mission 1 Expt. Descriptions 3 p (SEE N82-18234 09-12).

Detailed features in cosmic X-ray sources and their associated temporal variation over a wide energy range were studied. Excess emission and absorption at approximately 6 to 7 kiloelectron volts in the spectra of supernova remnants, binary X-ray sources, and clusters of galaxies were observed. A gas scintillation proportional counter (GSPC) will be used as the detector system. In the gas scintillator the principal limitation is due to the statistics of the initial ionization process only.

22082 (N—82-18253) **Measurement of the solar constant.** Crommelynck, D. (Institut Royal Meteorologique de Belgique, Brussels). Nov 1981. 3p. NTIS, PC A08/MF A01.

In NASA. Marshall Space Flight Center Spacelab Mission 1 Expt. Descriptions 3 p (SEE N82-18234 09-12).

The absolute value of the solar constant and the long term variations that exist in the absolute value of the solar constant were measured. The solar constant is the total irradiance of the Sun at a distance of one astronomical unit. An absolute radiometer removed from the effects of the atmosphere with its calibration tested in situ was used to measure the solar constant. The importance of an accurate knowledge of the solar constant is emphasized.

22083 (N—82-18254) **Solar spectrum from 170 to 3200 nanometers.** Thuillier, G. (Centre National de la Recherche Scientifique, 75 - Paris (France)). Nov 1981. 3p. NTIS, PC A08/MF A01.

In NASA. Marshall Space Flight Center Spacelab Mission 1 Expt. Descriptions 3 p (SEE N82-18234 09-12).

The spectral irradiance of the Sun between 170 and 3200 nanometers was measured to determine accurately the solar constant, its possible variation with the solar cycle, and the wavelength range responsible for the observed variations. It is pointed out that measurements over very long time periods (10 years) involving flights of the same instrument on future Spacelab missions will be required. Few spectral solar irradiation measurements ranging from the near ultraviolet to the near infrared have been performed yet. The most extensive solar irradiation measurements were obtained by a spectrometer onboard an aircraft or from high altitude observatories. The full disk irradiation flux was measured, corrections for atmospheric absorption are applied in all of the measurements.

22084 (N—82-21120) **Gamma ray observations of the solar system.** (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). 1981. 6p. NTIS (US Sales Only).

Two general categories are discussed concerning the evolution of the solar system: the dualistic view, the planetesimal approach and the monistic view, the nebular hypothesis. The major points of each view are given and the models that are developed from these views are described. Possible applications of gamma ray astronomical observations to the question of the dynamic evolution of the solar system are discussed.

22085 (N—82-21122) **Solar observations.** (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). 1981. 28p. NTIS (US Sales Only).

High energy processes that take place in the Sun's atmosphere and the relationship of these phenomena to the basic problems of solar activity are discussed. Gamma ray emission exhibits characteristics of the conditions in regions where accelerated high energy particles interact. A number of gamma ray production mechanisms are considered. These include: the Compton effect, magnetobremsstrahlung, pi meson production by proton-proton interaction or by proton-antiproton annihilation, fission and neutral of charged particle radiative capture on inelastic scatter.

22086 (N—82-21123) **The interstellar medium and galactic structure.** (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). 1981. 32p. NTIS (US Sales Only).

High energy gamma rays are produced by the interaction of cosmic rays with the interstellar matter in the galaxy. By combining the gamma ray information with radio data, a picture of the galaxy is presented with regard to the general structure and the effects of cosmic ray pressure. The interaction processes and galactic matter distribution are discussed. Galactic cosmic ray distribution and current gamma ray results are reported.

22087 (N—82-21124) **Compact objects.** (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). 1981. 29p. NTIS PC$10.00/MF A01.

Various types of objects and phenomena and their significance in high energy astrophysics are discussed. The current concepts of the nature of the objects and the mechanisms generating high energy electromagnetic radiation are also discussed. Current observational data is presented. Objects of special interest include black holes, supernova remnants, neutron stars, and pulsars.

22088 (N—82-21125) **Galaxies.** (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). 1981. 21p. NTIS (US Sales Only).

Normal galaxies, radio galaxies, and Seyfert galaxies are considered. The large magellanic cloud and the great galaxy in Andromedia are highlighted. Quasars and BL lacertae objects are also discussed and a review of the spectral observations of all of these galaxies and celestial objects is presented.

22089 (N—82-21126) **Cosmology.** (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). 1981. 15p. NTIS PC$10.00/MF A01.

The current view of the universe is summarized. The equations used to described it and the means of interpreting the diffuse gamma radiation which might result from phenomena which occurred in the distant past are described. The Friedmann model is described in detail.

22090 (N—82-21127) **Diffuse radiation.** (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). 1981. 21p. NTIS, PC A01.

A diffuse celestial radiation which is isotropic at least on a course scale were measured from the soft X-ray region to about 150 MeV, at which energy the intensity falls below that of the galactic emission for most galactic latitudes. The spectral shape, the intensity, and the established degree of isotropy of this diffuse radiation already place severe constraints on the possible explanations for this radiation. Among the extragalactic theories, the more promising explanations of the isotropic diffuse emission appear to be radiation from exceptional galaxies from matter antimatter annihilation at the boundaries of superclusters of galaxies of matter and antimatter in baryon symmetric big bang models. Other possible sources for extragalactic diffuse gamma radiation are discussed and include normal galaxies, clusters of galaxies, primordial cosmic rays interacting with intergalactic matter, primordial black holes, and cosmic ray leakage from galaxies.

22091 (N—82-21128) **Gamma ray interaction processes.** (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). 1981. 18p. NTIS PC$10.00/MF A01.

Gamma ray detection in the energy region above 1 keV involves measurements of the energy exchange or energy loss between the gamma ray and the mass of the detector. In most cases of interest, it is the kinetic energy imparted to charged particles by the gamma ray which is lost in the detector and measured in order to obtain spectral knowledge between the incident gamma ray photon and the direction of the secondary particles contains important energy information. The interaction gamma ray removal processes in matter are considered. This interaction removal process is characterized by the fact that each gamma ray is removed individually from the incident beam. The number of photons removed in this manner is proportional to the thickness of matter traversed.

22092 (N—82-21129) **Detectors for energies less than 10 MeV.** (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). 1981. 57p. NTIS (US Sales Only).

In the energy domain 100 keV to 10 MeV, both crystal scintillations and semiconductors are widely used for gamma ray detectors in spectrometer systems. These detectors' operation depend on the fact that gamma rays lose energy by ionization in these materials and electrons and holes are produced. In the case of semiconductors, these electrons and holes are collected by an electric field, and they provide an electric signal that is a direct measure of the energy lost by the gamma ray in the material. Scintillation detectors depend on a further conversion of the energy lost in electron hole pair production to the production of photons. A photomultiplier tube measures the intensity of the photon flux, and an electrical pulse proportional to the photon intensity is produced at the photomultiplier output.

22093 (N—82-21130) **Detectors for energies greater than 10 MeV.** (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). 1981. 32p. NTIS (US Sales Only).

The detector telescopes used in gamma ray astronomy in general are more similar to particle detectors than to optical devices, since the high frequency of the radiation precludes the use of reflection or diffraction techniques, but the high energy content of each photon does enable them to be detected with scintillators, track imaging chambers, and solid state detectors. Within the gamma ray range, the basic design of the instrument changes as the energy of the gamma ray exceeds 10 to 20 MeV, and therefore, moves from the region where the Compton effect predominates in the absorption of the gamma ray to that where electron pair production is most important. In the energy range from 10 to 20 MeV to several times 10,000 MeV, gamma ray telescopes are usually built so that the electron pair may be seen and the properties of the electrons measured.

22094 **(N—82-21131) Analysis of observational spectra.** (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). 1981. 46p. NTIS PC$10.00/MF A01.

The first step in the analysis of gamma ray energy loss spectra is their conversion to differential energy and differential angular photon spectra. This conversion can be carried out if the detector response and the background are both known. Once these parameters are known, there are many techniques that can be used to convert pulse height spectra to photon spectra. These techniques are discussed and background problems are considered. Emphasis is placed on the analysis of energy loss spectra in the lower gamma ray energy domain. Problems of transportations from pulse height to photon space are most complex in this domain and the methods shown illustrate many of the problems which arise in the general analysis of energy loss spectra.

22095 **(N—82-22115) Isolated grain condensation behavior: computation methods and first results. Final report.** Lewis, J.S. (Lewis (John S.) Associates, Inc., Natick, MA (USA)). Feb 1982. 12p. NTIS, PC A03/MF A01.

A set of efficient programs for calculation of condensation behavior in a system with either solar or carbon-rich elemental composition was developed to treat the course of condensation at very low pressures. These programs were applied to the problem of condensation at very low pressures. The minerals produced in the stellar and nova-related processes under study, including carriers of important volatile elements such as carbon and nitrogen, are candidates for accretion into meteorite parent bodies and planets, and may still be discernible in the enstatite chondrites.

22096 **(N—82-25031) Observations of b-type supergiants.** (National Aeronautics and Space Administration, Washington, DC (USA)). 1982. 68p. NTIS, PC A23/MF A01.

In its B Stars With and Without Emission Lines, Parts 1 and 2 p 79-146 (SEE N82-25027 15-88).

Methods are presented for determining the effective temperatures, radii and bolometric corrections for B-type supergiants. Absorption lines from hydrogen and from other elements, the H alpha, Balmer progression, and evidence for outflow from the invisible spectrum of these supergiants are considered. Luminosity effects, outflow velocities, and variability in the UV spectrum at high resolution are examined as well as the infrared and radio spectra. Spectroscopic characteristics of the peculiar supergiant P Cyg and superluminous supergiants, X-ray binaries, the properties of the photosphere and mantle and mass loss are elaborated. A general model for the mantle of B stars is included and the properties of B type stars in the main sequence are compared with those of the B-type supergiants.

22097 **(N—82-25037) Data obtained from spacecraft.** (National Aeronautics and Space Administration, Washington, DC (USA)). 1982. 33p. NTIS, PC A23/MF A01.

In its B Stars With and Without Emission Lines, Parts 1 and 2 p 375-407 (SEE N82-25027 15-88).

Data from spacecraft observations of B stars in the ultraviolet and X-ray spectral regions are presented. Superionization, mass flux, and the extended envelope are discussed in reference to ultraviolet line spectral. The problem of determining the ultraviolet flux of the B stars is examined. Spectral variations of gamma Cas and 59 Cyg are also discussed.

22098 **(N—82-25059) Infrared absorption by OH containing compounds.** Hillman, J.J. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Apr 1982. 15p. NTIS, PC A18/MF A01.

In its Vibrational-Rotational Spectry. for Planetary Atmospheres, Vol. 1 p 295-310 (SEE N82-25043 15-91) REFS.

The spectroscopy of the species H_2O, H_2O_2, and HO_2 are discussed. Their vibration rotation transitions are emphasized, but the pure rotational transitions in the vibrational ground state of H_2O are also considered since they contribute to opacity in the middle infrared region.

22099 **(N—82-25060) Infrared absorption of sulfur bearing compounds.** Maki, A. (National Bureau of Standards, Washington, DC (USA)). Apr 1982. 20p. NTIS, PC A18/MF A01.

In NASA. Goddard Space Flight Center Vibrational-Rotational Spectry. for Planetary Atmospheres, Vol. 1 p 311-330 (SEE N82-25043 15-91) REFS.

The sulfur bearing molecules of most interest in studies of planetary atmospheres are the simple, stable hydrides and oxides, H_2S, H_2SO_4, SO_2, and SO_3, and the carbon containing species OCS and CO_2. For interpreting spectroscopic observations, the properties that must be known are: transition frequencies, transition intensities, transition assignments in terms of quantum number assignments and lower state energy levels, and pressure broadening constants (including their temperature dependence).

22100 **(N—82-25077) Why solar flares are studied.** Mangeney, A. (Observatoire de Paris, Section de Meudon, 92 (France)). 1981. 4p. (French). NTIS, PC A07/MF A01.

In its Forum on Solar Activity 4 p (SEE N82-25076 15-92).

Solar flare phenomena of interest in astrophysics and plasma physics are discussed. The situation is considered where a dense region (solar envelope) whose motion is controlled by essentially nonmagnetic processes, e.g., convective instabilities, tranfers nonradiative energy to a tenuous region (solar atmosphere) whose motion, on the contrary, is controlled by the magnetic field. A dimensional analysis of the equation of motion is shown in terms of the beta parameter. A force-free magnetic field in the atmosphere is arrived at. Evaluation of force-free equilibria gives the potential field. Motion in the envelope incessantly modifies the magnetic field configuration, while free energy is stored in the atmosphere. Unanswered questions as to the characterization of the dissipation of this energy are evoked.

22101 **(N—82-25078) Flares and dynamic aspects.** Hanssen, E.T. (National Aeronautics and Space Administration, Huntsville, AL (USA). George C. Marshall Space Flight Center). 1981. 13p. (French). NTIS, PC A07/MF A01.

In Obs. de Paris-Meudon Forum on Solar Activity 13 p (SEE N82-25076 15-92) REFS.

Theory of the dynamic nature of solar flares, eruptive prominences, and coronal transients is surveyed. Two types of flare are considered: compact eruptions (small flares) which are probably loops, and large eruptions of double filament flares. The physical sense of this classification is justified, using solar observations. Even leaving the question unanswered of whether a coronal transient is a loop of ejected matter or a shock wave, the important, perhaps fundamental, role of mass motion in flare physics is evidenced.

22102 **(N—82-25079) Spectroscopic diagnostics of solar flares.** Bely-Dubau, F. (Observatoire de Paris-Meudon); Dubau, J. (Observatoire de Paris-Meudon); Faucher, P. (Observatoire de Nice, 06 (France)). 1981. 14p. (French). NTIS, PC A07/MF A01.

In Obs. de Paris-Meudon Forum on Solar Activity 14 p (SEE N82-25076 15-92) REFS.

Observations made with the X-ray polychromator (XRP) on board the Solar Maximum Mission satellite were analyzed. Data from the bent crystal spectrometer portion of the XRP experiment, in the spectral domain 1 to 3 A, with high spectral and temporal resolution, were used. Results for the spectrum analysis of iron are given. The possibility of polarization effects is considered. Although it is demonstrated that hyperfine analyses of a given spectrum are obtainable, provided calculations include large quantities of high precision atomic data, the interpretation is limited by the hypothesis of homogeneity of the emitting plasma.

22103 **(N—82-25080) Determination of magnetic fields and anisotropies of a milieu from interpretation of the linear polarization of lines.** Sahal-Brechot, S. (Observatoire de Paris, Section de Meudon, 92 (France)). 1981. 28p. (French). NTIS, PC A07/MF A01.

In Obs. de Paris-Meudon Forum on Solar Activity 28 p (SEE N82-25076 15-92) REFS.

Research in atomic physics was applied to polarimetric observations of solar prominences and flares. Attempts to measure both the magnetic field in magnitude and direction of the magnetic field as well as the velocity field are described. Two causes behind the global polarization of a line are explained: excitation by a directional ray, and directional collisions. Causes which can lead to a modification of this global polarization, particularly by a magnetic field (Hanle effect), are examined. While interpretation of the Hanle effect gives a measure of the magnetic field vector, analysis of the polarization of a line profile provides information on the velocity field vector, arriving at a simultaneous vector detection scheme.

22104 (N—82-25081) The sites of solar flares. Mein, P. (Observatoire de Paris, Section de Meudon, 92 (France)). 1981. 7p. (French). NTIS, PC A07/MF A01.

In Obs. de Paris-Meudon Forum on Solar Activity 7 p (SEE N82-25076 15-92) REFS.

Observations of solar flares were studied. Results on the magnetic field structure associated with an elementary flare are discussed. Conditions which prelude the triggering of instabilities (homologous flares, disappearance of filaments) are covered. The post-flare relaxation phase is also considered. Linear polarization of lines during flare events and the variable geometry of magnetic field lines (mass ejection dynamics) are treated. The importance of continuous observation over several hours in interpreting these events is shown.

22105 (N—82-25082) Particle acceleration in solar flares. Simnett, G.M. (Birmingham Univ. (UK)). 1981. 21p. NTIS, PC A07/MF A01.

In Obs. de Paris-Meudon Forum on Solar Activity 21 p (SEE N82-25076 15-92) REFS.

Some contemporary problems relating to the acceleration of charged particles in solar flares are discussed including the how, when, and where of the acceleration. Particular emphasis is given to electron acceleration since electrons are more easily detected via the radiation produced in their interaction with plasma, and magnetic fields. Acceleration in both the impulsive phase and in a shock induced second stage is outlined together with the controversy between thermal and nonthermal processes. Results of studies made during the last solar maximum are considered, together with more recently available spatially resolved radio data, and similar X-ray data from the Solar Maximum Mission. Proton acceleration in the impulsive phase is discussed in relation to the gamma radiation it stimulates. If the corona is an aceleration site, the manifestations of flares so well observed at the lower energies, (optical, EUV, soft X-ray) may well be truly secondary processes with the primary energy release site and particle acceleration region quite remote.

22106 (N—82-25083) Metric emissions in conjunction with solar activity. Lantos, P. (Observatoire de Paris, Section de Meudon, 92 (France)). 1981. 7p. (FRENCH). NTIS, PC A07/MF A01.

In Obs. de Paris-Meudon Forum on Solar Activity 7 p (SEE N82-25076 15-92) REFS.

The temporal sequence as well as localization of the acceleration and injection of electrons necessary for the emission of solar radio bursts are considered. Results obtained with the radioheliograph at Nancy are used along with observations from ISEE 3 and the Solar Maximum Mission. Coronal structures where bursts occur are identified. Parameters, such as evolution, magnetic field, and density, which can be studied by radio astronomy are discussed. Type 3 bursts are associated with the preeruptive and impulsive phases of a flare, while type 2 and 4 bursts go with a flare continuum. A noise storm accompanies the final phase.

22107 (N—82-25085) Recent developments in solar flare models. Heyvaerts, J. (Centre National de la Recherche Scientifique, 75 - Paris (France). Inst. d'Astrophysique). 1981. 21p. (In French). NTIS, PC A07/MF A01.

In Obs. de Paris-Meudon Forum on Solar Activity 21 p (SEE N82-25076 15-92) REFS Prepared in cooperation with Inst. d'Astrophysique, Paris.

Theoretical models which explain why and how solar flares occur are surveyed. Processes that govern the dissipation of magnetic energy are considered fundamental. The storage of magnetic energy and what produces its violent conversion into thermal and suprathermal energy are considered. A magnetic model of a flare which is presented comprises three phases: a stable flare buildup phase evolves into an impulsive phase which leads to the principle phase of a flare phenomenon. The stability of the preeruptive state and current sheets is discussed as well as the thermal equilibrium of the preeruptive structure. Reconnection in the preeruptive state and the occurence of spontaneous reconnection are treated. Results show that reconnection can have different geometries and, hence, can provoke nonlinear developments of widely varying magnitudes in the context of the solar corona.

22108 (N—82-26056) Coronae of nondegenerate single and binary stars: a survey of our present understanding and problems ripe for solution. Linsky, J.L. (Joint Inst. for Lab. Astrophysics, Boulder, CO (USA)). Nov 1981. 24p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 13-36 (SEE N82-26055 16-88) REFS.

Information about the coronae of stars in different portions of the HR diagram, and how the characteristics of such coronae compare with what is known about the solar corona are reviewed. For each type of star, some unanswered questions and the generic type of X-ray instrument required to answer these questions are listed. The survey points out the critical need for a sensitive X-ray instrument with both moderate spectra resolution and imaging capability that can monitor selected targets for long periods of time. There is also a need for high spectral resolution, provided sensitivities can be improved greatly over Einstein, and near simultaneous ultraviolet spectroscopy.

22109 (N—82-26057) Continuum and line spectra of degenerate dwarf x-ray sources. Lamb, D.Q. (Harvard Univ., Cambridge, MA (USA). Center for Astrophysics). Nov 1981. 40p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 37-67 (SEE N82-26055 16-88) REFS.

Recent observations of X-ray sources are summarized. Unresolved issues concerning these sources are discussed and an outline of the kinds of X-ray observations that would best advance the understanding of these sources is presented.

22110 (N—82-26058) Neutron star binaries, pulsars and burst sources. Lamb, F.K. (Illinois Univ., Urbana (USA)). Nov 1981. 30p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 77-106 (SEE N82-26055 16-88) REFS.

Unresolved issues involving neutron star binaries, pulsars, and burst sources are described. Attention is drawn to the types of observations most likely to resolve them. Many of these observations are likely to be carried out during the next decade by one or more missions that have been approved or proposed. Flux measurements with an imaging detector and broad-band spectroscopic studies in the energy range 30-150 keV are discussed. The need for soft X-ray and X-ray observations with an instrument which has arcminute angular resolution and an effective area substantially greater than of ROSAT or EXOSAT is also discussed.

22111 (N—82-26059) X-ray spectroscopic observations and modeling of supernova remnants. Shull, J.M. (Colorado Univ., Boulder (USA); Joint Inst. for Lab. Astrophysics, Boulder, CO (USA)). Nov 1981. 11p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 107-117 (SEE N82-26055 16-88) REFS Prepared in cooperation with the Joint Inst. for Lab. Astrophysics.

The X-ray observations of young remnants and their theoretical interpretation are described. A number of questions concerning the nature of the blast wave interaction with the interstellar gas and grains and of atomic processes in these hot plasmas are considered. It is concluded that future X-ray spectrometers with high collecting area, moderate spectral resolution and good spatial resolution can make important contributions to the understanding of supernova remnants in the Milky Way and neighboring galaxies and of their role in the global chemical and dynamical evolution of the interstellar medium.

22112 **(N—82-26060) Interstellar, intracluster and supercluster gas.** Cowie, L.L. (Massachusetts Inst. of Tech., Cambridge (USA)). Nov 1981. 14p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 119-132 (SEE N82-26055 16-88) REFS.

Hot tenuous plasmas with temperatures in the range 1,000,000 to 3.10 to the 8th power K and densities of .000001 to .001 per cu cm are considered. The dominant radiation processes are thermal bremstrahlung and collisional line excitation and all except the very hottest objects will have observable X-ray emissions lines. The most important unifying point is the angular scales involved. For the interstellar gas, structure ranging in size from about 10 ft to tens of degrees is expected.

22113 **(N—82-26062) X-rays from quasars and active galaxies.** Lightman, A.P. (Harvard Univ., Cambridge, MA (USA). Center for Astrophysics). Nov 1981. 40p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 143-182 (SEE N82-26055 16-88) REFS.

Features of quasars and active galactic nuclei are discussed and include: the nature of the power source, the radiation processes, and the mechanism for the formation and collimation of long-lived jets of matter observed to emanate from the center of these of these objects. The phenomena that produce X-rays are highlighted.

22114 **(N—82-26064) X-ray astronomy program in Japan.** Tanaka, Y. (Institute of Space and Astronautical Science, Tokyo (Japan)). Nov 1982. 8p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 219-226 (SEE N82-26055 16-88) REFS.

Hakucho satellite operations and the problems that emerged from the neutron star observations are illustrated. X-ray pulsars and bursters are reviewed. Future satellite programs are outlined.

22115 **(N—82-26065) LAMAR: a high throughput x-ray astronomy facility for a moderate cost mission.** Gorenstein, P.; Schwartz, D. (Harvard Univ., Cambridge, MA (USA). Center for Astrophysics). Nov 1981. 43p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 227-269 (SEE N82-26055 16-88) REFS.

The performance of a large area modular array of reflectors (LAMAR) is considered in several hypothetical observations relevant to: (1) cosmology, the X-ray background, and large scale structure of the universe (2) clusters of galaxies and their evolution (3) quasars and other active galactic nuclei (4) compact objects in our galaxy (5) stellar coronae and (6) energy input to the interstellar medium.

22116 **(N—82-26066) Wolter type i LAMAR.** Catura, R.C.; Joki, E.G. (Lockheed Missiles and Space Co., Palo Alto, CA (USA)). Nov 1981. 17p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 271-287 (SEE N82-26055 16-88) REFS.

Observational objectives for the LAMAR and their influence on the instrument design are discussed. It is concluded that the most important design parameter is the angular resolution of the LAMAR modules since it so strongly influences sensitivity, optical identifications, source confusion, spectral resolution for objective gratings and the ability to resolve small extended sources. A high resolution Wolter Type I LAMAR module is described, its hardware status discussed, and the performance of a LAMAR observatory presented. A promising technique for enhancing the reflectivity of Wolter Type I X-ray optics in a selected bandpass at high energy has been investigated and the performance of the LAMAR module, utilizing this method, has been calculated.

22117 **(N—82-26072) Hard x-ray imaging from explorer.** Grindlay, J.E.; Murray, S.S. (Harvard Univ., Cambridge, MA (USA). Center for Astrophysics). Nov 1981. 18p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 349-366 (SEE N82-26055 16-88) REFS.

Coded aperture X-ray detectors were applied to obtain large increases in sensitivity as well as angular resolution. A hard X-ray coded aperture detector concept is described which enables very high sensitivity studies persistent hard X-ray sources and gamma ray bursts. Coded aperture imaging is employed so that approx. 2 min source locations can be derived within a 3 deg field of view. Gamma bursts were located initially to within approx. 2 deg and X-ray/hard X-ray spectra and timing, as well as precise locations, derived for possible burst afterglow emission. It is suggested that hard X-ray imaging should be conducted from an Explorer mission where long exposure times are possible.

22118 **(N—82-26073) Stellar coronal x-ray explorer: STCOEX.** Vaiana, G.S. (Harvard Univ., Cambridge, MA (USA). Center for Astrophysics). Nov 1981. 7p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 371-377 (SEE N82-26055 16-88) REFS.

The status of the newly born field of stellar X-ray astronomy is considered. The need for further observational capability, the study of stellar surface activity and the development of design criteria for a follow-up mission, with primary emphasis on stellar observations and with general capabilities within the scope of the Explorer program are examined. The criteria which lead to the desired instrumental capabilities are reviewed and an overview of the proposed instrument and some of its capabilities, as indicated by simulations is presented. Two versions of a trial payload the stellar coronal. Explorer (STCOEX) which meet the observational desirable are developed.

22119 **(N—82-26077) Broad band x-ray telescope (BBXRT).** Serlemitsos, P.J. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Nov 1981. 20p. NTIS, PC A99/MF A01.

In its X-ray Astronomy in the 1980's p 441-460 (SEE N82-26055 16-88) REFS.

An approach along with corroborating measurements for significantly enhancing the potential of Si(Li) spectrophotometry in X-ray astronomy is presented. The key new element is an unconventional X-ray mirror that meets qualifications of low cost, light weight, and large throughput over a broad energy band at moderate angular resolution. The potential for other applications is also discussed.

22120 **(N—82-26078) Some observational tests of x-ray pulsar emission models.** Meszaros, P. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Nov 1981. 9p. NTIS, PC A99/MF A01.

In its X-ray Astronomy in the 1980's p 461-469 (SEE N82-26055 16-88) REFS.

The understanding of neutron star physics which relies heavily on knowing values of their mass, radius and magnetic field strength was studied. The only information about these till now comes from the surface radiation. Major uncertainties concerning the nature of the mass exchange and the accretion flow, the magnetopause structure, the infall deceleration, the actual pulsation mechanism and the atmosphere geometry are examined. The alternatives and several possible observational tests are discussed.

22121 **(N—82-26079) Observability of atomic line features in strong magnetic fields.** Wunner, G.; Ruder, H.; Herold, H.; Truemper, J. (Erlangen-Nuernberg Univ., Erlangen (Germany, F.R.)). Nov 1981. 6p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 471-476 (SEE N82-26055 16-88) REFS Sponsored in part by Deutsche Forschungsmeinschaft.

The physical properties of atoms in superstrong magnetic fields, characteristic of neutron stars, and the possibility of detecting magnetically strongly shifted atomic lines in the spectra of magnetized X-ray pulsars are discussed. It is suggested that it is recommendable to look for magnetically strongly shifted Fe 26 Lyman lines in rotating neutron stars of not too high luminosity using spectrometers working in the energy range 10 - 20 keV, with sensitivities to minus 4 power photons per sq cm and second, and resolution E/delta E approx. 10-100.

22122 (N—82-26080) A new method for focusing and imaging x-rays and gamma-rays with diffraction crystals. Smither, R.K. (Argonne National Lab., IL (USA)). Nov 1981. 19p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 477-495 (SEE N82-26055 16-88) REFS.

Bent diffraction crystals in which the intercrystalline-plane spacing is varied as a function of position in the crystal are used to focus monochromatic radiation from a point source or parallel beam down to a point image. Conversely, radiation from a point source can be focused into an outgoing parallel beam. The Bragg angle for diffraction of monochromatic radiation will now vary as a function of position in the crystal and this new degree of freedom is used to obtain focusing and imaging of the diffracted beam. This approach to focusing and imaging is applied to the design of a large-area, high resolution X-ray telescope that is also a high resolution monochromator with the unique feature that the width of the energy increment that is diffracted can be controlled and varied during the operation of the instrument. The field can be scanned with a wide energy increment and then switched to a narrow energy increment for the high resolution work. Both transmission and reflection type diffraction crystals can be used.

22123 (N—82-26084) Spectroscopy in the 10 kev to 10 mev range. Matteson, J.L. (California Univ., San Diego (USA)). Nov 1981. 18p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 549-566 (SEE N82-26055 16-88) REFS.

Spectral lines in the 10 keV to 1 MeV range carry information of fundamental importance on many astronomical objects. Since the lines are directly related to specific physical processes this information is model independent and gives the physical conditions in the objects. At the sensitivities achieved to date, approximately 0.0001 to 0.001 phsq cm. sec for steady sources and approximately 0.01 to 1 ph/sq cm sec for transient sources, lines were detected from the galactic center, gamma-ray bursts and transients, X-ray pulsators, the Crab pulsar and solar flares. Future instruments with a factor of approximately 100 sensitivity improvement will allow detailed spectroscopic study of these classes of objects as well as supernova remnants, active galaxies and the interstellar medium. This sensitivity improvement can be obtained through the use of detector technology already proven in balloon and satellite instruments.

22124 (N—82-26085) Spectroscopy from 2 to 200 kev. Helfand, D.J. (Sandia Lab., Albuquerque); Chanan, G.A. (Bell Telephone Labs.). (Columbia Univ., New York (USA)). Nov 1981. 32p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 567-598 (SEE N82-26055 16-88) REFS.

The astrophysical processes responsible for line and continuum emission in the spectra range 2 keV to 200 keV are examined from the viewpoint of designing a spectrometer which would operate in this regime. Phenomena considered include fluorescent line radiation in X-ray binaries, magnetically shifted iron lines and cyclotron emission from neutron star surfaces, line emission from cosmically abundant elements in thermal plasmas, and nuclear deexcitation lines in fresh nucleosynthetically produced matter. An instrument consisting of a approximately 10 sq cm array of planar germanium detectors surrounded by a large sodium-iodide anticoincidence shield is described and projected background rates and sensitivities are considered. A sample observing program for a two-day shuttle-based mission is included as an example of the wide range of scientific questions which could be addressed by such an instrument.

22125 (N—82-26086) Hard x-ray astrophysics. Rothschild, R.E. (California Univ., San Diego (USA)). Nov 1981. 21p. NTIS, PC A99/MF A01.

In NASA. Goddard Space Flight Center X-ray Astronomy in the 1980's p 599-620 (SEE N82-26055 16-88) REFS.

Past hard X-ray and lower energy satellite instruments are reviewed and it is shown that observation above 20 keV and up to hundreds of keV can provide much valuable information on the astrophysics of cosmic sources. To calculate possible sensitivities of future arrays, the efficiencies of a one-atmosphere inch gas counter (the HEAO-1 A-2 xenon filled HED3) and a 3 mm phoswich scintillator (the HEAO-1 A-4 NaI LED1) were compared. Above 15 keV, the scintillator was more efficient. In a similar comparison, the sensitivity of germanium detectors did not differ much from that of the scintillators, except at high energies where the sensitivity would remain flat and not rise with loss of efficiency. Questions to be addressed concerning the physics of active galaxies and the diffuse radiation background, black holes, radio pulsars, X-ray pulsars, and galactic clusters are examined.

22126 (N—82-26088) Plasma phase of the evolution of the solar system. Alfven, H. (Royal Inst. of Tech., Stockholm (Sweden)). Nov 1981. 8p. NTIS, PC A12/MF A01.

In ESA The Solar System and its Exploration p 3-10 (SEE N82-26087 16-88) REFS.

Magnetospheric research and laboratory evidence are used to argue that plasma dominated processes were essential for the evolution of interstellar clouds and of circumsolar cloud up to the transition from the plasma to the planetesimal phase. Interstellar clouds could be formed by electromagnetic contraction which would also increase cloud density, bringing it to the limit of gravitational collapse without recourse to a triggering mechanism. In a dusty plasma cloud, large particles serve as a core around which gaseous components can collapse. The inhomogeneity of the clouds causes them to fragment into stellesimals which accrete into protostars. Planets are formed in a semistationary process by matter from the primeval cloud penetrating a void around the protostar. Satellites are formed similarly. Chemically differentiated small clouds of neutral gas and dust reach the central body via a low plasma density region. The gas is stopped and ionized when it attains the critical velocity. This explains the band structure of the solar system.

22127 (N—82-26090) The sun as a star. Deinzer, W. (Universitaets-Sternwarte Goettingen, Germany (F.R.)). Nov 1981. 4p. NTIS, PC A12/MF A01.

In ESA The Solar System and its Exploration p 25-28 (SEE N82-26087 16-88) REFS.

The Sun and the theory of stellar structure, solar rotation, the solar cycle, and the solar magnetic field are discussed. The validity of solar models which adjust Prandtl's mixing length and helium abundance so that radius and luminosity match their solar values is tested. The fragmentary state of turbulence theory prevents investigation of the hydrogen convection zone from providing quantitative validation. Evidence based on solar neutrino flux and nonradial solar oscillations is not decisive. The transport of angular momentum towards the equator, resulting in differential rotation, could be due to anisotropic viscosity caused by turbulent eddies in the convection zone, Rossby waves, or convection. The pairwise appearance of sunspots and their migration towards lower latitudes are accounted for in numerical solutions of the modified induction equation. These show that strong toroidal flux tubes, of opposite sign in each half cycle, are produced.

22128 (N—82-26091) The solar atmosphere: from photosphere to corona. Jordan, C. (Oxford Univ. (UK)). Nov 1981. 11p. NTIS, PC A12/MF A01.

In ESA The Solar System and its Exploration p 29-39 (SEE N82-26087 16-88) REFS.

Developments in solar physics, emphasizing areas where observations from space contribute substantially, are reviewed. Progress in establishing the temperature and density structure of the outer solar layers is made through measurements of emission line fluxes in the extreme UV and X-ray wavelengths combined with spatial information from imaging instruments. The processes by which the corona and other hot plasma are heated remain elusive. Although the source of the heating is considered to be the interaction between gas motions and the magnetic fields in the subphotospheric convective zone, the means by which energy is transported and dissipated are unknown. Observations required to limit the range of possible mechanisms are discussed.

22129 (N—82-26093) The international solar polar mission (ISPM). Marsden, R.G.; Wenzel, K.P. (European Space Research and Technology Centre, Noordwijk (Netherlands)). Nov 1981. 9p. NTIS, PC A12/MF A01.

In ESA The Solar System and its Exploration p 51-59 (SEE N82-26087 16-88) REFS.

The instrumentation and mission objectives of ISPM are described. The ISPM explores the heliosphere within a few astronomical units of the Sun over the full range of heliographic latitudes. The prime mission objective is to study, as a function of solar latitude, the properties of the interplanetary medium and solar corona. It uses a Jupiter gravity-assist to achieve a high solar latitude trajectory. The scientific instrumentation is designed to explore, in the third heliospheric dimension, the properties of the solar corona, the solar wind, the Sun-wind interface, the heliospheric magnetic field, solar radio bursts and plasma waves, solar and galactic cosmic rays, and interplanetary/interstellar neutral dust and gas.

22130 **(N—82-26135) H_2 and HD spectroscopic status.** Margolis, J.S. (Jet Propulsion Lab., Pasadena, CA (USA)). Apr 1982. 7p. NTIS, PC A11/MF A01.

In NASA. Goddard Space Flight Center Vibrational-Rotational Spectry. for Planetary Atmospheres, Vol. 2 p 431-437 (SEE N82-26134 16-91) REFS.

HD spectra was studied in the UV about as thoroughly as those of H_2. The vibration-rotation line positions are known. However, the theory does not do well in calculating the absorption strengths. These tend to be stronger than the quadrupole strengths for H_2 and so more lines were measured. The state of knowledge of the HD line positions of vibration-rotation constants is summarized. The HD absorption strength measurements are also summarized. A summary of absorption strengths for HD is tabulated.

22131 **(N—82-26136) Collision induced sharp features in the infrared spectrum of HD.** Herman, R.M. (Pennsylvania State Univ., University Park (USA)). Apr 1982. 9p. NTIS, PC A11/MF A01.

In NASA. Goddard Space Flight Center Vibrational-Rotational Spectry. for Planetary Atmospheres, Vol. 2 p 439-447 (SEE N82-26134 16-91) REFS.

The collision induced spectra of HD and H_2 are studied. Their application to the study of planetary (and planetary satellite) atmospheres is investigated.

22132 **(N—82-26144) Current studies of CH_3D: ye olde line drive.** Lutz, B.L. (Lowell Observatory, Flagstaff, AZ (USA). Planetary Research Center). Apr 1982. 12p. NTIS, PC A11/MF A01.

In NASA. Goddard Space Flight Center Vibrational-Rotational Spectry. Planetary Atmospheres, Vol. 2 p 599-610 (SEE N82-26134 16-91) REFS.

The CH_3D molecule is an intermediate methane which has immediate importance in the study of the chemical composition of the outer planets. The deuterium present in the atmospheres of the giant planets is thought to be representative of the protosolar composition, a quantity of high interest to cosmogonists and to cosmologists. The values of D/H range from about .0002 in the interstellar medium to .00016 in sea water here on Earth. The CH_3D molecule was examined as a probe of the D/H ratio.

22133 **(NASA-CR—161985) Terrestrial cooling and solar variability. Final report.** Agee, E.M. (Universities Space Research Association, Boulder, CO (USA)). Feb 1982. 55p. NTIS, PC A04/MF A01.

Observational evidence from surface temperature records is presented and discussed which suggests a significant cooling trend over the Northern Hemisphere from 1940 to the present. This cooling trend is associated with an increase of the latitudinal gradient of temperature and the lapse rate, as predicted by climate models with decreased solar input and feedback mechanisms. Evidence suggests that four of these 80- to 100-year cycles of global surface temperature fluctuation may have occurred, and in succession, from 1600 to the present. Interpretation of sunspot activity were used to infer a direct thermal response of terrestrial temperature to solar variability on the time scale of the Gleissberg cycle (90 years, an amplitude of the 11-year cycles). A physical link between the sunspot activity and the solar parameter is hypothesized. Observations of sensible heat flux by stationary planetary waves and transient eddies, as well as general circulation modeling results of these processes, were examined from the viewpoint of the hypothesis of cooling due to reduced insolation.

22134 **(NASA-CR—165918) Definition study for an advanced cosmic ray experiment utilizing the long duration exposure facility. Final report, 17 July 1980-30 September 1981.** Price, P.B. (California Univ., Berkeley (USA)). Jun 1982. 56p. NTIS, PC A04/MF A01.

To achieve the goals of cosmic ray astrophysics, an ultraheavy cosmic ray experiment on an LDEF reflight should be in an orbit with high inclination (approximately 57 deg) at approximately 230 nm for approximately 2 years near solar minimum (approximately 1986). It should fill 61 trays. Each tray should contain 4 modules of total active area 0.7 sq m, with a thermal blanket, thermal labyrinth mounts, aluminum honeycomb mechanical support, and total weight approximately 100 kg. Each module should contain interleaved CR39, Lexan, and thin copper sheets plus one event-thermometer canned in a thin metal cannister sealed with approximately 0.2 atm dry O2. The CR39 and Lexan should be manufactured to specifications and the sheet copper rolled to specifications. The event-thermometer should be a stiffened CR39 sheet that slides via bimetal strips relative to fixed CR39 sheet so that stack temperature can be read out for each event. The metal cannister can be collapsed at launch and landing, capturing the sliding assembly to prevent damage. An engineering study should be made of a prototype LDEF tray this will include thermal and mechanical tests of detectors and the event thermometer.

22135 **(NASA-CR—166786) Solar diameter measurements for study of sun climate coupling. Final report, June 1980-May 1981.** Hill, H.A. (Arizona Univ., Tucson (USA)). Sep 1981. 11p. NTIS, PC A02/MF A01.

Variability in solar shape and diameters was examined as a possible probe of an important climatic driving function, solar luminosity variability. The techniques and facilities developed for measuring the solar diameter were used. The observing program and the requisite data reduction were conducted simultaneously. The development of a technique to calibrate the scale in the telescope field progressed to the design and construction phase.

22136 **(NASA-CR—168638) The differential emission measure of dynamic coronal loops.** Antiochos, S.K. (Stanford Univ., CA (USA)). Dec 1981. 10p. NTIS, PC A02/MF A01.

The effects of time dependent phenomena, such as flare energization and decay, on the temperature and density structure of the transition region and, in particular, on the form of the differential emission measure are studied. It is found that unlike the case of the static models, the form of the differential emission measure can be used to determine the important physical mechanisms in the dynamic models.

22137 **(NASA-CR—168703) Evolution of x-ray astronomy.** Rossj, B. (Massachusetts Inst. of Tech., Cambridge (USA)). 1981. 33p. NTIS, PC A03/MF A01.

REFS Presented at the Plasma Astrophys. Course and Workshop, Varenna, Italy, 27 Aug. - 7 Sep. 1981.

The evolution of X-ray astronomy up to the launching of the Einstein observatory is presented. The evaluation proceeded through the following major steps: (1) discovery of an extrasolar X-ray source, Sco X-1, orders of magnitude stronger than astronomers believed might exist (2) identification of a strong X-ray source with the Crab Nebula (3) identification of Sco X-1 with a faint, peculiar optical object (4) demonstration that X-ray stars are binary systems, each consisting of a collapsed object accreting matter from an ordinary star (5) discovery of X-ray bursts (6) discovery of exceedingly strong X-ray emission from active galaxies, quasars and clusters of galaxies (7) demonstration that the principal X-ray source is a hot gas filling the space between galaxies.

22138 **(NASA-CR—168911) Structure of the solar oscillation with period near 160 minutes.** Scherrer, P.H.; Wilcox, J.M. (Stanford Univ., CA (USA)). Feb 1982. 17p. NTIS, PC A02/MF A01.

REFS.

The solar oscillation with period near 160 minutes is found to be unique in a spectrum computed over the range of periods from about 71 to 278 minutes. A best estimate of the period is

160.0095 + or - 0.001 minutes, which is different from 160 minutes (one ninth of a day) by a highly significant amount. The width of the peak is approximately equal to the limiting resolution that can be obtained from an observation lasting 6 years, which suggests that the damping time of the oscillations is considerably longer than 6 years. A suggestion that this peak might be the result of a beating phenomenon between the five minute data averages and a solar oscillation with period near five minutes is shown to be incorrect by recomputing a portion of the spectrum using 15 second data averages.

22139 **(NASA-TM—82168) Complete x-ray sample of the high latitude sky from HEAO-1 A-2: log N log S and luminosity functions.** Piccinotti, G.; Mushotzky, R.F.; Boldt, E.A. Holt, S.S.; Marshall, F.E.; Serlemitsos, P.J.; Shafer, R.A. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Aug 1981. 51p. NTIS, PC A04/MF A01.

REFS Submitted for publication.

An experiment was performed in which a complete X-ray survey of the 8.2 steradians of the sky at galactic latitudes where the absolute value of b is 20 deg down to a limiting sensitivity of 3.1 x ten to the minus 11th power ergs/sq cm sec in the 2-10 keV band. Of the 85 detected sources 17 were identified with galactic objects, 61 were identified with extragalactic objects, and 7 remain unidentified. The log N - log S relation for the non-galactic objects is well fit by the Euclidean relationship. The X-ray spectra of these objects were used to construct log N - log S in physical units. The complete sample of identified sources was used to construct X-ray luminosity functions, using the absolute maximum likelihood method, for clusters galaxies and active galactic nuclei.

22140 **(NASA-TM—82465) Statistical aspects of the 1980 solar flares. 1: Data base, frequency distributions, and overview remarks.** Wilson, R.M. (National Aeronautics and Space Administration, Huntsville, AL (USA). George C. Marshall Space Flight Center). Jan 1982. 109p. NTIS, PC A06/MF A01.

All1349 H alpha flares occurring in 1980 which have known start, maximum brightness, and end times, latitudes, and associated importance and X-ray classes were used to perform a statistical study of flare rise time, decay time, duration, latitude, importance (areal and relative intensity), and X-ray class. Frequency distributions of these parameters are tabulated and plotted.

22141 **(NASA-TM—82474) Sunspot variation and selected associated phenomena: a look at solar cycle 21 and beyond.** Wilson, R.M. (National Aeronautics and Space Administration, Huntsville, AL (USA). George C. Marshall Space Flight Center). Feb 1982. 38p. NTIS, PC A03/MF A01.

REFS.

Solar sunspot cycles 8 through 21 are reviewed. Mean time intervals are calculated for maximum to maximum, minimum to minimum, minimum to maximum, and maximum to minimum phases for cycles 8 through 20 and 8 through 21. Simple cosine functions with a period of 132 years are compared to, and found to be representative of, the variation of smoothed sunspot numbers at solar maximum and minimum. A comparison of cycles 20 and 21 is given, leading to a projection for activity levels during the Spacelab 2 era (tentatively, November 1984). A prediction is made for cycle 22. Major flares are observed to peak several months subsequent to the solar maximum during cycle 21 and to be at minimum level several months after the solar minimum. Additional remarks are given for flares, gradual rise and fall radio events and 2800 MHz radio emission. Certain solar activity parameters, especially as they relate to the near term Spacelab 2 time frame are estimated.

22142 **(NASA-TM—82475) Statistical aspects of the 1980 solar flares. 2: solar cycle activity relationships and additional remarks.** Wilson, R.M. (National Aeronautics and Space Administration, Huntsville, AL (USA). George C. Marshall Space Flight Center). Feb 1982. 55p. NTIS, PC A04/MF A01.

REFS.

Based on 1349 hydrogen alpha flares with X-ray counterparts, an investigation into the relationship between the rise time, decay time, duration, latitude, hydrogen alpha importance, and X-ray class with 2800 MHz radio emission (F2800) was accomplished. An important finding is that during 1980 both the number of hydrogen alpha importance class 1 and number of X-ray class M (and M+X) flares appeared to be rather strongly related to F2800, in a positive sense i.e., number of class 1 and class M events increased as F2800 increased.

22143 **(NASA-TM—83816) Goddard contributions to the workshop on gamma ray transients.** (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Aug 1981. 84p. NTIS, PC A05/MF A01.

Six articles addressing cosmic and solar gamma ray transients are presented. The topics covered include: gamma ray lines from solar flares and cosmic transients including burst spectra; a review of the 1979 March 5 transient; time variation in the 511 KeV flux observed by the ISEE spectrometer; time variations of an absorption feature in the spectrum of the burst on 1980 April 19; and the theory of gamma ray amplification through stimulated annihilation radiation.

22144 **(NASA-TM—83840) Accretion disk coronae.** White, N.E.; Holt, S.S. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Oct 1981. 60p. NTIS, PC A04/MF A01.

Submitted for publication.

Recent observations of partial X-ray eclipses from 4U1822-37 have shown that the central X-ray source in this system is diffused by a large Compton-thick accretion disk corona (ADC). Another binary, 4U2129-47, also displays a partial eclipse and contains an ADC. The possible origin of an ADC is discussed and a simple hydrostatic evaporated ADC model is developed which, when applied to 4U1822-37, 4U2129+47 and Cyg X-3, can explain their temporal and spectral properties. The quasi-sinusoidal modulation of all three sources can be reconciled with the partial occultation of the ADC by a bulge at the edge of the accretion disk which is caused by the inflowing material. The height of this bulge is an order of magnitude larger than the hydrostatic disk height and is the result of turbulence in the outer region of the disk. The spectral properties of all three sources can be understood in terms of Compton scattering of the original source spectrum by the ADC. Spectral variations with epoch in Cyg X-3 are probably caused by changes in the optical depth of the corona. A consequence of our model is that any accreting neutron star X-ray source in a semi-detached binary system which is close to its Eddington limit most likely contains an optically thick ADC.

22145 **(NASA-TM—83841) Planetary magnetospheres.** Stern, D.P.; Ness, N.F. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Oct 1981. 45p. NTIS, PC A03/MF A01.

Submitted for publication.

A concise overview is presented of our understanding of planetary magnetospheres (and in particular, of that of the Earth), as of the end of 1981. Emphasis is placed on processes of astrophysical interest, e.g., on particle acceleration, collision-free shocks, particle motion, parallel electric fields, magnetic merging, substorms, and large scale plasma flows. The general morphology and topology of the Earth's magnetosphere are discussed, and important results are given about the magnetospheres of Jupiter, Saturn and Mercury, including those derived from the Voyager 1 and 2 missions and those related to Jupiter's satellite Io. About 160 references are cited, including many reviews from which additional details can be obtained.

22146 **(NASA-TM—83870) Neutral hydrogen in elliptical galaxies with nuclear radio sources and optical emission lines.** Dressel, L.L.; Bania, T.M.; Oconnell, R.W. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Jan 1982. 44p. NTIS, PC A03/MF A01.

An H I detection survey of eleven elliptical galaxies with powerful nuclear radio sources was conducted, using the 305 m antenna of Arecibo Observatory, to test the hypothesis that large H I mass is conductive to the formation of nuclear radio sources in elliptical galaxies. The H I was detected in emission in UGC 09114 and was possibly detected in absorption in UGC 06671. Observations of the remaining galaxies were not sensitive enough to support or refute the hypothesis. Data was combined from other H I surveys and spectroscopic surveys to search for correlations of H I mass with other galactic properties and environmental conditions. Strong correlations of (O II) lambda 3727 emission with H I content and with nuclear radio power were found. The latter two properties may simply indicate, respectively, whether a significant amount of gas is available to be ionized and whether energy is provided by nuclear activity for ionization. No dependence of H I content on optical luminosity or on degree of isolation from other galaxies was found.

22147 (NASA-TM—83873) **Astrophysical tests for radiative decay of neutrinos and fundamental physics implications.** Stecker, F.W.; Brown, R.W. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Dec 1981. 31p. NTIS, PC A03/MF A01.

Submitted for publication.

The radiative lifetime tau for the decay of massious neutrinos was calculated using various physical models for neutrino decay. The results were then related to the astrophysical problem of the detectability of the decay photons from cosmic neutrinos. Conversely, the astrophysical data were used to place lower limits on tau. These limits are all well below predicted values. However, an observed feature at approximately 1700 A in the ultraviolet background radiation at high galactic latitudes may be from the decay of neutrinos with mass approximately 14 eV. This would require a decay rate much larger than the predictions of standard models but could be indicative of a decay rate possible in composite models or other new physics. Thus an important test for substructure in leptons and quarks or other physics beyond the standard electroweak model may have been found.

22148 (NASA-TM—83883) **Experimental and theoretical studies of interstellar grains.** Nuth, J.A. III. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Dec 1981. 260p. NTIS, PC A12/MF A01.

Steady state vibrational populations of SiO and CO in dilute black body radiation fields were calculated as a function of total pressure, kinetic temperature and chemical composition of the gas. Approximate calculations for polyatomic molecules are presented. Vibrational disequilibrium becomes increasingly significant as total pressure and radiation density decrease. Many regions of postulated grain formation are found to be far from thermal equilibrium before the onset of nucleation. Calculations based upon classical nucleation theory or equilibrium thermodynamics are expected to be of dubious value in such regions. Laboratory measurements of the extinction of small iron and magnetite grains were made from 195 nm to 830 nm and found to be consistent with predictions based upon published optical constants. This implies that small iron particles are not responsible for the 220 nm interstellar extinction features. Additional measurements are discussed.

22149 (NASA-TM—83884) **Precise source location of the anomalous 1979 March 5 gamma ray transient.** Cline, T.L.; Desai, U.D.; Teegarden, B.J.; Evans, W.D.; Klebesadel, R.W.; Laros, J.G.; Barat, C.; Hurley, K.; Niel, M.; Vedrenne, G. (National Aeronautics and Space Administration, Huntsville, AL (USA). George C. Marshall Space Flight Center; Los Alamos Scientific Lab., NM (USA); Toulouse-3 Univ., 31 (France). Centre d'Etude Spatiale des Rayonnements). Dec 1981. 16p. NTIS, PC A02/MF A01.

Refinements in the source direction analysis of the observations of the unusual gamma ray transient are presented. The final results from the interplanetary gamma ray burst network produce a 0.1 arc sq. min. error box. It is nested inside the initially determined 2 arc sq min. source region. This smaller source location is within both the optical and X-ray contours of N49 although not positioned at either contour center.

22150 (NASA-TM—83892) **Spectral evolution of active galactic nuclei: a unified description of the x-ray and gamma.** Leiter, D.; Boldt, E. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Feb 1982. 68p. NTIS, PC A04/MF A01.

A model for spectral evolution is presented whereby active galactic nuclei (AGN) of the type observed individually emerge from an earlier stage at z approx. 4 in which they are the thermal X-ray sources responsible for most of the cosmic X-ray background (CXB). The conjecture is pursued that these precursor objects are initially supermassive Schwarzschild black holes with accretion disks radiating near the Eddington luminosity limit. It is noted that after approx. 10 to the 8th power years these central black holes are spun-up to a canonical Kerr equilibrium state (A/M 0.998 Thorne 1974) and shown how they then can lead to spectral evolution involving non-thermal emission extending to gamma rays, at the expense of reduced thermal disk radiation. That major portion of the CXB remaining after the contribution of usual AGN are considered, while a superposition of AGN sources at z 1 can account for the gamma ray background. Extensive X-ray measurements carried out with the HEAO 1 and 2 missions as well as gamma ray and optical data are shown to compare favorably with principal features of this model.

22151 (NASA-TM—83898) **Spectra of cosmic x-ray sources.** Holt, S.S.; Mccray, R. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Feb 1982. 75p. NTIS, PC A04/MF A01.

Submitted for publication.

X-ray measurements provide the most direct probes of astrophysical environments with temperatures exceeding one million K. Progress in experimental research utilizing dispersive techniques (e.g., Bragg and grating spectroscopy) is considerably slower than that in areas utilizing photometric techniques, because of the relative inefficiency of the former for the weak X-ray signals from celestial sources. As a result, the term spectroscopy as applied to X-ray astronomy has traditionally satisfied a much less restrictive definition (in terms of resolving power) than it has in other wavebands. Until quite recently, resolving powers of order unity were perfectly respectable, and still provide (in most cases) the most useful spectroscopic data. In the broadest sense, X-ray photometric measurements are spectroscopic, insofar as they represent samples of the overall electromagnetic continua of celestial objects.

22152 (NASA-TM—83899) **Charged particle motions in the distended magnetospheres of Jupiter and Saturn.** Birmingham, T.J. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Feb 1982. 37p. NTIS, PC A03/MF A01.

Charged particle motion in the guiding center approximation is analyzed for models of the Jovian and Saturnian magnetospheric magnetic fields based on Voyager magnetometer observations. Field lines are traced and exhibit the distention which arises from azimuthally circulating magnetospheric currents. The spatial dependencies of the guiding center bounce period and azimuthal drift rate are investigated for the model fields. Non-dipolar effects in the gradient-curvature drift rate are most important at the equator and affect particles with all mirror latitudes. The effect is a factor of 10-15 for Jupiter with its strong magnetodisc current and 1-2 for Saturn with its more moderate ring current. Limits of adiabaticity, where particle gyroradii become comparable with magnetic scale lengths, are discussed and are shown to occur at quite modest kinetic energies for protons and heavier ions.

22153 (NASA-TM—83901) **Extragalactic gamma radiation: use of galaxy counts as a galactic tracer.** Thompson, D.J.; Fichtel, C.E. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Feb 1982. 13p. NTIS, PC A02/MF A01.

A derivation of the extragalactic diffuse gamma radiation with energies above 35 MeV was carried out using galaxy counts as a tracer of galactic matter. The extragalactic radiation has a differential photon number spectrum which may be expressed as a power law with index 2.35 (+0.4, -0.3) and an intensity above 35 MeV of

(5.5 + or - 1.3) 0.00001 photons sq cm/s/ster, consistent with previous derivations. Use of a 1/sin of the absolute value of b expression of the galactic component produces a poorer fit, suggesting that the high-latitude galactic gamma-ray production may be dominated by cosmic ray interactions with matter rather than by Compton interactions of cosmic rays with photon fields.

22154 **(NASA-TM—83904) Nuclear processes in solar flares.** Ramaty, R. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Mar 1982. 70p. NTIS, PC A04/MF A01.

The theory of solar gamma-ray line production is reviewed and new calculations of line production yields are presented. Observations, carried out with gamma-ray spectrometers on OSO-7, HEAO-1, HEAO-3 and SMM are reviewed and compared with theory. These observations provide direct evidence for nuclear reactions in flares and furnish unique information on particle acceleration and flare mechanisms.

22155 **(NASA-TM—83909) Neutrino masses, neutrino oscillations, and cosmological implications.** Stecker, F.W. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Mar 1982. 63p. NTIS, PC A04/MF A01.

Theoretical concepts and motivations for considering neutrinos having finite masses are discussed and the experimental situation on searches for neutrino masses and oscillations is summarized. The solar neutrino problem, reactor, deep mine and accelerator data, tri-decay experiments and double beta-decay data are considered and cosmological implications and astrophysical data relating to neutrino masses are reviewed. The neutrino oscillation solution to the solar neutrino problem, the missing mass problem in galaxy halos and galaxy cluster galaxy formation and clustering, and radiative neutrino decay and the cosmic ultraviolet background radiation are examined.

22156 **(NASA-TM—83913) On the acceleration of ions by interplanetary shock waves. 1: Single encounter considerations.** Pesses, M.E. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Dec 1981. 37p. NTIS, PC A03/MF A01.

Submitted for publication Sponsored in part by ONR.

The acceleration of energetic ions in interplanetary magnetosonic fast-mode shock waves was studied via analytical modeling and numerical simulations. An analytical model that combines both the shock drift and compressional acceleration mechanisms is presented. The analytical predictions of the model are shown to be in good agreement with numerical simulation results.

22157 **(NASA-TM—83914) On the acceleration of ions by interplanetary shock waves. 3: High time resolution observations of CIR proton events.** Pesses, M.E.; Vanallen, J.A.; Tsurutani, B.T. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Dec 1981. 35p. NTIS, PC A03/MF A01.

Submitted for publication Sponsored in part by ONR.

Observations within + or - 3 hours of corotating interaction region (CIR) shock waves of proton intensities, pitch angle distribution and crude differential energy spectra of the range of 0.6 E sub p 3.4 MeV are presented. The principle result is the evidence for the persistent flow of particles away from the shock. The observations are found to be in good agreement with the hypothesis of local interplanetary shock acceleration by the shock drift and compression mechanisms. The same set of observations strongly suggest that transit time damping does not play an important role in the acceleration of protons to 1 MeV in the immediate vicinity of CIR shocks.

22158 **(NASA-TM—83920) Helium, hydrogen, and oxygen velocities observed on isee-3.** Ogilvie, K.W. (Maryland Univ., College Park); Coplan, M.A. (LASL). (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Mar 1982. 21p. NTIS, PC A02/MF A01.

REFS Submitted for publication Sponsored in part by Maryland Univ.

The velocities of hydrogen, helium, and oxygen ions over a full range of solar wind conditions were recorded by the ion composition instrument and Los Alamos National Laboratory plasma instrument aboard the International Sun Earth Explorer. Interspecie velocity differences were observed frequently. For solar wind velocities between 300 and 400 km s(-1) the helium velocity exceeded the hydrogen velocity by 5 km s(-1) the average difference was 14 km s(-1), however no evidence was found for a nonzero average velocity difference between helium and oxygen ions even at the higher velocities. Velocity differences were examined in a number of streams and across a number of interplanetary shocks. Generally helium hydrogen velocity differences are bounded by the Alfven speed. Velocity differences show abrupt changes across interplanetary discontinuities, presumably tangential. The electrostatic potential change across a shock produces differences between the velocities of ions having different charges.

22159 **(PB—82-224304) SMS-GOES solar soft x-ray measurements. Part I: SMS-1, SMS-2 and GOES-1 measurements from July 1, 1974 through December 31, 1976. Technical memo.** Donnelly, R.F. (National Oceanic and Atmospheric Administration, Boulder, CO (USA). Space Environment Lab.). May 1981. 203p. (NOAA-TM-ERL-SEL—56). NTIS, PC A10/MF A01.

Solar soft X ray data are presented in daily graphs from July 1, 1974, through December 31, 1976, during the decay of solar cycle 20. Outstanding solar X-ray bursts are shown in detailed two-hour graphs.

22160 **(PB—82-224312) SMS-GOES solar soft x-ray measurements. Part II: SMS-2, GOES-1, GOES-2 and GOES-3 measurements from January 1, 1977 through December 31, 1980. Technical memo.** Donnelly, R.F.; Bouwer, S.D. (National Oceanic and Atmospheric Administration, Boulder, CO (USA). Space Environment Lab.). May 1981. 207p. (NOAA-TM-ERL-SEL—57). NTIS, PC A10/MF A01.

Solar soft X-ray flux measurements in the 1/2-4A and 1-8A wavelength ranges are presented in daily graphs from January 1, 1977, through August 31, 1978, during the rise of solar cycle 21. Outstanding solar X-ray bursts from the period January 1, 1977, through December 31, 1980, are shown in detailed two-hour graphs.

22161 **(PB—82-225590) The ionization state of the solar wind.** Owocki, S.P. (National Center for Atmospheric Research, Boulder, CO (USA)). 1982. 291p. NTIS, PC A13/MF A01.

The solar wind ionization state is 'frozen' within a few solar radii of the photosphere, and measurements of the ions at 1 a.u. can therefore potentially yield information about conditions at the base of the coronal expansion. If ions are assumed to flow at a steady, common bulk speed in a plasma with a Maxwellian electron distribution, the interplanetary ionization state is characteristic of the electron temperature in the coronal 'freezing-in' region. In this thesis, we examine the effect of relaxing one or more of these assumptions.

22162 **(SLAC-PUB—2997) Finite-particle-number approach to physics.** Noyes, H.P. (Stanford Linear Accelerator Center, CA (USA)). Oct 1982. Contract AC03-76SF00515. 10p. (CONF-820473—2). NTIS, PC A02/MF A01. Order Number DE83007014.

From Symposium on wave particle dualism; Perugia, Italy (22 Apr 1982).

Starting from a discrete, self-generating and self-organizing, recursive model and self-consistent interpretive rules we construct: the scale constants of physics (3,10,137,$1.7\text{x}10^{38}$); 3+1 Minkowski space with a discrete metric and the algebraic bound Δ is an element of Δ tau is greater than or equal to 1; the Einstein-deBroglie relation; algebraic double slit interference; a single-time momentum-space scattering theory connected to laboratory experience; an approximation to wave functions; local phase severance and hence both distant correlations and separability; baryon number, lepton number, charge and helicity; m/sub p//m/sub e/; a cosmology not in disagreement with current observations.

22163 (UCRL—52000-82-12) **Energy and Technology Review.** (Lawrence Livermore National Lab., CA (USA)). Dec 1982. Contract W-7405-ENG-48. 35p. NTIS, PC A02/MF A01. Order Number DE83007216.

Individual abstracts were prepared for the three items in this issue. These include age estimation of the universe, measurement of equations of state for tantalum, and inertial confinement fusion. (GHT)

22164 (UCRL—52000-82-12, pp 1-9) **How old is the universe.** Dec 1982. NTIS, PC A02/MF A01.

In Energy and Technology Review.

A new determination has been made of the age of the universe based upon the use of the rhenium-osmium beta-decay clock. The crucial experimental element in this determination was the measurement of the neutron-capture cross sections for osmium-186 and osmium-187, in the energy range corresponding to stellar temperatures. The use of this clock gives a value for the time elapsed between the formation of the Milky Way and the condensation of the solar system, the period during which the present matter of the solar system was undergoing nucleosynthesis in the interior of stars. Including reasonable assumptions and incorporating appropriate uncertainties, the determination of the age of the universe is 17 +- 3 billion years. This value, although significantly larger than the results of previous determinations, agrees with the age of recently discovered galaxies. It is greater, however, than the apparent limit set by the most recent determination of the Hubble time. This difference has implications of crucial significance for cosmology.

22165 **Preliminary determination of the sun's gravitational quadrupole moment from rotational splitting of global oscillations and its relevance to tests of general relativity.** Hill, H.A.; Bos, R.J.; Goode, P.R. (Department of Physics and Arizona Research Laboratories, University of Arizona, Tucson, Arizona 85721). *Physical Review Letters;* **49**: No. 24, 1794-1797(13 Dec 1982).

The sun's internal angular velocity is estimated from observations of rotational splitting of low-order, low-degree global oscillations detected as fluctuations in the limb-darkening function. The inferred rapid rotation implies a unitless gravitational quadrupole moment, J_2, of (5.5 +- 1.3) x 10^{-6}. When this result is combined with two published planetary radar results values of 0.987 +- 0.006 and 0.991 +- 0.006 are obtained for $(1/3)(2+2\gamma-\beta)$, a quantity equal to one in the general theory of relativity. .ID LRK206 .PG 1798 1798

22166 **Applications of atomic collisions physics to astrophysics.** Dalgarno, A. (Harvard-Smithsonian Center for Astrophysics, Cambridge, MA). pp 1-17 of Physics of electronic and atomic collisions. Datz, S. (ed.). Amsterdam, Netherlands; North-Holland Publishing Co. (1982). Contract AC02-76ER02887.

From 12. international conference on the physics of electronic and atomic collisions; Gatlinburg, TN, USA (15 Jul 1981).

A review is presented of the applications of atomic collision physics to the interpretation of astrophysical phenomena. The cosmological significance of accurate measures of the deuterium and helium abundances is pointed out and the uncertainties which arise from the electronic, atomic and molecular processes entering into the analysis of the observations data are noted. Brief mention is made of some observational consequences of massive neutrinos. Limits on the variability of the fundamental constants obtained from atomic emission and absorption line data are summarized.

22167 **Forum on solar activity.** Paris, France; Observatoire de Paris, Section de Meudon (1981). 129p. (In several languages). .

Observations of solar activity are discussed with emphasis on implications for astrophysics and plasma physics. Solar flares are of prime focus, including spectroscopic diagnostics, structure, and physical mechanisms. The determination of flare related magnetic fields, particle acceleration in flares, and solar radio emission accompanying flares are covered. Solar flare theoretical models and the propagation of collisionless shocks in the interplanetary medium was also treated. For individual titles, see N82-25077 through N82-25085.

22168 **Astrophysical opacities and moment methods in the interpretation of spectral observation in atomic spectra.** Merts, A.L. (Los Alamos Scientific Lab., NM). pp 81-90 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

The calculation of astrophysical opacities involves an understanding of atomic and electronic processes. For the most part these processes are well known. While the fundamentals are well known the practical matter of obtaining cross sections and spectral information is a difficult and time-consuming task. The most important physical processes which need to be considered for opacity calculations are given and details of the method are discussed. (WHK)

22169 **(AD-A—115512/6) Neutron decay electron injection into the magnetosphere. Master's thesis.** Hanson, B.L. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Mar 1982. 83p. (AFIT/GNE/PH—82-8). NTIS, PC A05/MF A01.

A model to determine magnetospheric electron fluxes from bomb neutron decay is presented. The source of electrons was determined from a neutron decay model dependent on a 37 group neutron spectrum of a nuclear detonation. Monte-Carlo simulation of the decay process determined the electron energy and angular spectra as a function of neutron energy. The Air Force Weapons Laboratory's PROMPT code generates neutron spectra from a nuclear detonation at an observer. Using this neutron spectrum and the electron energy and angular distributions from neutron decay theory, an algorithm was developed to calculate the electron flux. An example of a 1 kt burst at 20 km shows that fluxes above normal background can be observed as far away as 400 km. Higher bursts or bursts of larger magnitude will produce higher fluxes at this distance. It is thus concluded that neutron decay alone can generate significant numbers of energetic electrons in the magnetosphere. Their effect may prove to be of tactical significance in medium to high altitude burst scenarios where fission debris is a less significant source of electrons.

22170 **(N—82-18241) Space experiments with particle accelerators.** Obayashi, T. (Tokyo Univ. (Japan)). Nov 1981. 4p. NTIS, PC A08/MF A01.

In NASA. Marshall Space Flight Center Spacelab Mission 1 Expt. Descriptions 4 p (SEE N82-18234 09-12).

The purpose of space experiments with particle accelerators (SEPAC) is to carry out active and interactive experiments on and in the Earth's ionosphere and magnetosphere. It is also intended to make an initial performance test for an overall program of Spacelab/SEPAC experiments. The instruments to be used are an electron beam accelerator, magnetoplasma dynamic arcjet, and associated diagnostic equipment. The accelerators are installed on the pallet, with monitoring and diagnostic observations being made by the gas plume release, beam-monitor TV, and particle-wave measuring instruments also mounted on the pallet. Command and display systems are installed in the module. Three major classes of investigations to be performed are vehicle charge neutralization, beam plasma physics, and beam atmosphere interactions. The first two are mainly onboard plasma physics experiments to measure the effect of phenomena in the vicinity of Spacelab. The last one is concerned with atmospheric modification and is supported by other Spacelab 1 investigations as well as by ground-based, remote sensing observations.

22171 **(N—82-18243) Atmospheric emission photometric imaging.** Mende, S.B. (Lockheed Missiles and Space Co., Palo Alto, CA (USA)). Nov 1981. 4p. NTIS, PC A08/MF A01.

In NASA. Marshall Space Flight Center Spacelab Mission 1 Expt. Descriptions 4 p (SEE N82-18234 09-12).

A dual-channel video system mounted on a stabilized two-axis gimbal system (mounted on the pallet) with associated optics and data handling electronics is described. Low light flux observations are required for: (1) investigating ionospheric transport processes by observing Mg+ ions (2) supporting magnetospheric electron bounce experiments (3) measuring electron cross sections for selected atmospheric species (4) detecting small particle contamination and (5) studying natural auroras.

22172 (N—82-26097) Measurement of plasma drifts in planetary magnetospheres. Grard, R.; Haerendel, G.; Melzner, F. (European Space Research and Technology Centre, Noordwijk (Netherlands)). Nov 1981. 8p. NTIS, PC A12/MF A01.

In ESA The Solar System and its Exploration p 97-104 (SEE N82-26087 16-88) REFS.

The GEOS satellites instrumentation is described. Plasma drift velocity and electric field are measured simultaneously and independently. The electric field sensor is an antenna made of two spherical probes separated by a distance of 40 m along a direction perpendicular to the spin axis. The field component measured by the aerial is derived from the difference between the electric potential of the two electrodes. The strength and orientation of the total field vector is computed, assuming that the electric and ambient magnetic fields are perpendicular. Plasma drift is measured, using four electron guns and one electron detector. The drift is evaluated by injecting an artificial beam with a 90 deg pitch angle and measuring its displacement after one or two gyrations.

22173 (NASA-CR—164799) Kinetic response of ionospheric ions to onset of auroral electric fields. Chiu, Y.T. (Aerospace Corp., El Segundo); Kan, J.R. (Alaska Univ., Fairbanks (USA)). Jul 1981. 38p. NTIS, PC A03/MF A01.

Aerospace Corp. REFS.

By examining the exact analytic solution of a kinetic model of collisional interaction of ionospheric ions with atmospheric neutrals in the Bhatnagar-Gross-Krook approximation, we show that the onset of intense auroral electric fields in the topside ionosphere can produce the following kinetic effects: (1) heat the bulk ionospheric ions to approximately 2 eV, thus driving them up to higher altitudes where they can be subjected to collisionless plasma processes (2) produce a non-Maxwellian superthermal tail in the distribution function and (3) cause the ion distribution function to be anisotropic with respect to the magnetic field with the perpendicular average thermal energy exceeding the parallel thermal energy.

22174 (NASA-TM—83923) A broad-band vlf-burst associated with ring-current electrons. Maeda, K. (National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center). Mar 1982. 26p. NTIS, PC A03/MF A01.

Submitted for publication.

Frequency band broadening takes place just outside of the nighttime plasmasphere, where the density of cold plasma is known to be very low during the later phase of a geomagnetic storm. Instead of the gradual broadening of several hours duration, a burst type broadening of VLF emission lasting less than ten minutes was observed by Explorer 45 in a similar location. The magnetic field component of this emission is very weak and the frequency spreads below the local half electron cyclotron frequency. Corresponding enhancement of the anisotropic ring current electrons is also very sudden and limited below the order of 10 keV without significant velocity dispersion, in contrast to the gradual broadening events. The cause of this type of emission band spreading can be attributed to the generation of the quasielectrostatic whistler mode emission of short wavelength by hot bimaxwellian electrons surging into the domain of relatively low density magnetized cold plasma. The lack of energy dispersion in the enhanced electrons indicates that the inner edge of the plasma sheet, the source of these hot electrons, is not far from the location of this event.

A maximum of 101 angular points can be used.

BESFIT calculates differential elastic scattering cross sections using a Bessel function expansion, based on a diffraction model. Constant terms may either be supplied as input data or obtained by a least squares fitting of the data.CDC6600; FORTRAN IV; Standard monitor.

22177 (CONF-810705—8) Alternative approach to the surface-excitation model. Krohn, V.E. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01. Order Number DE83007870.

From 16. annual conference of the Microbeam Analysis Society; Vail, CO, USA (13 Jul 1981).

Although the development of the surface-excitation model of sputtered-ion emission involved a detailed description of the ionization process, one can arrive at the same result by assuming an equilibrium treatment, e.g. the Saha-Langmuir equation, with the temperature falling as the collision casade develops. This suggests that, even if situations are found where the surface-excitation model is successful, it does not follow that the original detailed description of the ionization process is correct. Nevertheless, the surface-excitation model does contain an interesting new idea which should not be overlooked, i.e. that atoms sputtered during the early stages of a collision cascade will be relatively energetic, and to the extent that the Saha-Langmuir equation has some applicability, will have a probability of positive ionization which will be low for atoms of low ionization potential (I < phi where I is the ionization potential and phi the work function) and high for atoms of high ionization potential (I > phi), relative to lower-energy atoms emitted during the later stages of the collision cascade. The extended abstract will discuss recent experimental results.

22178 (CONF-810728—8) Collisional effects in the passage of fast molecular ions through thin foils. Gemmell, D.S. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 32p. NTIS, PC A03/MF A01. Order Number DE83007937.

From 9. international conference on atomic collisions in solids; Lyon, France (6 Jul 1981).

Some recent developments in studies on the interactions of fast molecular-ion beams with thin foil targets are discussed. 40 references.

22179 (CONF-810868—5) Comparisons between theory and experiment in two-electron systems. Berry, H.G.; DeSerio, R.; Brooks, R.L. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 19p. NTIS, PC A02/MF A01. Order Number DE83007927.

From 6. international conference on fast ion beam spectroscopy; Quebec, Canada (17 Aug 1981).

Recent measurements of the wavelengths of the 1s2s ${}^3S_1$ - 1s2p ${}^3P_{0\ 2}$ transitions in helium-like ions of nuclear charge $Z = 8$ to 26 at several laboratories, including Argonne, Notre Dame, Oxford, Lyon, Berkeley, and Lund are reported. The precision of some of these measurements is sufficient to test the QED contributions to these transition energies to a few parts per thousand.

22180 (CONF-810868—7) Doubly excited states in some light atoms. Berry, H.G.; Brooks, R.L.; Hardis, J.E.; Ray, W.J. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 18p. NTIS, PC A02/MF A01. Order Number DE83007928.

From 6. international conference on fast ion beam spectroscopy; Quebec, Canada (17 Aug 1981).

We have identified a singlet transition in doubly excited helium: $2p^2\ ^1D$ - $2p3d\ ^1D$, at 3298 +- 2A with a full width of 54A or 0.061 +- 0.005 eV. This width is in good agreement with a previous measurement and theory for the width of the $2p^2\ ^1D_2$ state. We have remeasured the decay rate of $1s^22p^2P$ - $1s2p^2\ ^2P$ in Li I and find it is in good agreement with theory. Several transitions in doubly excited Li II have been identified in the 1000A region. No evidence was found for doubly excited quartet transitions in Li I in the vacuum ultraviolet. We present measurements of wavelengths and fine structure of the $1s2s2p^2\ ^5P$ - $1s2p^3\ ^5S$ transitions in C III, N IV and O V.

22181 (CONF-820853—4) VUV spectroscopy of rare gas van der Waals dimers. Dehmer, P.M.; Pratt, S.T. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 68p. NTIS, PC A04/MF A01. Order Number DE83007864.

From NATO conference on photophysics and photochemistry in the vacuum ultraviolet; Lake Geneva, WI, USA (15 Aug 1982).

We have undertaken a systematic study of the photoionization spectra of the homonuclear and heteronuclear rare gas dimers in order to better understand the nature of the bonding in the Rydberg states adnd ions of these molecules. We have obtained results for Ar_2, Kr_2, Xe_2, NeAr, NeKr, NeXe, ArKr, ArXe, and KrXe. Of the remaining dimer species (Ne_2 and the Herare gas dimers), only Ne_2 has been studied using photoionization mass spectrometry. The results of the present series of experiments provide information both on the excited states of the neutral dimers and on the ground and excited states of the dimer ions. Using the data obtained in these measurements, we are able to compile for the first time a nearly complete list of ground state dissociation energies for the homonuclear and heteronuclear rare gas dimer ions. Somewhat less complete results are obtained for the excited states of these species. The observed trends in binding energy provide an excellent example of the systematic changes that occur as a result of changes in atomic orbital energies, polarizability, and internuclear distance, and these trends can be explained qualitatively in terms of simple molecular orbital theory.

22182 (CONF-8106100—6) Molecular-beam, laser-rf, double-resonance studies of calcium monohalide radicals. Childs, W.J.; Cok, D.R.; Goodman, L.S. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01. Order Number DE83007690.

From International conference on laser spectroscopy; Alberta, Canada (29 Jun 1981).

The molecular-beam, laser-rf, double-resonance technique has been described a number of times. In essence, the occurrence of a radiofrequency (rf) transition in the electronic ground state of the molecule under study is detected by an increase in the laser-induced fluorescence of the molecular beam when the rf is on resonance. The technique makes it possible to measure small energy splittings (normally spin-rotational or hyperfine) in the electronic ground state of a molecule to an absolute precision of 1 kHz. The sensitivity of the technique is high because even a very small increase in fluorescence can be easily seen if the rf is swept repeatedly and digital data-handling techniques are used. The technique is useful for ionic as well as for neutral atoms and molecules.

22183 (CONF-8204113—1) Cross sections for inelastic scattering of electrons by atoms: selected topics related to electron microscopy. Inokuti, M.; Manson, S.T. (Argonne National Lab., IL (USA); Georgia State Univ., Atlanta (USA). Dept. of Physics and Astronomy). 1982. Contract W-31-109-ENG-38. 74p. NTIS, PC A04/MF A01. Order Number DE83007185.

From Conference on electron beam interactions and solids for microscopy, microanalysis and microlithography; Asilomar, CA, USA (18 Apr 1982).

We begin with a resume of the Bethe theory, which provides a general framework for discussing the inelastic scattering of fast electrons and leads to powerful criteria for judging the reliability of cross-section data. The central notion of the theory is the generalized oscillator strength as a function of both the energy transfer and the momentum transfer, and is the only non-trivial factor in the inelastic-scattering cross section. Although the Bethe theory was initially conceived for free atoms, its basic ideas apply to solids, with suitable generalizations; in this respect, the notion of the dielectric response function is the most fundamental. Topics selected for discussion include the generalized oscillator strengths for the K-shell and L-shell ionization for all atoms with $Z \leqq 30$, evaluated by use of the Hartree-Slater potential. As a function of the energy transfer, the generalized oscillator strength most often shows a non-monotonic structure near the K-shell and L-shell thresholds, which has been interpreted as manifestations of electron-wave propagation through atomic fields. For molecules and solids, there are additional structures due to the scattering of ejected electrons by the fields of other atoms.

22184 (CONF-8205110—3) Dissociation in small molecules. Dehmer, P.M. (Argonne National Lab., IL (USA)). 1982. 6p. NTIS, PC A02/MF A01. Order Number DE83007596.

From Desorption induced by electronic transitions conference; Williamsburg, VA, USA (12 May 1982).

The study of molecular dissociation processes is one of the most interesting areas of modern spectroscopy owing to the challenges presented bt even the simplest of diatomic molecules. This paper reviews the commonly used descriptions of molecular dissociation processes for diatomic molecules, the selection rules for predissociation, and a few of the principles to be remembered when one is forced to speculate about dissociation mechanisms in a new molecule. Some of these points will be illustrated by the example of dissociative ionization in O_2.

22185 (CONF-8206159—1) Generation of beams of refractory-metal clusters. Wexler, S.; Riley, R.J.; Parks, E.K.; Mao, C.R.; Pobo, L.G. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 8p. NTIS, PC A02/MF A01. Order Number DE83007618.

From NATO Advanced Study Institute conference on the impact of cluster physics in materials; Cap d'Agde, France (13 Jun 1982).

Interest in the physical and chemical properties of small metal clusters has recently stimulated the development of sources for the generation of molecular beams of metal clusters, since the collision-free environment of a beam has the advantage of permitting in-flight study of isolated species free of interference from surroundings. For example, spectroscopic studies utilizing tunable lasers may be performed in the molecular beam environment. The objectives of our research program are the elucidation of the physical and chemical properties of clusters of refractory metal atoms, in particular those of the catalytically active transition metals. For these purposes we have built and tested two sources suitable for generation of cluster beams of refractory metals, one for continuous beams and the other for pulsed beams.

22186 (CONF-8209101—2) Outer-shell excitation mechanisms and static-mode laser-fluorescence spectroscopy of sputtered atoms. Gruen, D.M.; Pellin, M.J.; Young, C.E.; Mendelsohn, M.H.; DeWald, A.B. (Argonne National Lab., IL (USA); Georgia Inst. of Tech., Atlanta (USA). Nuclear Engineering Dept.). 1982. Contract W-31-109-ENG-38. 59p. NTIS, PC A04/MF A01. Order Number DE83007657.

From Inelastic ion, surface collision conference; Middlefart, Denmark (21 Sep 1982).

A review of the literature on atoms sputtered in electronically excited states is given together with a discussion of various mechanisms that have been proposed to account for the observations. The major observational features that have emerged from the older studies may be summarized as follows: (1) the kinetic energies of neutral atoms in highly excited electronic states are 1-2 orders of magnitude greater than E/sub b/, the surface binding energy; (2) relative yields show approximately exponential dependence on excitation energy with characteristic temperatures measured in thousands of degrees; (43) absolute yields are lower by 2-3 orders of magnitude than secondary ion yields which themselves are usually very small compared to total sputtering yields. In many cases, excited-state yields increase 1-2 orders of magnitude as a result of surface oxidation. 83 references.

22187 **(CONF-8210128—1) Laser excitation.** Huang, K.N. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 3p. NTIS, PC A02/MF A01. Order Number DE83007821.

From Current trends in atomic spectroscopy workshop; Tucson, AZ, USA (24 Oct 1982).

Topics covered include: effects of parity non-conserving weak neutral interactions in atoms; spectroscopy of exotic atoms; and relativistic many-body dynamic theories. (GHT)

22188 **(DOE/ER/02197—78) Hadronic atoms. Technical progress report, February 1, 1982-January 31, 1983.** Kunselman, R. (Wyoming Univ., Laramie (USA). Dept. of Physics and Astronomy). 1983. Contract AC02-76ER02197. 10p. (COO—2197-78). NTIS, PC A02/MF A01. Order Number DE83003047.

Research at LAMPF, BNL, and TRIUMPF on mesonic atoms is briefly described. X-ray transition studies of pionic chromium isotopes, carbon isotopes, hydrogen, lead 208, bismuth 209, and deuterium are discussed. (WHK)

22189 **(DOE/ER/10431—T1) Interaction of low-energy electrons with surface lattice vibrations. Progress report and future research plans.** Tong, S.Y. (Wisconsin Univ., Milwaukee (USA)). 1983. Contract AC02-79ER10431. 54p. NTIS, PC A04/MF A01. Order Number DE83008079.

The principal focus of the program has been to develop the theory of electron energy losses induced by scattering off vibrational quanta in the regime where the electron is deflected far off the specular direction. Theoretical studies of the lattice dynamics of ordered overlayers of atoms on crystal surfaces have continued. Large-angle energy-loss data have allowed the study of the dispersion relation of a particular surface phonon on the Ni(100) surface, from the center of the two-dimensional Brillouin zone out to the zone boundary in the (110) direction. (GHT)

22190 **(DOE/ER/10893—1) Kinetic studies following state-selective laser excitation. Progress report, March 15, 1981-March 14, 1983.** Keto, J.W. (Texas Univ., Austin (USA)). Sep 1982. Contract AS05-81ER10893. 27p. NTIS, PC A03/MF A01. Order Number DE83007968.

In the past contract period, we initiated studies of excitation transfer reactions from excited states of xenon atoms and excimers produced selectively by two photon laser excitation. Work in the initial period has concentrated on several phases of the program. We have made laser spectrographic studies of pure rare gases to verify our calculated two photon transition rate, to identify the atomic and molecular species of interest, and to determine branching fractions for product states in collisions of excited rare gas atoms with other rare gases. We have continued development of a high repetition rate picosecond laser which operates in the uv. Combined with channel plate photomultipliers we will be able to measure decay times on the order of 20 psec with the precision of the single photon delayed coincidence techniques. We are building a new apparatus featuring a high-pressure flow reactor. The flow reactor will enable us to study energy transfer to molecular reactants. In spectrographic experiments we find that laser excitation when detuned from an atomic resonance can excite atoms during a collision at a particular internuclear separation. We observe that atoms which are excited during a collision react quite differently than atom excited at atomic resonances.

22191 **(DOE/ER/10908—2) Studies of magnetism and exchange scattering in solids using synchroton radiation and spin-polarized photoemission. Progress report, June 1, 1982-May 31, 1983.** Rothberg, G.M. (Stevens Inst. of Tech., Hoboken, NJ (USA)). Jan 1983. Contract AC02-81ER10908. 14p. NTIS, PC A02/MF A01. Order Number DE83007329.

Some of the experiments necessary for proving the existence of Spin Polarized EXAFS (SPEXAFS) and for establishing it as a useful techncique for studying magnetism in solids have been carried out at the Stanford Synchrotron Radiation Laboratory (SSRL) and the National Synchrotron Light Source (NSLS). Transmission EXAFS, which does not depend on electron spin, has been measured in several manganese compounds. The 3s photopeaks of Mn^{2+} in MnF_2 have been shown to display EXAFS-like oscillations. The pin dependence of these oscillations will next be studied. Observations of the 3p photopeaks of iron metal on a palladium substrate have shown anomalous intensity variations with varying photon energy. This phenomenon will also be studied further. The existence of Cooper minima in the iron 3s and 3p photoabsorption cross sections has been sought, and this investigation will continue.

22192 **(DOE/ER/40010—964) Improved Cs^0 source for the production of polarized H^- ions.** Wise, T.; Haeberli, W. (Wisconsin Univ., Madison (USA)). 1982. Contract AC02-81ER40010. 3p. (CONF-820941—13). NTIS, PC A02/MF A01. Order Number DE83007325.

From 5. international symposium on high energy spin physics; Upton, NY, USA (16 Sep 1982).

A recent paper describes the production of a 3 μA D.C. beam of polarized H^- by ionization of polarized H^0 atoms with a 3 particle-mA Cs^0 beam of 40 keV energy. An improved Cs gun is described which yields 10 particle-mA Cs^0.

22193 **(DOE/EV/05784—5) Selective excitation, relaxation, and energy channeling in molecular systems. Progress report, December 1, 1981-November 30, 1982.** Rhodes, W.C. (Florida State Univ., Tallahassee (USA)). 1982. Contract AS05-78EV05784. 9p. NTIS, PC A02/MF A01. Order Number DE83007967.

Topics discussed include the nature of molecular resonances, nonradiative relaxation and quantum beats in the radiative decay dynamics of large molecules, and the case for linear response theory. (WHK)

22194 (LA—9572-C-Vol.1, pp 180-186) **Muonium.** Egan, P.O. (Yale Univ., New Haven, CT). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

Recent developments in precision muonium measurements and vacuum muonium experiments are reviewed. Prospects for future improvements in this field at LAMPF II are discussed.

22195 (LA—9572-C-Vol.1, pp 270-281) **Studies of magnetic phase transitions with muons.** Dodds, S.A. (Rice Univ., Houston, TX). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

The asymmetric decay of the muon can be used to probe solid state phenomena. As an example, the use of muons to study the phase transition of a disorder magnetic system is discussed. The advantages of the proposed new facilities are shown to be substantial.

22196 **(LA-UR—83-352) Electronic structure and bonding in transuranics: comparison with lanthanides.** Ward, J.W. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 19p. (CONF-830419—1). NTIS, PC A02/MF A01. Order Number DE83007549.

From 16. rare earth research conference; Tallahassee, FL, USA (18 Apr 1983).

The physico-chemical properties of the actinide metals, alloys, and compounds show interesting parallels and contrasts with the rare earths, beyond uranium. At first there is a transition region where the unique bonding properties of the early actinides become less prominent, due to progressive f-electron localization. Nevertheless, in contrast to the rare earths, f-electron energies remain close to the Fermi level, resulting in complex behavior as a function of temperature, pressure and structure. Particularly interesting in this region are the metallic hydrides, whose chemistry is clearly rare-earth like, but whose electronic properties are entirely different. At americium a major localization and f-band narrowing occurs, but the explanation of americium behavior is obscured by the occurrence of the unique f^6 non-magnetic solid-state configuration. Beyond americium, it would appear that real rare-earth-like behavior finally begins; this has been born out by recent studies on the thermodynamics and cohesive energies of curium, berkelium, californium and einsteinium metals. However, a new complication arises almost immediately, in the onset of incipient stabilization of the divalent state, which already appears in californium, whose physico-chemical properties are remarkably similar to samarium. Einsteinium appears to be fully divalent, thus heralding the beginning of a mini-series of truly divalent metals.

22197 (LP—193) Excitation of nitrogen in a luminous discharge. Massabieaux, B. (Paris-11 Univ., 91 - Orsay (France)). Feb 1982. 133p. (French). NTIS, PC A07/MF A01.

REFS.

Temporal relaxation of the excited states of molecular nitrogen, including ionized molecular states, was investigated. A continuous electric discharge in a positive plasma column was studied, using emission spectroscopy. A model of N_2 energy levels in the discharge, based on kinetic theory, is presented. Experimental measurement of electron density, electric field, and gas temperature is described. Results from spectrum analysis of the positive second and negative first line systems give the spatial and vibrational distributions of the population of states. The equations that govern these states, when coupled with the Boltzmann equation, allow a non-Maxwellian solution to the electron energy distribution function.

22198 (MPIS—10/1981) Rainbow scattering of low energy Li ions on W single crystal surfaces, with special regard to the azimuthal dependence. Mann, K.R. (Max-Planck-Institut fuer Stroemungsforschung, Goettingen (Germany, F.R.)). Jun 1981. 118p. (German). NTIS, PC A06/MF A01.

REFS.

In-plane angular distributions and energy loss spectra were taken with the time of flight method. (Angular distributions were also taken during cooling of the crystal after heating up to about 2000 K.) The dependence of the scattering on the azimuthal orientation of the surfaces was studied. A strongly pronounced rainbow structure with minimum two maxima appears in the angular distributions for incidence angles between 10 and 70 deg. Energy loss spectra have no significant azimuthal dependence, contrary to angular distributions. The azimuthal dependence is explained by the crystal surface anisotropy. Trajectory calculations were conducted for quantitative comparison of theory and experiment.

22199 (N—82-24929) A selected ion flow tube investigation on the quenching of N_2 (v not equal to o) by various neutrals. Dobler, W.; Howorka, F.; Lindinger, W. (Innsbruck Univ. (Austria)). 1982. 4p. NTIS, PC A16/MF A01.

In its Symp. on Atomic and Surface Phys., 1982 Contrib. p 295-298 (SEE N82-24880 15-70) REFS Sponsored by Oesterreichischer Fonds zur Foerderung der Wissenschaftlichen Forschung.

A selected ion flow tube (SIFT) was used to determine rate coefficients for the quenching of the vibration of $N_2(+)$ (v not equal to) by Ne, O_2, N_2, NO, and CO_2. Values of 0.045, 1.2, 5, equal to or 0.3, and 1 were obtained. The values are all in units of 0.0000000001 cu cm per 0.1 second.

22200 (N—82-25047) Prediction of molecular infrared band and line intensities. Person, W.B. (Florida Univ., Gainesville (USA)). Apr 1982. 35p. NTIS, PC A18/MF A01.

In NASA. Goddard Space Flight Center Vibrational-Rotational Spectry. for Planetary Atmospheres, Vol. 1 p 89-124 (SEE N82-25043 15-91) REFS.

The general problem of predicting infrared intensities is examined. The problem of predicting line intensities is discussed with attention focussed specifically on the problem of predicting vibrational strengths (or total band intensities). Two methods are considered: predictions based on ab initio quantum mechanical calculations, and predictions based on the transfer of atomic polar tensor parameters from small model molecules to the molecule of interest. Comparisons of predicted spectra with experimental spectra are shown for CH_3OH, CH_3OCH_3, C_2H_5OH, and HOC_2. It is suggested that the most important application of this work may be to the prediction of intensities for free radicals, ions, and reactive intermediates so that the infrared spectrum can be used in the quantitative analysis for these interesting species.

22201 (N—82-25048) New theoretical and experimental methods for pessure broadened linewidths and their interpretation. Gelfand, J.J. (Princeton Univ., NJ (USA)). Apr 1982. 23p. NTIS, PC A18/MF A01.

In NASA. Goddard Space Flight Center Vibrational-Rotational Spectry. for Planetary Atmospheres, Vol. 1 p 125-148 (SEE N82-25043 15-91) REFS.

A review of recent progress in the theory of collisional line broadening, particularly the impact of recent advances in collision dynamics calculations is presented. Some new approaches to the interpretation of experimentally measured linewidths and their impact on planetary atmosphere research are discussed. Experimental techniques which may have some advantage in providing pressure broadening data at very low temperatures are also mentioned.

22202 (N—82-25049) Laboratory molecular spectroscopy. Margolis, J. (Jet Propulsion Lab., Pasadena, CA (USA)). Apr 1982. 21p. NTIS, PC A18/MF A01.

In NASA. Goddard Space Flight Center Vibrational-Rotational Spectry. for Planetary Atmospheres, Vol. 1 p 149-170 (SEE N82-25043 15-91).

The precision required in making spectroscopic measurements is discussed. Remarks are directed specifically to vibration-rotation spectra rather than continuum absorptions. The ultimate precision that is required for line positions is related to the width of the lines which may be no narrower than the Doppler width. The spectroscopic methods considered are those which are of the most general value to the astronomers, those which acquire and can handle large volumes of spectra in digital form, or in a form which is compatible with computer analysis, and in a form which is at least internally consistent. The use of dye laser, grating instruments, and the most versatile instrument for laboratory spectroscopy, the Fourier transform spectrometer is discussed.

22203 (NASA-CR—168999) N_2 pressure - broadened O_3 line widths and strengths near 1129.4 cm-1. Copeland, G.E.; Majorana, L.N.; Harward, C.N.; Steinkamp, R.J. (Old Dominion Univ., Norfolk, VA (USA)). Jun 1982. 30p. NTIS, PC A03/MF A01.

REFS.

A Beer's Law experiment was performed with a tunable diode laser to find the N_2 pressure broadening characteristics of a single 0_3 absorption line at 1129.426 cm for N_2 pressures from 10 to 100 torr (O_3 pressure 3.16 torr). SO_2 line positions were used for wavelength calibration. Line shapes were interatively fitted to a Lorentz function. Results were delta (HWHM in MHz) 47.44 (+ or - 5.34) MHz + 1.730 (+ or - 0.088) MHz/torr *p(torr) with sigma 0.9897. This intercept compares well with the Doppler O_3 - O_3 broadened (at 3.16 torr) width of 44.52 Hz. This result in a HWHM line width of 0.44 cm atm at 760 torr and 285 K. The line strengths integrated over delta nu 0.55 cm were found to be N_2 pressure dependent.

22204 (PB—82-226903) The multiple scattering optical potential for scattering of electrons on he atom. Dymarz, R. (Oxford Univ. (UK). Nuclear Physics Lab.). 1982. 17p. NTIS, PC A02/MF A01.

The optical model potential has been derived from the Glauber multiple scattering series. Using this potential in a wave equation we are able to considerably improve the description of electron scattering on atoms in comparison with the original Glauber model. However our real potential is too weak (it has no 1/r to the 4th power component) to reproduce the scattering at small angles.

22205 Supersonic metal cluster beams of refractory metals: Spectral investigations of ultracold Mo_2. Hopkins, J.B.; Langridge-Smith, P.R.R.; Morse, M.D.; Smalley, R.E. (Rice Quantum Institute and Department of Chemistry, Rice University, Houston, Texas 77251). *Journal of Chemical Physics;* **78**: No. 4, 1627-1637(15 Feb 1983).

A novel technique involving pulsed laser vaporization of the bulk metal within a pulsed supersonic nozzle has been shown to successfully produce ultracold bare metal clusters of even the most refractory of metals, tungsten and molybdenum. Clusters of up to 25 atoms may be readily prepared using this technique. Mass-selective resonant two-photon ionization spectra of Mo_2 produced in this fashion show that the dimer is efficiently cooled in the expansion T/sub trans/<6 K, T/sub rot/~5 K, and T/sub vib/~325 K. We have rotationally resolved the A $^1\Sigma^+$/sub u/←X $^1\Sigma^+$/sub g/ (0—0) band for $^{92}Mo_2$ and determined the bond length in the ground and excited states to be 1.940 +- 0.009 and 1.937 +- 0.008 A, respectively. This confirms and extends the analysis of Efremov et al. [J. Mol. Spectrosc. 73, 40 (1970)] who prepared $^{98}Mo_2$ by flash photolysis of isotopically pure $Mo(CO)_6$. We have also observed the (1—1), (2—2), and (3—3) sequence bands which together with the ground state data of Efremov et al. determine vibrational constants ω/sup prime//sub e/ = 449.0 +- 0.2 cm^{-1} and ω/sub e/x/sup prime//sub e/ = 2.3 +- 0.2 cm^{-1} for the A $^1\Sigma^+$/sub u/ state. The lifetime of the A $^1\Sigma^+$/sub u/ v = 0 state of Mo_2 has been measured to be 18 +- 3 ns by time-delayed two-photon ionization. The ionization potential of Mo_2 is found to be less than 6.42 eV (compared to 7.10 eV for atomic Mo) indicating a substantially stronger chemical bond in $Mo^+{}_2$ than in Mo_2. A discussion of the electronic structure of Mo_2 and the implications of these findings for bonding in other transition metal dimers is also presented.

22206 KVV Auger spectrum of F_2: The importance of hole—hole correlation. Weightman, P.; Thomas, T.D.; Jennison, D.R. (Department of Chemistry, Oregon State University, Corvallis, Oregon 97331). *Journal of Chemical Physics;* **78**: No. 4, 1652-1662(15 Feb 1983).

The KVV Auger spectrum of F_2 has been measured and analyzed in terms of theoretical models of different levels of sophistication. In contrast to the corresponding spectra of many small molecules, this spectrum cannot be described in terms of an independent-particle model. The approach suggested by Thomas and Weightman, which allows in an approximate way for hole—hole interaction, gives noticeably improved results. A more accurate, configuration-interaction treatment developed by Jennison gives reasonable agreement with experiment. Peak assignments based on comparison of this theory with the experimental spectrum have been made. This spectrum provides a very clear case where hole—hole correlation effects are important. The experimental spectrum is unusual in that the lines are generally narrow, in contrast to many KVV spectra, which often have quite broad lines. The ionization potentials for the 2σ/sub g/ and 2σ/sub u/ orbitals have been measured. The relative cross sections for ionization from these orbitals are equal, suggesting that those orbitals arise almost entirely from fluorine 2s atomic orbitals, with little admixture from 2p.

22207 Vibrational-rotational energy transfer in collisions of HF (v = 4, J = 20) with rare gases. Thompson, D.L. (University of California, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Chemical Physics;* **78**: No. 4, 1763-1766(15 Feb 1983).

State-to-state energy transfer cross sections for He and Ne+HF(v = 4, J = 20) at 0.2 eV initial relative translational energy were computed using quasiclassical trajectories. These results are compared with previously published results for Ar+HF at the same initial conditions. The results show that the number of final J states populated in a given final v state increases and that the magnitudes of the state-to-state cross sections decreases as the size of the rare gas atom decreases. The cross sections for vibrational transitions are not sensitive to the size of the rare gas atom.

22208 Application of the semiclassical perturbation (SCP) approximation to diffraction and rotationally inelastic scattering of atoms and molecules from surfaces. Hubbard, L.M.; Miller, W.H. (Department of Chemistry and Materials and Molecular Research Division, Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Journal of Chemical Physics;* **78**: No. 4, 1801-1807(15 Feb 1983).

The semiclassical perturbation (SCP) approximation of Miller and Smith [Phys. Rev. A 17, 17 (1978)] is applied to the scattering of atoms and molecules from crystal surfaces. Specifically, diffraction of He from LiF, and diffraction and rotationally inelastic scattering of H_2 from LiF are treated, and the SCP model is seen to agree well with earlier coupled-channel and quantum sudden calculations. These tests of the SCP model are all for "soft" interaction potentials, e.g., of the Lennard-Jones Devonshire variety, but it is also shown that the model behaves correctly in the limit of an impulsive hard-wall potential function. The SCP picture thus appears to have a wide range of validity for describing the dynamics of gas-surface collisions.

22209 Semiclassical vibrational spectra for diatomic molecules: Application to HF, CO, and NO. Stine, J.R.; Noid, D.W. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Chemical Physics;* **78**: No. 4, 1876-1883(15 Feb 1983).

Semiclassical dipole-moment matrix elements are calculated for HF, CO, and NO using realistic dipole-moment functions, and are in excellent agreement with those calculated from quantum mechanics. The first two cases have the Δn = 1 vibrational transition exhibiting a maximum at excited vibrational states and then becoming nearly forbidden at higher vibrational states; in this region, the Δn = 2 transition becomes more probable than the Δn = 1 transition. This behavior is also expected for NO or for any heteronuclear diatomic molecule whose dipole moment has a maximum at an internuclear distance greater than r/sub e/.

22210 Theoretical hyperfine structure of the muonic ^3He and ^4He atoms. Huang, K.; Hughes, V.W. (Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review [Section] A: General Physics;* **26**: No. 5, 2330-2333(Nov 1982). Contract W-31-109-ENG-38.

The hyperfine structures of the muonic ^3He atom ($^3He\mu^-e^-$) and the muonic ^4He atom ($^4He\mu^-e^-$) are calculated with the use of variational wave functions. Relativistic and radiative corrections are included. The theoretical hyperfine structure interval is Δν = 4166.8 +- 0.3 MHz for the muonic ^3He atom, and Δν = 4465.0 +- 0.3 MHz for the muonic ^4He atom; these values are in good agreement with the experimental values.

22211 Energy and angle correlations of low energy backscattered light atoms. Oen, O.S.; Robinson, M.T. (Oak Ridge National Lab., TN (USA). Solid State Div.). *Journal of Nuclear Materials;* **111**: 789-794(Nov-Dec 1982). Contract W-7405-ENG-26.

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

The correlation between the emergent energy and angle of H and He atoms that are reflected from solid surfaces has been studied using the computer program MARLOWE. Both polycrystalline and amorphous targets of Al and W have been investigated using normally incident atoms of initial energies from 0.1 to 0.5 keV. The results show that particles reflected with high energy have an angular distribution that is between cosine and isotropic. In contrast, the medium and low energy particles have a distribution that is over-cosine, that is an excess of particles emerge at angles near the surface normal. No essential differences in the shape of the angular distributions were found between the polycrystalline and amorphous targets.

22212 Electron capture in low-energy collisions of C/sup q/+ and O/sup q/+ with H and H_2. Phaneuf, R.A.; Alvarez, I.; Meyer, F.W.; Crandall, D.H. (Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Physical Review [Section] A: General Physics;* **26**: No. 4, 1892-1906(Oct 1982).

Total electron-capture cross-section measurements are reported for C/sup q/+ (3< or =q< or =6) and O/sup q/+ (2< or =q< or =6) ions colliding with hydrogen atoms and molecules in the energy range (0.01< or =E< or =10) keV/amu. The cross sections range from (0.5—7) x 10^{-15} cm^2, and neither obey simple charge-scaling rules, nor exhibit uniform dependences on collision velocity in this energy range. For a given charge q, cross sections for the less-highly-stripped oxygen ions exceed those for carbon ions at energies below a few-hundred eV/amu. Comparison is made between these measurements and theoretical calculations which have heretofore remained untested at low collision energies. In general, the agreement is good for those systems where detailed perturbed-stationary-state theory is available, but is best with those calculations in which the collision dynamics as well as the molecular couplings are treated quantum mechanically. Generalized theories which work well for collision systems containing many bound electrons, do not give accurate representations of these few-electron systems at low energies.

22213 **Photoelectron angular distributions from electron-atom collisions.** White, M.G. (Department of Chemistry, Brookhaven National Laboratory, Upton, New York 11973). *Physical Review* [*Section*] *A: General Physics;* **26**: No. 4, 1907-1914(Oct 1982).

The differential cross section for electron-impact ionization of atoms has been derived for the general case and the dipole (E1) limit of the Born approximation. Emphasis was placed on the theoretical description of the (e,2e) angular correlation between fast electrons scattered in the forward direction and electrons ejected by the ionization process. The general angular-momentum treatment of this work results in a more complete description of the dipole (e,2e) angular distribution than previous purely kinematic analyses.

22214 **Spin-orbit interval in the ground state of F-like ions.** Kim, Y.; Huang, K. (Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review* [*Section*] *A: General Physics;* **26**: No. 4, 1984-1987(Oct 1982). Contract W-31-109-ENG-38.

Recommended spin-orbit intervals in the ground state, $^2p^5$ ^{2}P/sub 3/2/-^{2}P/sub 1/2/, of fluorinelike ions are presented for ions of high nuclear charge (Z< or =56). The recommended values are based on the relativistic Hartree-Fock calculations with corrections deduced from known experimental values in the low-Z side of the sequence.

22215 **Ionization and recombination coefficients for Fe XV—Fe XIX.** Isler, R.C.; Crume, E.C.; Arnurius, D.E. (Fusion Energy Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Physical Review* [*Section*] *A: General Physics;* **26**: No. 4, 2105-2116(Oct 1982).

During neutral-beam-heated, counter-injection discharges in the ISX-B tokamak, impurities tend to collect in the interior of the plasmas. In these circumstances iron ions preferentially accumulate with long confinement times in regions of almost constant electron temperature. The concentrations of intermediate stages of iron (Fe XV, XVI, XVIII, and XIX) have been studied under these conditions to investigate the ratios of recombination and ionization coefficients. The dielectronic recombination coefficients are then deduced by assuming that the ionization and the radiative and charge-exchange recombination rates can be calculated closely from theory.

22216 **Angular distribution and spin polarization of Auger electrons following photoionization and photoexcitation.** Huang, K. (Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review* [*Section*] *A: General Physics;* **26**: No. 4, 2274-2276(Oct 1982). Contract W-31-109-ENG-38.

Angular distribution and spin polarization of Auger electrons following photoionization and photoexcitation are presented in concise parametrized expressions. The striking similarity with corresponding expressions for photoelectrons enables one to apply kinematic properties known for photoelectrons in analyzing Auger electrons.

22217 **Charge distributions of barium isotopes from muonic X-rays.** Shera, E.B.; Wohlfahrt, H.D.; Hoehn, M.V. (Los Alamos National Lab., NM (USA)); Tanaka, Y. (Purdue Univ., Lafayette, IN (USA)). *Physics Letters,* [*Section*] *B;* **112**: No. 2, 124-128(6 May 1982).

The results of a muonic X-ray study of the charge radii of stable barium isotopes are presented and compared with optical isotope shifts. The isotope shifts $\Delta <r^2>$ of a wide range of barium isotopes are found to be in good agreement with the droplet model and with IBA calculations.

22218 **Stochastic calculation of interaction energies.** Alder, B.J. (Lawrence Livermore National Lab., CA); Ceperley, D.M.; Reynolds, P.J. *Journal of Physical Chemistry;* **86**: No. 7, 1200-1204(1982). Contract W-7405-ENG-48.

A Monte Carlo method by which the properties of a collection of interacting nuclei and electrons might be accurately calculated is briefly outlined. This method allows quantitative determination of the pairwise intermolecular potential and potential surfaces but eliminates the use of these constructs for dense systems. Preliminary results on the electron gas, hydrogen solid, and the molecules He_2, LiH, Li_2, and H_2O are at least as accurate as the best previous work.

22219 **Tunable far-infrared radiation from optically pumped potassium Rydberg transitions.** Bookless, W.A. (Lawrence Livermore National Lab., CA); Hrubesh, L.W.; Stevens, C.G.; Rinehart, E.A. *International Journal of Infrared and Millimeter Waves;* **3**: No. 2, 171-187(1982). Contract W-7405-ENG-48.

The generation of tunable far-infrared radiation by the optical pumping of potassium metal vapor to the 13p Rydberg state is reported. Subsequent cascade by stimulated emission is measured at several wavelengths between 76 and 146 cm^{-1} with a conversion quantum efficiency of greater than 10%. Emission observed in this region are tuned up to 18 GHz by the application of a pulsed Stark field across a parallel-plate heat pipe. Cascade branching to the 11 d to 10 f transition at 146 cm^{-1} is observed which can be tuned up to 7 cm^{-1} in the device. Similar branching following excitation up to the 18 p state is shown to provide almost complete tunability in the far-infrared region.

22220 **Monte-Carlo calculations of two- and three-body ionic recombination.** Whitten, B.L. (Rice Univ., Houston, TX); Morgan, W.L.; Bardsley, J.N. *Journal of Physics B: Atomic and Molecular Physics;* **15**: 319-326(1982). Contract W-7405-ENG-48.

The recombination of positive and negative ions in a dense ambient gas is studied using classical Monte-Carlo trajectories. The models used represent Kr^+-F^- in Ar and (Na^+,K^+)-Cl^- in flames with mixtures of H_2, N_2, and O_2 at temperatures between 1800 and 2400°K. The relative importance of two-body and three-body processes, and the branching ratio for the production of neutral atoms or molecules are explored.

22221 **Computer simulations of low-energy neon-ion scattering from nickel crystals.** Helbig, H.F. (Clarkson Coll. of Tech., Potsdam, NY); Linder, M.W.; Morris, G.A.; Steward, S.A. *Surface Science;* **114**: 251-271(1982). Contract W-7405-ENG-48.

The model of successive single binary elastic collisions used by a computer code called ARGUS is sufficiently accurate to reproduce the salient features of energy spectra that result from ion-surface scattering for the neon on nickel system down to incidence energies of 600 eV. Agreement with experimental measurements is at least as good as that obtained by more detailed calculations, which include the interactions of many particles. Many features of the backscattered energy spectra can be associated with a single, or at most a few, specific collision sequences. ARGUS selects sampling areas that are orthogonal to the incident beam direction rather than parallel to the surface. These sampling areas are constructed from polygons formed by the intersection of the Wigner-Seitz cell of an atom with a plane perpendicular to the ion beam direction and passing through the center of the atom. These polygons of surface atoms form an overlapping mosaic. The irreducible portion of this mosaic (a type of primitive cell) that is visible along the ion beam direction is the required sampling area. This approach provides the most economical sampling of the surface.

22222 **Electric dipole transitions in C/sub L/-like ions.** Vajed-Samii, M.; MacDonald, K. (Department of Physics, The Johns Hopkins University, Baltimore, Maryland 21218). *Atomic Data and Nuclear Data Tables;* **26**: No. 5, 467-475(Sep 1981).

Theoretical transition energies, wavelengths, and oscillator strengths for E1 transitions from the low-lying J = 1/2, J = 3/2, and J = 5/2 excited states to the J = 1/2 and J = 3/2 ground states are presented for ten ions isoelectronic with the chlorine atom. The multiconfiguration Dirac—fock technique is used to generate the wave functions and obtain the energy levels. The effect of some correlation with 3d orbitals is noted. The relativistic forms of the electric-dipole operator are used to obtain values of oscillator strength corresponding to the nonrelativistic length and velocity forms.

22223 **Effect of multiple scattering on the intensity of depolarized light.** Weis, J.J. (Universite Paris-Sud, Orsay, France); Alder, B.J. *Chemical Physics Letters;* **81**: No. 1, 113-114(1 Jul 1981). Contract W-7405-ENG-48.

The effect of the higher-order scattering terms on the depolarized light intensity for the inert gases at liquid densities is shown to be negligible by iterating the molecular dynamics calculation.

22224 **Angular distribution of Pb L x-rays excited by 3 MeV protons.** Clark, M. (Univ. of North Carolina, Chapel Hill); Hurst, S.; Shafroth, S.M.; Swenson, J.; Willis, J.E.; Varghese, S.L. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 2, 1117-1118(Apr 1981).

The angular distribution of Pb L1 and L $_{\infty}$ x-rays has been measured in the case of lead where the targets were typically 100 μg/cm^2 thick with a 400 μg/cm^2 layer of silver evaporated on each side. Spectra were obtained at 25, 45, 65, 90, 115, 135 and 155° and ratios of Pb L x-rays to the isotropic Ag K x-rays were taken. The most readily interpretable case is L1 since this transition involves only the Lm subshell. After correcting for x-ray absorption in the target assuming it to be layered (i.e., neglecting diffusion of the Ag in the Pb) a small deviation from isotropy is found which is expected due to enhanced depopulation of M = 0 substates at small impact parameter collisions. The velocity dependence of the alignment parameter A_2 has been calculated using PWBA and screened as well as unscreened wave functions. The results for agree with these calculations. Further work is under consideration.

22225 **Relative population of the levels of the 1s2s2p and 1s2p^2 configurations of argon from three electron excited atoms.** Tunnell, T.W.; Bhalla, C.P. (Kansas State Univ., Manhattan). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-28**: No. 2, 1081-1083(Apr 1981).

The possible contributions of the cascading from higher excited states to the states which can deexcite by the x-ray and Auger processes are investigated for Li-like argon. A model is developed to calculate the probability that a given excited state will eventually populate a particular lower excited state. The model requires the calculation of the transition rates of the cascading levels. Numerical results are presented for the cascade feeding of the levels of the 1s2s2p and 1s2p^2 configurations. The cascading levels considered belong to the 1s2snl and 1s2pnl configurations with nl = 3s,3p,...4f.

22226 **Simulated Lyman-alpha and dielectronic satellite spectra, Z = 6-20.** Seely, J.F. (Optical Sciences Division, Naval Research Laboratory, Washington, DC 20375). *Atomic Data and Nuclear Data Tables;* **26**: No. 2, 137-166(Mar 1981).

The dielectronic satellite transitions originating on the 2/2l' and 2/3l' doubly excited levels of the He-like ions with Z = 6-20 are tabulated in a useful format. The relative intensities of the satellite transitions are listed for the two cases of low electron density (corona equilibrium) and high electron density (Saha equilibrium). This compilation of wavelengths and relative intensities should facilitate the indentification of dielectronic satellite lines in the x-ray spectra of hot plasmas. The Lyman-α and satellite intensity distributions are stimulated by convolving the calculated intensities with Gaussian profiles. These calculated spectra illustrate the blending of the satellite lines and indicate the instrumental resolution necessary to resolve the satellite features in experimental data. Also included is a bibliography of published experimental spectra for the satellites of the Lyman-α line of moderate-Z ions in dense laboratory plasmas.

22227 **Branching ratios and photoelectron angular distributions through the Hopfield bands in N_2 between 650 and 730 A.** West, J.B. (Univ. of Maryland, College Park); Codling, K.; Parr, A.C.; Ederer, D.L.; Cole, B.E.; Stockbauer, R.; Dehmer, J.L. *Journal of Physics B: Atomic and Molecular Physics;* **14**: 1791-1801(1981).

Vibrationally and angularly resolved photoelectron spectra have been recorded in the wavelength range 650 to 730 A for N_2, in the region of the autoionizing resonances leading to the B $^2\Sigma$/sub u/$^+$ state of the N_2^+ ion. The influence of these resonances on both the partial cross sections to the A ^{2}PI/sub u/ state and the X $^2\Sigma$/sub g/$^+$ state (the branching ratios) and the angular distribution of the photoemitted electrons is clearly demonstrated.

22228 **Self-focusing in SF_6.** Ackerhalt, J.R.; Galbraith, H.W. (Los Alamos National Lab., NM). *Proceedings of the Society of Photo-Optical Instrumentation Engineers;* **288**: 223-228(1981).

It is shown by explicit calculation of the previously published quasicontinuum model that the molecular susceptibility rapidly approaches zero as higher excited states of the molecule become populated. Hence the overtones of the nu$_3$-pumped mode are totally responsible for the self focusing effects in SF_6. The nu$_3$ ladder contribution to the susceptibility is calculated. The vibrational model is a classical triply degenerate anharmonic oscillator in the Cartesian basis with the anharmonicity parameters chosen to be consistent with the latest spectroscopic anlaysis of the 3nu$_3$ overtone spectrum. The rotational structure is represented by a distribution of these oscillators where the distribution is chosen to correspond to the spectrum of the nu$_3$ fundamental. Good agreement is found with the 300K self-focusing data of Nowak and Ham at CO_2 P(28), P(20) and P(10) in SF_6.

22229 **Moment techniques in atomic and molecular scattering theory.** Reinhardt, W.P. (Univ. of Colorado, Boulder). pp 129-150 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

Moment techniques have recently been shown to be useful in ab initio calculation of atomic and molecular continuum processes. We illustrate these methods in a discussion of the photoeffect in hydrogen (H) and H$^-$, and in a discussion of e$^+$-H scattering. As further illustrations of the utility of moments in non-relativistic scattering we consider their use in extracting information from classical trajectory treatments of molecular collisions, and their phenomenological application in correlating experimental data via the information theory approach of Bernstein and Levine.

22230 **Stieltjes-Tchebycheff moment-theory approach to photoeffect studies in Hilbert space.** Langhoff, P.W. (Indiana Univ., Bloomington). pp 191-212 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

An outline is given of the so-called Stieltjes-Tchebycheff method for studies of photo cross sections in Hilbert space. This approach, based on recognition of the convergence of spectral moments of the cross section in an L^2 basis, has proved particularly useful in studies of molecular photo-effect, in which case the potentials are noncentral and nonlocal, and electronic wavefunction antisymmetry under permutation must be maintained. Moreover, moment-theory strategy has been adopted recently in nuclear photoeffect studies, and so a description of the Stieltjes-Tchebycheff formalism and related techniques seems appropriate at this time. The general theoretical development is presented. Illustrative applications, including photodissociation of the deutron, photoabsorption in atomic hydrogen and helium, and photodetachment in the hydrogen anion, are given. Polynomial-expansion and continued-fraction summation techniques for obtaining photo cross sections from Hilbert-space calculations are described and are contrasted and compared with the Stieltjes-Tchebycheff approach. (WHK)

22231 **Extended x-ray absorption fine structure (EXAFS): a novel probe for local structure of glassy solids.** Wong, J. (General Electric Corporate Research and Development, Schenectady, NY). *Proceedings of the Society of Photo-Optical Instrumentation Engineers;* **204**: 44-52(1979). Contract AC02-79ER10382.

The extended x-ray absorption fine structure (EXAFS) is the oscillation in the absorption coefficient extending a few hundred eVs on the high energy side of an x-ray absorption edge. This mode of spectroscopy has recently been realized to be a powerful tool in probing the local atomic structure of all states of matter, particularly with the advent of intense synchrotron radiation. More importantly is the unique ability of EXAFS to probe the structure and dynamics around individual atomic species in a multi-atomic system. In this paper, the physical processes associated with the EXAFS phenomenon will be discussed. Experimental results obtained at the Stanford Synchrotron Radiation Laboratory on some oxide and metallic glasses will be presented. The local structure in these materials are elucidated using a Fourier transform technique.

22232 **(AD-A—118074/4) A variational approach to the Rayleigh-Taylor instability of an accelerating plasma slab. Master's thesis.** Targove, J.D. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Dec 1981. 81p. NTIS, PC A05/MF A01.

The growth rate of the hydromagnetic Rayleigh-Taylor instability is approximated here for an accelerating plasma slab. The slab is chosen as a large-radius approximation to an imploding cylindrical foil. A normal mode solution of the MHD equations is assumed, resulting in an integral relation for the instability growth rate. The Rayleigh-Ritz variational method is applied to the relation to estimate the growth rate. A linearly decreasing magnetic field is assumed in the slab perpendicular to the acceleration. A corresponding equilibrium mass density profile is then found. Growth rate estimates are then made for these profiles. Calculations are made for perturbation wavevectors perpendicular to the acceleration and at an angle theta to the magnetic field. The growth rates for theta = 90 degrees compare favorably with LeLevier et al's results for a continuous density transition (14). Growth rates for theta = 0 degrees are stable for all perturbation wavelengths and magnetic field strengths. This contradicts prior results in both slab and cylindrical geometry and suggests an error in this work.

22233 **(SFB—80/T/211) Calculation of curved shear layers with two-equation turbulence models.** Rodi, W.; Scheuerer, G. (Karlsruhe Univ. (T.H.) (Germany, F.R.). Sonderforschungsbereich Ausbreitungs- und Transportvorgaenge in Stroemungen). Jul 1982. 48p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE83750303.

With 32 refs., 14 figs.

Three extensions of the k-epsilon turbulence model were tested for shear-layer flows with streamline curvature. The first version is an algebraic stress model which was derived by simplification of modelled Reynolds stress equations and does not contain curvature-specific empiricism. The other two versions use modified form of the dissipation rate equation. The test cases considered are a convexly curved boundary layer, a curved mixing layer and wall jets on logarithmic spiral surfaces. The results show that the algebraic stress model gives the best overall agreement in the curved part of the flow but predicts too fast a recovery after the removal of curvature.

22234 **(UCRL—88560) Particle-dynamics calculations of shear flow.** Walton, O.R. (Lawrence Livermore National Lab., CA (USA)). Aug 1982. Contract W-7405-ENG-48. 13p. (CONF-820843—3). NTIS, PC A02/MF A01. Order Number DE83005446.

From US-Japan seminar on new models and constitutive relations in the mechanics of granular materials; Ithaca, NY, USA (22 Aug 1982).

Two-dimensional discrete particle computer models similar to those of P. Cundall are described. The soft-particle approach used in these models allows them to be applied over a wide range of conditions from static situations through rapid shear conditions. Surface friction between particles and with boundary walls is explicitly modeled. Particular attention is paid to the modeling of dynamic situations wherein the energy losses and momentum transfer during inter-particulate collisions play important roles. Comparisons with analytic solutions have verified the numerical techniques and direct comparison with physical tests involving several particles have verified the models' ability to calculate the motion of real materials. Direct shear tests on oil shale rubble and corresponding calculations indicate qualitatively similar circulation phenomena and both showed large fluctuations in the magnitude of the shearing force. Incline chute flow calculations are providing detailed descriptions of individual particle paths in which shearing and size segregation phenomena can be observed. Initial comparisons with experiments indicate somewhat slower segregation in two-dimensional calculations than in experiments with spherical particles. 5 figures.

22235 **Dielectric effects on the spectra of condensed phases.** Warner, J.W.; Wolfsberg, M. (Chemistry Department, University of California, Irvine, California 92717). *Journal of Chemical Physics;* **78**: No. 4, 1722-1730(15 Feb 1983).

The single-resonance damped oscillator model for molecular polarizability is combined with the Lorentz model for the local field in order to obtain expressions describing the dielectric constant and absorption coefficient of pure condensed phases. These expressions are functions of three parameters: the transition dipole matrix element, the molecular resonance frequency, and the lifetime. It is found that condensed phases exhibit a macroscopic resonance frequency different from the molecular resonance frequency, and equations are supplied whereby one may calculate this shift. The shape of the condensed phase absorption coefficient is found to be unsymmetrical about the resonance frequency for intense bands; a method is described in which one exploits this lack of symmetry in order to find the transition dipole matrix element. Attenuated total reflection data for four liquid phase infrared bands are analyzed in terms of the absorption model.

22236 **Rayleigh—Taylor instability with spatially varying acceleration: an illustration.** Baker, L. (Mission Research Corporation, Albuquerque, New Mexico 87106). *Physics of Fluids;* **26**: No. 2, 391-392(Feb 1983). Contract AC04-76DP00789.

An illustrative but realistic case of Taylor instability in an atmosphere in which the density increases exponentially with height and the gravitational acceleration varies with height, $g(z) = g_1 + g_2$ exp(+- k/sub g/z), is considered. This model problem is of interest both in astrophysical contexts (e.g., an extended accretion disk) and magnetically accelerated configurations in which the field may diffuse into the material being accelerated. Both bounded and unbounded atmospheres are considered. For the case $g = g_0$ exp(-k/sub g/z), the growth rate is reduced compared to the case with constant $g = g_1 = g_0$ exp(-k/sub g/z/sub m/), where z/sub m/ is the height of the maximum of the velocity eigenfunction, by more than would be expected.

22237 **Two models of truncated Navier—Stokes equations on a two-dimensional torus.** Franceschini, V. (Los Alamos National Laboratory, Center for Nonlinear Studies, MS 258, Los Alamos, New Mexico 87545). *Physics of Fluids;* **26**: No. 2, 433-447(Feb 1983).

Two truncations of the Navier—Stokes equations for an incompressible fluid on a two-dimensional torus are numerically investigated. The two models, an eight-mode truncation and a nine-mode extension of it, exhibit almost completely different behaviors. Only two aspects appear to be common to both. First, in contrast to all the previously studied models, turbulence takes place at low Reynolds numbers and for critical values close to each other. Second, there is a parameter interval for which the same stable periodic orbit is present in both models. The main feature of the two truncations is a very rich phenomenology, with many different bifurcations of closed orbits. Turbulence is reached through a sequence of period-doubling bifurcations in the eight-mode model, and via a tangent bifurcation in the nine-mode one. Sequences of infinite bifurcations, the presence in a very narrow range of a stable closed orbit with a quite long period, a homoclinic bifurcation, and the coexistence of strange attractors with attracting periodic orbits, appear to be the more interesting phenomena.

22238 Effect of compressibility on the Rayleigh—Taylor instability. Bernstein, I.B.; Book, D.L. (Berkeley Research Associates, Springfield, Virginia 22150). *Physics of Fluids;* **26**: No. 2, 453-458(Feb 1983).

Eigenfrequencies are calculated for infinitesimal perturbations of the system consisting of two semi-infinite regions, each filled with a constant-temperature ideal polytrope stratified exponentially against gravity. The linear growth rate for the Rayleigh—Taylor instability which occurs when the density above the interface exceeds that below it is shown in the model to vary linearly with wavenumber k as k→0. The incompressible fluid result is obtained when the adiabatic index γ approaches ∞. For finite γ (i.e., compressible fluids), the growth rates are in general larger than in the incompressible case. Numerical results and limiting cases are described which illustrate this conclusion.

22239 Exact solutions to the renormalization-group fixed-point functions for intermittency in two-dimensional maps. Hu, B.; Rudnick, J. (Department of Physics, Brookhaven National Laboratory, Upton, New York 11973). *Physical Review [Section] A: General Physics;* **26**: No. 5, 3035-3036(Nov 1982). Contract AC02-76CH00016.

Using a differential-equation formulation, we have found the exact solutions to the fixed-point functions of the renormalization-group equations for intermittency based on a class of two-dimensional area-preserving maps.

22240 Rayleigh-Taylor instabilities in stratified fluids. Mikaelian, K.O. (University of California, Lawrence Livermore National Laboratory, Livermore, California 94550). *Physical Review [Section] A: General Physics;* **26**: No. 4, 2140-2158(Oct 1982). Contract W-7405-ENG-48.

We study the growth of Rayleigh-Taylor instabilities at the interfaces of any number N of stratified fluids forming an arbitrary density profile. Using the linear theory, we show that there are 2(N-1) exponential growth rates which can be found by calculating the eigenvalues of an (N-1) x (N-1) band matrix. We illustrate analytically the case N = 3. For general N we state and outline the proofs of two theorems: the first refers to the invariance of the spectrum of growth modes under inversion (rho/sub i/→1/rho/sub N+1-i/, t/sub i/→t/sub N+1-i/), and the second relates the spectrum of any inversion-invariant density profile having free boundaries to the spectrum of the same profile between fixed boundaries. We compare and illustrate the results of our numerical code with the case of a continuous density profile rho = rho$_0$e/sup betay/, and, setting N = 12, we apply our technique to solving a particular problem in designing a multishell target for inertial confinement fusion.

22241 Numerical simulations of magnetohydrodynamic chemically reactive flows in three dimensions on a vector computer. Hain, K.; Hain, G. (Naval Research Lab., Washington, DC (USA). Plasma Physics Div.). *Computer Physics Communications;* **27**: No. 4, 325-333(Oct 1982).

Extensive simulations of chemically reactive magnetohydrodynamic flows have been performed at the Naval Research Laboratory. The paper discusses briefly the numerical scheme and the use of virtual disc storage. It shows how the data flow for the computation of chemical reactions is organized to achieve an optimal computing speed. As an example the plasma flow around the earth is simulated. The results show a detailed structure, therefore demonstrating the almost complete lack of diffusion.

22242 Microscopic theory of intrinsic shear and bulk viscosities. Sung, W. (State Univ. of New York, Stony Brook); Karkheck, J.; Stell, G. *Journal of Statistical Physics;* **27**: No. 3, 513-532(1982).

A microscopic theory of intrinsic shear and bulk viscosities of solutions is given for a model of particles that interact with hard-sphere cores and weak long-range attraction. The approximation considered (the velocity chaos assumption of the Enskog theory) can be expected to yield quantitatively useful values for viscosities of the model solute-solvent system when the solute particles are not much larger than the solvent particles. Under solute-solvent mixing conditions of constant pressure and temperature, it is found that the intrinsic viscosities of a hard-sphere solute in a hard-sphere solvent can be positive or negative, depending upon size and mass ratios; for solute and solvent particles whose mass ratio equals their volume ratio, the intrinsic shear and bulk viscosities are always positive for solute particles larger than solvent particles: in the opposite case, the intrinsic shear viscosity is always negative while the intrinsic bulk viscosity is for the most part negative, becoming positive again when the solute particle is sufficiently small. For solute particles smaller than solvent particles, this result is sensitive to change in mass ratio. The addition of solvent-solvent attraction is found to lower the intrinsic viscosities substantially; the addition of solute-solvent attraction raises it. Detailed quantitative analysis of these effects is given.

22243 Non-uniform fluids. Percus, J.K. (New York Univ., NY). pp 31-140 of Liquid state of matter: fluids, simple and complex. Montroll, E.W.; Lebowitz, J.L. (eds.). Amersterdam, Netherlands; North-Holland Publishing Co. (1982). Contract AC02-76ER03077.

A brief review of the ideal gas in an external field is given in order to introduce local therodynamics. Next, the bulk properties of three-dimensional fluids are described in terms of the principal classes of approximations in current use: mean field theory, integral equations obtained by functional expansion, dynamical approximation methods, distribution function hierarchies and their truncations, and perturbation methods. Then, an analysis of nonuniform simple fluids is given in the general format of linear response theory. The emphasis then shifts to the two-phase interface and to techniques of which local thermodynamics is progenitor. (SC)

6450 High Energy Physics

REFER ALSO TO CITATION(S) 21522, 21524, 22345

22244 (DOE/ER/03023—31) High-energy physics at Tufts University. Final report. (Tufts Univ., Medford, MA (USA)). 31 Dec 1982. Contract AC02-76ER03023. 27p. NTIS, PC A03/MF A01. Order Number DE83007503.

This Final Report summarizes research accomplished at Tufts University in High Energy Physics during the period 1957 to 1982, with emphasis on the period since 1979 when next previous such summary report was submitted. Activities and publications up to 31 December 1982 and not earlier reported are listed. Principal accomplishments during the past six years include: measurement of the near equality of the charmed D^0 and D^{+-} lifetimes; determination of important features of nu/sub μ/ cross sections on nucleons, of majority quark momentum distributions, of charmed Λ/sub c/$^+$ production and decay of quark and di-quark fragmentation, and of Z^0 left-handed couplings to u- and d-quarks; the second observation of the upsilon particle; the hadronic production of the J/psi particle via the chi charmonium state; observation of virtual-photon shadowing in deep-inelastic muon scattering; and observation of evidence for two new scalar meson states. In theoretical work, a detailed understanding of the nature of optimal representations of amplitudes and observables in scattering processes has been achieved.

22245 (DOE/ER/03533—1) Research program in elementary particle theory. Progress report for the period ending June 30, 1983. (Syracuse Univ., NY (USA)). 1983. Contract AC02-76ER03533. 47p. NTIS, PC A03/MF A01. Order Number DE83007601.

The Syracuse High-Energy Theory group has contributed significantly to many of the current areas of active research in particle physics. Multigenerational grand unified theories have been explored in depth and the predictions of grand unified theories for proton decay have been critically examined. The properties of magnetic monopoles predicted by such theories have been studied. Topological solutions predicted by chiral and other phenomenologically interesting models have been studied. Various properties of glueballs have been explored using the effective Lagrangian approach. Now results of neutrinoless double beta decay in lepton-number-violating gauge theories were found. Aspects of galaxy formation, the nature of phase transitions in general field theories, and properties of supersymmetric theories have been explored. Progress has also been made in the formulation of relativistic particle dynamics. Publications are listed.

22246 (FERMILAB-CONF—82/36-THY) **Future accelerators and their contributions.** Bjorken, J.D. (Fermi National Accelerator Lab., Batavia, IL (USA)). May 1982. Contract AC02-76CH03000. 21p. (CONF-820165—1). NTIS, PC A02/MF A01. Order Number DE83006478.

From Pan American symposium on HEP and technology; Cocoyoc, Mexico (4 Jan 1982).

Future directions to be taken in the development of high energy accelerators to provide the most valuable physics research are discussed. Some projections are made about physics areas to be studied. The nominal order of magnitude for most processes of interest are, at the energy scale of 100 to 1000 TeV, of order 10^{-35} cm^2. Luminosity is important. (GHT)

22247 (LA—9572-C-Vol.1, pp 245-249) **Low energy frontier.** Glashow, S.L. (Harvard Univ., Cambridge, MA). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

Nineteen areas of study are proposed. They are: electric dipole moments of the neutron and of the electron; the magnetic dipole moments of baryons; precision studies of CP violation in K^0 decay; the search for rare decay modes; the study of double beta decay; neutron-antineutron oscillations; proton decay; magnetic monopoles; the mass of the electron neutrino; neutrino oscillations; solar neutrinos; solar antineutrinos; superheavy isotopes; fractional electric charge; medium energy hadron spectroscopy; axions; precision cosmic ray physics; galactic neutrinos or photinos and uv astronomy; and medium energy meson-nucleus scattering and heavy ion collisions. (GHT)

22248 (LA—9572-C-Vol.1, pp 367-390) **Possibilities for nuclear physics studies at LAMPF II.** Seth, K.K. (Northwestern Univ., Evanston, IL). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

This discussion covers muon beams, positron beams, photon beams, pion beams, deep hole states in nuclei, pion condensates in nuclei, pion-nucleon resonances, pion-pion interactions, pion resonances, proton beams, high momentum components and non-nucleonic degrees of freedom, and the quark interface. (GHT)

22249 (BNL—51602) **An e-p primer.** White, D.H. (Brookhaven National Lab., Upton, NY (USA)). 15 Oct 1982. Contract AC02-76CH00016. 25p. NTIS, PC A02/MF A01. Order Number DE83008470.

The basic formulas for kinematics and calculating yields of events for an e-p collider are presented, together with typical results.

22250 (DOE/ER/01195—474) **High-energy photoproduction of rho and phi vector mesons.** Callahan, P.H. (Illinois Univ., Urbana (USA)). 1983. Contract AC02-76ER01195. 216p. (COO—1195-474). NTIS, PC A10/MF A01. Order Number DE83007418.

We have studied the photoproduction of rho and phi vector mesons from hydrogen in the Fermilab broad band neutral beam. Forward going two particle final states were detected in a multiparticle spectrometer consisting of two analyzing magnets, a multiwire-proportional-chamber tracking system and a particle identification system. Recoil protons and target fragments were observed in a recoil detector which surrounded the target. The total elastic cross-sections were measured to be independent of energy at the 10% level from 35 to 225 GeV at 10.6 μb for the rho and from 35 to 165 GeV at 0.64 μb for the phi. The elastic differential cross-sections were also measured. Approximately 20% of the diffractive rho and phi events were found to be inelastic from an analysis of the recoil detector. The t-dependence of the fraction of diffractive events which are inelastic for both the phi and the psi are consistent with a universal function determined from the rho data.

22251 (DOE/ER/01195—479) **eP physics at the CBA.** Wiss, J.E.; White, D.H.; Morse, W.M. (Illinois Univ., Urbana (USA). Dept. of Physics; Brookhaven National Lab., Upton, NY (USA)). 1982. Contract AC02-76ER01195. 38p. (COO—1195-479). NTIS, PC A03/MF A01. Order Number DE83007419.

In this report we have tried to demonstrate how a 20 x 400 GeV eP facility at the CBA will complement the future physics of high energy $e+e^-$ and hadron-hadron colliders. By offering the first glimpse of the physics of 17 TeV muon and neutrino beams, an eP collider will extend tests of the standard model by about an order of magnitude in spacelike momentum transfer, and thus close the final kinematic gap of knowledge about electro-weak processes. It will be especially interesting to test whether the lefthanded nature of the charged current observed at low spacelike momentum transfers persists to large, spacelike momentum transfers. A high energy eP collider also enables unique tests of QCD such as a study of high Q^2 scale breaking and the high P/sub t/ QCD Compton process. In addition to probing small distance behavior in kinematic regions orthogonal to other collider facilities, an eP facility will generate data useful to understanding the physics of $e+e^-$ and hadron-hadron collisions. The current jet produced in the high energy eP neutral current process is produced against a single electron which can be used to predict the momentum of the quark which gives rise to the jet. Hence the central problem in jet physics of deducing the kinematics of a quark by measurement of its hadronization jet can be studied under uniquely controlled circumstances. Finally the high Q^2 structure functions of the proton which are essential in understanding hard process in hadron-hadron scattering can only be cleanly measured in an eP collider.

22252 (DOE/ER/03244—102) **Experimental medium-energy physics at Carnegie-Mellon University, 1968-1983.** (Carnegie-Mellon Univ., Pittsburgh, PA (USA)). Jan 1983. Contract AC02-76ER03244. 238p. (COO—3244-102). NTIS, PC A11/MF A01. Order Number DE83008136.

Past, present, and future activities are described. The major portion of the current research effort is directed toward studies on the weak decay of Λ-hypernuclei, the anti pp → anti ΛΛ reaction at threshold using LEAR, and mechanisms for pion annihilation in light nuclei. Experimental proposals at user facilities are summarized, publications are listed, and recent preprints are included. (WHK)

22253 (FERMILAB-CONF—82/25-EXP) **Charm and beauty photoproduction at Fermilab.** Appel, J.A. (Fermi National Accelerator Lab., Batavia, IL (USA)). Apr 1982. Contract AC02-76CH03000. 26p. (CONF-811195—6). NTIS, PC A03. Order Number DE82012930.

From Europhysics conference on the search for charm, beauty and truth at high energy; Erice, Italy (15 Nov 1981).

Four manifestations of charm have been observed in photoproduction at Fermilab so far. These four are: (1) multimuon indications of the total charm cross section and observations of (2) psi and psi′, (3) D^0 and D* and (4) Λ/sub c/. The relevant photoproduction experiments in the search for charm at Fermilab are the broad band neutral beam experiments by a Columbia-Fermilab-Illinois (CFI) collaboration, the Tagged Photon Beam experiment by the TPS collaboration and the muon beam experiment with an active iron target by the Berkeley-Fermilab-Princeton (BFP) collaboration.

22254 (FERMILAB-Conf—83/13-EXP) **Comparison of dimuon production by 125 GeV/c anti p and πp with predictions of the Drell-Yan model.** Cox, B. (Fermi National Accelerator Lab., Batavia, IL (USA)). Jan 1983. Contract AC02-76CH03000. 10p. (CONF-8210107—2). NTIS, PC A02/MF A01. Order Number DE83007136.

From Workshop on Drell-Yan processes; Batavia, IL, USA (7 Oct 1982).

The measurements of dimuon production ($M >$ GeV/c^2) by 125 GeV/c anti p and π^- performed by Fermilab Experiment 537 are compared to the predictions of the Drell-Yan model in this report. We find that the naive Drell-Yan cross sections calculated using CDHS and NA3 structure functions are too low by factors of 2.25 +- 0.45 and 2.50 +- 0.50 to reproduce the levels of our anti p and π^- cross sections respectively. The shapes of the dσ/dx/sub F/ and M^3 dσ/dM differential cross sections are well reproduced by the naive zeroth order formula. The shape of the dσ/dp/sub T/ cross section for the dimuons as measured by E-537 can be fit using the Alterelli, Parisi, and Petronzio O(α/sub s/) prescription for calculating P/sub T/ distributions but requires $<$ k/sub T/^{2} $>$ of the interacting constituents of the nucleons and pion of 0.88 (GeV/c)^2. This $<$ k/sub T/^{2} $>$ is larger than the $<$k/sub T/^{2} $>$/sub π/ = 0.59 +- 0.05 (GeV/c)^2 and $<$ k/sub T/^{2}$>$/sub P/ = 0.52 +- 0.05 (GeV/c)^2 obtained from the linear extrapolations of the s variation of the $<$ P/sub T/^{2}$>$ of the experimentally observed dσ/dp/sub T/ distributions to s-O. This implies that first order QCD in the formalism of Altarelli, Parisi, and Petronzio is insufficient to explain $<$ P/sub T/^{2} $>$ of the data.

22255 (INIS-mf—7432, pp vp) **Proposed experiment to study the dissociation process n$\rightarrow\Lambda^0K^0$.** Nemecek, S.; Novak, M. (Ceskoslovenska Akademie Ved, Prague. Fyzikalni Ustav:. [nd]. (In Czech). NTIS (US Sales Only), PC A06/MF A01.

From 6. conference of Czechoslovak physicists; Ostrava, Czechoslovakia (27 Aug 1979).

22256 (LA—9572-C-Vol.2, pp 409-412) **Muon working group report.** Heffner, R.H. (Los Alamos National Lab., NM). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

A brief summary of the working group study is given. Topics touched on by the group include: reviews of the estimated muon fluxes for stopping muon beams at LAMPF II and at the PSR; pulsed muon beams at the PSR (Proton Storage Ring); the possibility of a new muon g-2 experiment at LAMPF II; undetected parity violating decays in muonic atoms; measurement of auger electrons emitted from high lying transitions in muonic atoms carried out at SIN; muon capture; muon-minus induced fission; and the use of a macroscopic timing technique to measure time-differential muon decay spectra. (GHT)

22257 (LA—9572-C-Vol.2, pp 413-421) **Search for exotics in two-body decay of K^+: K/sub $\mu/_2$ and K/sub $\pi/_2$ revisited.** Yamazaki, T. (Univ. of Tokyo, Japan). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

A new light is shedded on K/sub $\mu/_2$ and K/sub $\pi/_2$ decays of K^+ in view of possible existence of heavy neutrinos and Higgs particles, which could be revealed in high-resolution spectroscopy in a wide momentum range. A recent experiment done at KEK is described and future perspectives are given.

22258 (LA—9572-C-Vol.2, pp 428-439) **Application of positive K mesons in solid-state physics: requirements and perspectives.** Seeger, A. (Max-Planck-Institut fuer Metallforschung, Stuttgart, Germany). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

Future kaon factories will permit experiments based on the lattice steering (channelling) of the positive muons (μ^+) produced by the decay of positive kaons (K^+) implanted into highly perfect crystals. The requirements for and the potential of such K^+/μ^+ lattice-steering experiments are discussed. It is concluded that with beams of about 10^7 K^+/s at momentum p/sub K/ = 550 MeV/c or of about 10^8 K^+/s at p/sub K/ = GeV/c such experiments are very promising and a valuable supplement to the π^+/μ^+ lattice-steering experiments.

22259 (LA—9572-C-Vol.2, pp 440-463) **Muon capture reaction (μ^-,nu/sub μ/) with nuclei.** Walecka, J.D. (Stanford Univ., CA). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

A pulsed source fo stopped μ^- and experimental muon facility associated with the Pulsed Storage Ring (PSR) under construction at LAMPF is a distinct possibility. With a new superconducting solonoid muon channel, one could expect negative muon fluxes at the PSR to match or exceed those at the present LAMPF Stopped Muon Channel (SMC). The time structure of the beam opens a whole new range of experimental possibilities in nuclear muon capture. With LAMPF II, the μ^- flux could exceed that at SMC by up to two orders of magnitude. With the possibilities of these greatly improved and more versatile μ^- beams, it seems appropriate to reexamine the subject of muon capture on nuclei. The purpose of this contribution is to give an overview response to the question what can be learned from the muon capture reaction (μ^-,nu/sub μ/) on nuclei.

22260 (LA—9572-C-Vol.2, pp 464-466) **Rare decay and hyperons.** Mischke, R.E. (Los Alamos National Lab., NM). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

The working group on Rare Decays and Hyperons considered several topics of potential interest for LAMPF II. Presentations were made by several persons and much discussion followed. My impression of our conclusion is that while the arguments for a next generation of rare K decay experiments are strong and the need for LAMPF II obvious, the situation for hyperon physics is less clear. Since some hyperon experiments can best be done at FNAL or the SPS, it will require detailed design to determine the class of experiments for which LAMPF II excels.

22261 (LA—9572-C-Vol.2, pp 467-489) **Experimental study of the electromagnetic decays of the Λ and Σ excited states.** Hynes, M.V. (Los Alamos National Lab., NM). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

Electromagnetic decays have served as bench marks in the developing stages of the shell model in nuclei. The quark confinement pictures for baryons are now in a similar developing stage. This experiment will test in an unambiguous way, the configurations present in the low lying excited states of the Λ and Σ by measuring the electromagnetic branching ratios that connect them. Experimentally, about half of the decays should be measured at FNAL using the hyperon beam via the Primakoff effect. The remaining transitions, including the very interesting forbidden ones, will require the K fluxes and purities available at LAMPF II.

22262 (LA—9572-C-Vol.2, pp 490-536) **Measurement of the rare decay $K^+ \rightarrow \pi^+$ nu anti nu.** Ferro-Luzzi, M. (CERN, Geneva, Switzerland). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

This is an abridged version of the CERN proposal CERN/PSCC 82-24; the specific issues relevant to a possible performance of the experiment at CERN have been omitted. This experiment, although feasible with present beams and present accelerators, would benefit considerably from the larger intensities planned for machines of the type of LAMPF II. In particular, the higher flux of K mesons could be exploited, not so much to increase the statistics or to reduce the running time, but to perform a better K/π separation. This would decrease the background and the accidental rates which at present are the real limiting factors of the proposed measurement.

22263 (LA—9572-C-Vol.2, pp 538-541) **LAMPF II neutrino working group.** Carlini, R. (Los Alamos National Laboratory, NM). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

The neutrino working group addressed five general topics of interest to the neutrino community. These were nu/sub μ/e scattering, nu/sub e/e scattering, nu oscillation, nu/sub μ/P scattering and neutrino-nuclear reactions.

22264 (LA—9572-C-Vol.2, pp 560-583) **Neutrino interactions with nuclei.** Walecka, J.D. (Stanford Univ., CA). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

In this brief contribution we concentrate on giving an overview response to the question what can be learned from neutrino reactions with nuclear targets. We start with the most sophisticated and experimentally most complex topic, yet in a certain sense it is also the simplest and cleanest. We examine tests of the Standard Theory of Electro-Weak Interactions. The tests are model-independent in the sense that they are relations between experimental quantities which are direct consequences of the WSG theory, but they are independent of the detailed structure of the nucleus. Such relationships were anticipated by Weinberg. Some general considerations are given on neutrino reactions with nuclei, focusing largely on charged-lepton production. We demonstrate that Intermediate-energy neutrino reactions have a central and unique role to play in our understanding of semi-leptonic weak interactions and illustrate this point by discussing a complete kinematic experiment on the nucleon.

22265 (LA—9572-C-Vol.2, pp 584-592) **Neutrino oscillation searches at CERN.** Vannucci, F. (LPHNE, Paris, France). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

Various neutrino oscillation projects which have been put forth at CERN are discussed. Three proposals use the present detectors: BEBC, CDHS, and CHARM. They require a new low-energy neutrino beam, which is being constructed. One proposal uses the present high-energy SPS beam. It requires a new fine-grain detector. Approval of this experiment is still pending. There are two methods of measuring oscillations. The disappearance method measures the flux of a given neutrino (in our case nu/sub μ/ as a function of the distance R from the production target. Without oscillation the flux decreases as $1/R^2$; with oscillation it decreases faster. In the appearance method a new species of neutrino is searched for, for instance nu/sub e/ in a pure nu/sub μ/ initial beam. For experimental reasons, CDHS and CHARM use the disappearance method between two detectors positioned at two different distances, while BEBC chooses the appearance method, at a fixed distance. The high-energy experiment proposes to use the two methods simultaneously, thus having extra control over possible sources if an effect is found.

22266 (LA—9572-C-Vol.2, pp 602-604) **Possibility of observing nu p elastic scattering in a hydrogen bubble chamber at LAMPF II.** Hoffman, C.M. (Los Alamos National Lab., NM). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

There is great interest in accurately measuring nu/sub μ/p elastic scattering (and anti nu/sub μ/p elastic scattering). These reactions proceed through the weak neutral current (WNC). An accurate measurement of the cross sections would provide a detailed test of the Weinberg-Salam model. The present world's supply of events totals ~ 300 nu/sub μ/p and ~ 150 anti nu/sub μ/p events with $q^2 \geqq 0.3$ $(GeV/c)^2$. Existing and proposed measurements are plagued by large backgrounds and systematic uncertainties. Extending the measurements to lower q^2 would be the most accurate determination of the space-time structure of the WNC. The experimental difficulty in achieving an accurate measurement of the elastic scattering cross secction is primarily the poor event signature. All one can detect is the low energy recoil proton. The kinematic energy of the proton is related to q^2 by q^2 = 2m/sub p/T/sub p/. Thus measuring at lower q^2 implies measuring lower energy recoil protons. The problem is compounded for protons bound in nuclei. The Fermi momentum of the initial state proton and the nuclear binding energies distort the observed q^2 spectrum. A detector which completely avoids these problems is a hydrogen bubble chamber as all of the protons are free. In addition, the correction due to nu n → nu n events where the neutron charge exchanges is not present. In past experiments this has been a large correction (20 to 30%). Finally, a hydrogen bubble chamber is an ideal detector for neutrino-proton elastic scattering as it is, in essence, the ultimate fine-grained instrument to observe low energy recoil protons.

22267 (LA—9572-C-Vol.2, pp 643-647) **Hadronic atoms at a kaon factory.** Leon, M. (Los Alamos National Lab., NM). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

Beyond doubt, the advent of a kaon factory will be of immense significance for the study of hadronic atoms. Here we will discuss some classes of experiments that certainly can and will be done at a kaon factory, as well as some very interesting possibilities which deserve investigation. Among the certains we include the observation of hadronic x rays from kaonic and Σ^- atoms, for both Z greater than one and for the isotopes of hydrogen, mainly for strong interaction information. More conjectural is the possibility of measuring Xi$^-$ and Ω^- x rays.

22268 (LBL—15469) **Expectations for old and new physics at high energy colliders.** Cahn, R.N. (Lawrence Berkeley Lab., CA (USA); European Organization for Nuclear Research, Geneva (Switzerland)). Dec 1982. Contract AC03-76SF00098. 46p. (CONF-820897—1). NTIS, PC A03/MF A01. Order Number DE83006968.

From Conference on physics at very high energy; Stanford, CA, USA (16 Aug 1982).

During the past year, the first data from the SPS collider at CERN have become available. The initial results are only a glimpse at a new energy regime and we can reasonably expect an increase in the extent of the data by a factor of 10^4 to 10^5. Moreover, within a few years, the Fermilab Tevatron Collider will be in operation with a center of mass energy nearly four times as great as that at CERN. Beyond these machines are other possibilities: a high luminosity pp machine at Brookhaven with a center of mass energy of 0.8 TeV; a p anti p or pp machine in the LEP tunnel at CERN; a desetron in the southwestern United States with many TeV in the center of mass. The purpose of these lectures is to provide an orientation for the wealth of data that these machines will provide.

22269 (NP—391355) **Hadron production in πi p, K^+ p and pp collisions at 147 GeV/c and properties of jet-like multiparticle systems.** (Istituto Nazionale di Fisica Nucleare, Pavia (Italy)). Jan 1981. 32p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83901355.

The gross features of the data are reviewed and the momentum tensor components, <S>, and <T> are studied. Evidence for coplanarity effects is observed. A probabilistic method to search for jets is proposed. The jets found by this method are found to be similar to high P/sub T/ jets from pp interactions, e^+e^- annihilations and γ/sub p/ interactions. The effect of subtracting the leading particles and the effect of low p/sub T/ diffractive and non diffractive components are investigated.

22270 (SLAC-PUB—2981) **First results from DELCO at PEP.** Atwood, W.B.; Baillon, P.H.; Barish, B.C. (California Inst. of Tech., Pasadena (USA); Stanford Linear Accelerator Center, CA (USA); Stanford Univ., CA (USA)). Oct 1982. Contract AC03-76SF00515. 7p. (CONF-820718—30). NTIS, PC A02/MF A01. Order Number DE83007005.

From 21. international conference on high energy physics; Paris, France (29 Jul 1982).

Preliminary results from DELCO are presented on several topics which utilize the particle identification capabilities of the detector: (1) we measure the Cabbibo angle in tau decays to be $\tan^2$ theta/sub c/ = 0.08 +- 0.03 +- 0.04; (2) in the intermediate x (p/E/sub BEAM/) range, $0.2 < x < 0.55$, the fraction of π^{+-} relative to all charged particles is found to be approximately 60% and to show only a weak energy dependence; and (3) we observe a large

D^{*+-} cross section ratio, R/sub D^{*+-}/ = $\sigma(e^+e^- \to D^{*+-}X)/\sigma$/ sub $\mu\mu$/ = 2.0 +- 0.6 +- 0.7 in the z (E/sub D^*//E/sub BEAM/) range above 0.3. In contrast with the lighter quarks, the fragmentation of charmed quarks occurs predominantly at large values of z; we measure <z> = 0.6 +- 0.1.

22271 **(SLAC-PUB—2982) Heavy-quark fragmentation fom e^+e^- annihilation and nu N scattering experiments.** Schlatter, D. (Stanford Linear Accelerator Center, CA (USA)). Sep 1982. Contract AC03-76SF00515. 17p. (CONF-820897—2). NTIS, PC A02/MF A01. Order Number DE83007004.

From Conference on physics at very high energy; Stanford, CA, USA (16 Aug 1982).

The review covers early results, recent results from nu N scattering experiments, charm production in e^+e^- at high energies, D^+ cross-section in e^+e^- annihilation, inclusive electrons in hadronic e^+e^- events, and inclusive hadron spectra and scale breaking in e^+e^- annihilation. 30 references, 18 figures. (GHT)

22272 **(SLAC-PUB—2988) Photon-photon collisions.** Burke, D.L.;. (Stanford Linear Accelerator Center, CA (USA)). Oct 1982. Contract AC03-76SF00515. 12p. (CONF-820718—29). NTIS, PC A02/MF A01. Order Number DE83007011.

From 21. international conference on high energy physics; Paris, France (29 Jul 1982).

Studies of photon-photon collisions are reviewed with particular emphasis on new results reported to this conference. These include results on light meson spectroscopy and deep inelastic $e\gamma$ scattering. Considerable work has now been accumulated on resonance production by $\gamma\gamma$ collisions. Preliminary high statistics studies of the photon structure function F_2/sup γ/(x,Q^2) are given and comments are made on the problems that remain to be solved.

22273 **(SLAC-PUB—2989) Review of e^+e^- physics at PEP - 1982.** Hollebeek, R. (Stanford Linear Accelerator Center, CA (USA)). Oct 1982. Contract AC03-76SF00515. 17p. (CONF-8208103—2). NTIS, PC A02/MF A01. Order Number DE83007063.

From 4. European symposium on anti NN and anti QQ interactions; Santiago de Compostella, Spain (30 Aug 1982).

Results obtained at PEP by the MARK II, MAC and DELCO collaborations in the past year are reviewed. They include QED tests, measurements of tau lepton properties, charm and bottom fragmentation functions, scaling violations, energy correlations and the total hadronic cross section.

22274 **(SLAC-PUB—3001) Particle searches in e^+e^- experiments at PEP and PETRA.** Lau, K.H. (Stanford Linear Accelerator Center, CA (USA)). Oct 1982. Contract AC03-76SF00515. 18p. (CONF-820897—3). NTIS, PC A02/MF A01. Order Number DE83007013.

From Conference on physics at very high energy; Stanford, CA, USA (16 Aug 1982).

This talk reviews recent results in new particle searches performed by experiments at the high energy e^+e^- storage rings PEP and PETRA. It concentrates on recent searches for: hadrons with a new quark flavor, spin-1/2 charged heavy leptons, spin-0 charged leptons, spin-0 point-like scalars or pseudoscalars, and neutral heavy leptons.

22275 **(SLAC-PUB—3005) New-particle spectroscopy, quarkonium and gluonic mesons.** Bloom, E.D. (Stanford Linear Accelerator Center, CA (USA)). Oct 1982. Contract AC03-76SF00515. 24p. (CONF-820718—27). NTIS, PC A02/MF A01. Order Number DE83007012.

From 21. international conference on high energy physics; Paris, France (29 Jul 1982).

Recent experimental results on quarkonium and gluonic mesons are presented and discussed. Comparisons with theory are made. Quarkonium predictions seem to agree well with experiment. The question of the experimental verification of gluonic mesons is clouded by the difficulty of the theoretical interpretation.

22276 **(SLAC-PUB—3017) Summary talk for the Brookhaven spin physics conference, 1982.** Prescott, C. (Stanford Linear Accelerator Center, CA (USA)). Nov 1982. Contract AC03-76SF00515. 9p. (CONF-820941—14). NTIS, PC A02/MF A01. Order Number DE83007025.

From 5. international symposium on high energy spin physics; Upton, NY, USA (16 Sep 1982).

I review the following highlights of this conference: polarized hyperon production, magnetic moments, symmetries, polarized ep physics, hadronic processes and QCD, and future prospects at colliders.

22277 **Observation of P-wave bb-bar bound states.** Han, K.; Boehringer, T.; Franzini, P. (Columbia University, New York, New York 10027). *Physical Review Letters;* **49**: No. 22, 1612-1616(29 Nov 1982).

The existence of P-wave bb-bar bound states chi/sub b//sup prime/ is demonstrated by observing photons from the transition Y''→γ+chi/sub b//sup prime/ in the inclusive photon spectrum from Y'' decays. The center of gravity of the observed photon energies is 98 MeV and the branching ratio for the transition of the Y'' to the chi/sub b//sup prime/ states if (34 +- 3)% (statistical).

22278 **Evidence for chi/sub b//sup prime/ production in the exclusive reaction Y''→γchi/sub b//sup prime/→($\gamma\gamma$Y' or $\gamma\gamma$Y).** Eigen, G.; Blanar, G.; Dietl, H. (Max-Planck-Institut fuer Physik, D-8000 Munich 40, Federal Republic of Germany). *Physical Review Letters;* **49**: No. 22, 1616-1619(29 Nov 1982).

Evidence is presented for the production of chi/sub b//sup prime/ states (2 ^{3}P) in the reaction Y''→γchi/sub b//sup prime/ →$\gamma\gamma$Y' (or $\gamma\gamma$Y) with subsequent decay of the Y' (Y) into e^+e^- or $\mu^+\mu^-$. The data were obtained with the nonmagnetic CUSB detector at the Cornell e^+e^- storage ring. Observed were 14 (15) events consistent with the transition to the Y' (Y) with an estimated background of 1.7 (1.3) events. The lower-energy photons cluster around 100 MeV, implying M(Y'')-M(chi/sub b//sup prime/)~100 MeV. A single line interpretation of the lower-energy photon spectrum is disfavored.

22279 **Reaction πp p→phiphin and evidence for glueballs.** Etkin, A.; Foley, K.J.; Longacre, R.S. (Brookhaven National Laboratory, Upton, New York 11973). *Physical Review Letters;* **49**: No. 22, 1620-1623(29 Nov 1982). Contract AC02-76CH00016;AC02-79ER10550.

The authors have detected 1203 events of the reaction π^-p→phiphin at 22 GeV/c, and have performed a partial-wave analysis of the phiphi system. The results are well represented by two resonances, both with quantum numbers I/sup G/ = 0^+, J/sup P/C = 2^{++}. The breakdown of the Okubo-Zweig-Iizuka suppression observed in this reaction is naturally explained in the context of QCD if these states are considered to be glueball candidates.

22280 **Radiative width of the A_2(1310).** Cihangir, S.; Berg, D.; Biel, J.; Chandlee, C.; Collick, B.; Droege, T.; Ferbel, T.; Heppelmann, S.; Huston, J.; Jensen, T. (Fermi National Accelerator Lab., Batavia, IL (USA). *Physics Letters, [Section] B;* **117**: No. 1/2, 119-122(4 Nov 1982).

Fermilab-Minnesota-Rochester Collaboration.

Using the Primakoff formalism, we have extracted the radiative decay width of the A_2^+(1310) produced in coherent interactions of 200 GeV/c π^+ mesons in nuclear targets. The width obtained is 295 +- 60 keV, a value consistent with quark-model predictions.

22281 **Radiative width of the Ksup(*+)(1430).** Cihangir, S.; Berg, D.; Biel, J.; Chandlee, C.; Collick, B.; Droege, T.; Ferbel, T.; Heppelmann, S.; Huston, J.; Jensen, T. (Fermi National Accelerator Lab., Batavia, IL (USA). *Physics Letters, [Section] B;* **117**: No. 1/2, 123-125(4 Nov 1982).

Fermilab-Minnesota-Rochester Collaboration.

Using the Primakoff formalism, we have extracted the radiative decay width of the Ksup(*)$^+$(1430) produced in coherent interactions of 200 GeV/c K^+ mesons in nuclear targets. The width obtained is 240 +- 45 keV, a value reasonably consistent with quark-model predictions.

22282 **Charmed-baryon production in $\nu D \rightarrow \mu^- \Lambda X$ reactions.** Son, D.; Snow, G.A.; Chang, C.Y. (University of Maryland, College Park, Maryland 20742). *Physical Review Letters;* **49**: No. 16, 1128-1131(18 Oct 1982).

Single Λ production with no other strange particles in the final state is observed in charged-current neutrino interactions in the deuterium-filled 15-ft bubble chamber at Fermilab. This phenomenon is interpreted as a signal for inclusive production of charmed baryons followed by Λ/sub c/$^+ \rightarrow \Lambda + X$ decays. The total Λ/sub c/$^+$ cross section times branching ratio for this process is found to be (2.0 +- 0.74 +- 0.65)% of the total charged-current neutrino cross section.

22283 **(DOE/ER/40008—29) QCD Monte-Carlo models for e^+e^- annihilations and hadron-hadron collisions.** Field, R.D.; Fox, G.C. (Florida Univ., Gainesville (USA). Dept. of Physics; California Inst. of Tech., Pasadena (USA)). 1982. Contract AS05-81ER40008. 64p. (CONF-820983—3). NTIS, PC A04/MF A01. Order Number DE83006482.

From Europhysics study conference on jet structure from quark and lepton interactions; Erice-Trapani-Sicily, Italy (12 Sep 1982).

QCD Monte-Carlo models for the production of parton and hadron showers in e^+e^- annihilations that do not rely on the limited transverse-momentum jet parameterization of Feynman and Field are examined and extended to hadron-hadron collisions. Evidence for gluon Bremsstrahlung effects in large p/sub T/ hadron-hadron collisions is presented, and recent data from CERN and Fermilab for both large- and small-aperture transverse-energy calorimeter triggers are discussed.

22284 **(FERMILAB-CONF—82/91-THY) Hadron jets in perspective.** Quigg, C. (Fermi National Accelerator Lab., Batavia, IL (USA)). Nov 1982. Contract AC02-76CH03000. 11p. (CONF-8209100—1). NTIS, PC A02/MF A01. Order Number DE83006644.

From Europhysics study conference on multibody phenomena in strong, electromagnetic, and weak interactions; Erice, Italy (11 Sep 1982).

The subject of hadron jet studies, to judge by the work presented at this workshop, is a maturing field which is still gathering steam. The very detailed work being done in lepton-lepton and lepton-hadron collisions, the second-generation measurements being carried out at Fermilab, the CERN SPS, and the ISR, and the very high energy hard scatterings being observed at the CERN Collider all show enormous promise for increased understanding. Perhaps we shall yet reach that long-sought nirvana in which high-p/sub perpendicular/ collisions become truly simple.

22293 (LA—9572-C-Vol.1, pp 115-135) **Rare decays of the K-meson.** Lubatti, H.J. (Univ. of Washington, Seattle). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

The motivation for studying rare decays of the K-meson such as K/sub L/$^0 \rightarrow \mu e$ and $K^{+-} \rightarrow \pi\mu e$ which do not conserve lepton-flavor and are therefore frobidden within the framework of the Standard Model is reviewed. Existing upper limits and new, proposed measurements of the branching ratios are discussed. The decay mode $K^{+-} \rightarrow \pi^{+-}$ + missing neutrals, is examined. The difficulty of relating this mode to the number of neutrino flavors and its importance for testing supersymmetric models and the Standard Model is emphasized. A discussion of some new ideas for detectors is included.

22294 (LA—9572-C-Vol.1, pp 171-179) **Quarks in nuclei.** Goldhaber, A.S. (State Univ. of New York, Stony Brook). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

There are certainly quarks in nuclei. Whether there are low energy nuclear effects described most simply in terms of quark configurations is not known. However, there remain to be tried many kinds of experiments which could bear on this question, including reactions which deposit energy and quantum numbers (but little momentum) in a nucleus. Doing these experiments will help to define the transition from quark to nucleon pictures, and thus to establish the foundation on which nuclear physics must rest.

22295 (LA—9572-C-Vol.1, pp 187-196) **Muon capture.** Deutsch, J. (Louvain Univ., Louvain-la-Neuve, Belgium). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

We discuss: time-reversal invariance, neutrino-mixing, the mass of nu/sub μ/, nu/sub μ/ helicity, the μ-nucleon coupling, renormalization of weak couplings in nuclei, and improvements required.

22296 (LA—9572-C-Vol.1, pp 197-201) **Comments on hadron spectra and electroweak couplings.** Karl, G. (Univ. of Guelph, Ontario). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

After a short introduction I comment on baryon magnetic moments, on the Ω^- electric quadrupole moment, on coupling constants for weak semileptonic decays and on the question of constituent gluons in baryons.

22297 (LA—9572-C-Vol.1, pp 202-220) **Nuclear response to p, anti p, π and K^{+-} projectiles up to a few GeV.** Walker, G.E. (Indiana Univ., Bloomington, IN). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

A more general overview contrasting opportunities and challenges that one can anticipate at higher energies for several projectiles is given. Later sections discuss each projectile (p,p,π and K^{+-}) separately but in order to set the stage for the later discussion the nuclear response at conventional intermediate energies is reviewed for protons and pions. A list of some of the basic parameters that might influence the nuclear response includes (a) the mean free path of the projectile in nuclear matter, (b) the relative strength of the projectile-nucleon amplitudes in various spin-isospin channels, (c) the resonance structure of the amplitudes (including elasticity and free resonance width), (d) the relative strength and free threshold for production of mesons and baryons not present in the incident channel, (e) the energy and momentum transfer delivered to the target.

22298 (LA—9572-C-Vol.1, pp 221-231) **Rare pion decays.** Bryman, D. (TRIUMF, Vancouver, British Columbia). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

The status and outlook for studies of some rare pion decays is discussed. Improved charged pion beams and tagged π^0 beams derived from an intense source of K/sub $\pi/_2$ decays will provide new opportunities for experiments at LAMPF II and the Kaon Factory.

22299 (LA—9572-C-Vol.1, pp 289-301) **Recent experimental results on Σ-hypernuclei.** Peng, J.C. (Los Alamos National Lab., NM). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

Recent experimental results on Σ-hypernuclei obtained at CERN are presented. Evidence of narrow states are reported in the (K^-,π^-) and the (K^-,π^+) reactions of ^{12}C and ^{16}O with kaon momentum of 400 and 450 MeV/c. A preliminary estimate of the isospin dependent potential and the spin-orbit potential for p-shell Σ-hypernuclei is made.

22300 (LA—9572-C-Vol.1, pp 362-366) **Brief look at N-nucleus physics at 1 to 16 GeV.** Moss, J.M. (Los Alamos National Lab., NM). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

I examine what is known about the N-N interaction in the energy range of 1 to 16 GeV, and what the implications are for N-nucleus physics. Additionally, some suggestions are made for areas of future experiments and what machine capabilities should be included for primary hadron beams.

22301 (SLAC—245) **Proceedings of Summer Institute of Particle Physics, July 27-August 7, 1981: the strong interactions.** Mosher, A. (ed.). (Stanford Linear Accelerator Center, CA (USA)). Jan 1982. Contract AC03-76SF00515. 714p. (CONF-810770—). NTIS, PC A99/MF A01. Order Number DE82012505.

From Summer institute on particle physics; Stanford, CA, USA (27 Jul 1981).

The ninth SLAC Summer Institute on Particle Physics was held in the period July 27 to August 7, 1981. The central topic was the strong interactions with the first seven days spent in a pedagogic mode and the last three in a topical conference. In addition to the morning lectures on experimental and theoretical aspects of the strong interactions, three were lectures on machine physics; this year it was electron-positron colliding beam machines, both storage rings and linear colliders. Twenty-three individual items from the meeting were prepared separately for the data base. (GHT)

22302 (SLAC-PUB—3003) **Testing GUTs: where do monopoles fit.** Ellis, J. (Stanford Linear Accelerator Center, CA (USA)). Oct 1982. Contract AC03-76SF00515. 21p. (CONF-8210123—1). NTIS, PC A02/MF A01. Order Number DE83007061.

From Magnetic monopole workshop; Racine, WI, USA (14 Oct 1982).

The report shows why the inadequacies of the standard model of elementary particles impel some theorists toward embedding the strong, weak and electromagnetic interactions in a simple GUT group, and explains why the grand unification scale and hence the GUM (Grand Unified Monopoles) mass are expected to be so large ($\geqq 10^{14}$ GeV). It goes on to describe some model GUTs, notably minimal SU(5) and supersymmetric (susy) GUTs. The grand unified analogues of generalized Cabibbo mixing angles are introduced relevant to the prediction of baryon decay modes in different theories as well as to the Decay modes catalyzed by GUMs. Phenomenologies of conventional and susy GUTs are contrasted including the potential increase in the grand unification scale as well as possible different baryon decay modes in susy GUTs. The phenomenology of GUMs is discussed, principally their ability to catalyze baryon decays. Some of the astrophysical and cosmological constraints on GUMs, GUMs, which make it difficult to imagine ever seeing a GUM and may impose serious restrictions on GUT model-building via their behavior in the very early universe are introduced. Finally, the reasons why GUMs are crucial aspects and tests of GUTs are summarized.

22303 (SLAC-PUB—3015) **Quark-antiquark bound-state spectroscopy and QCD.** Bloom, E.D. (Stanford Linear Accelerator Center, CA (USA)). Nov 1982. Contract AC03-76SF00515. 39p. (CONF-820709—3). NTIS, PC A03/MF A01. Order Number DE83007062.

From SLAC summer institute on particle physics; Stanford, CA, USA (17 Jul 1982).

The discussion covers quarks as we know them, the classification of ordinary mesons in terms of constituent quarks, hidden charm states and charmed mesons, bottom quarks, positronium as a model for quarti q, quantum chromodynamics and its foundation in experiment, the charmonium model, the mass of states, fine structure and hyperfine structure, classification, widths of states, rate and multipolarity of gamma transitions, questions about bottom, leptonic widths and the determination of Q/sub b/, the mass splitting of the n^3S_1 states, the center of gravity of the masses of the n^3P_j states, n^3 P_j fine structure and classification, branching ratios for upsilon′ → tau chi/sub 6j/ and the tau cascade reactions, hyperfine splitting, and top. (GHT)

22304 **(K^-,K^+) reaction and the dibaryon H.** Aerts, A.T.M.; Dover, C.B. (Brookhaven National Laboratory, Upton, New York 11973). *Physical Review Letters;* **49**: No. 24, 1752-1755(13 Dec 1982). Contract AC02-76CH00016.

Cross sections are estimated for the reaction ^3He $(K^-,K^+n)H$. This process affords a promising way of producing the stable six-quark dibaryon H (0^+,I = 0, strangeness -2) predicted by the bag model.

22305 **Perturbative QCD and weak asymmetries in lepton pair production.** Callaway, D.J.E. (High Energy Division, Argonne National Laboratory, Argonne, Illinois 60439). *Annals of Physics (New York);* **144**: No. 2, 282-344(Dec 1982).

The interference of electromagnetic and weak production mechanisms for lepton pair production may give rise to several effects which violate parity and charge symmetry. These effects are generally of the order of 1% for dilepton masses of 10 GeV. The theoretical calculations presented here show that experimental studies of these asymmetries may be useful. In particular, measurements of these asymmetries in collisions of pions with polarized protons may lead to a greatly enhanced understanding of the polarization distribution of quarks in a polarized proton. The polarization structure of d quark is shown to be of the special interest. Measurement of the parity-violating asymmetries in proton-polarized proton collisions may prove to be a sensitive probe of the flavor symmetry of the proton antiquark sea. Analysis of the parity conserving charge asymmetry (which is predicted to occur in collisions of unpolarized hadrons) allows a unique further test of the Dree—Yan model for lepton pair production, as well as of our understanding of weak interactions.

22306 **Fixed angle elastic scattering and the chromo-Coulomb phase shift.** Pire, B. (McGill Univ., Montreal, Quebec (Canada). Dept. of Physics); Ralston, J.P. (McGill Univ., Montreal, Quebec (Canada). Dept. of Physics; Argonne National Lab., IL (USA). High Energy Physics Div.). *Physics Letters,* [*Section*] *B;* **117**: No. 3/4, 233-237(11 Nov 1982).

The Sudakov-corrected Landshoff contributions to fixed angle elastic scattering are examined in perturbative QCD. We emphasize two aspects: the asymptotic power behaviour and the presence of imaginary parts of Sudakov corrections. The second effect, called the chromo-Coulomb phase shift, can introduce an oscillatory component with roughly logarithmic argument. This conclusion is in striking agreement with data for pp elastic scattering at 90^0 and medium energy.

22307 **Parity violation in pion electroproduction and photoproduction with a proton target.** Li, S.; Henley, E.M.; Hwang, W.P. (Institute for Nuclear Theory, Department of Physics, FM-15, University of Washington, Seattle, Washington 98195). *Annals of Physics (New York);* **143**: No. 2, 372-412(15 Oct 1982).

Parity violation in pion electroproduction and photoproduction in a proton target investigated as a possible means of elucidating the structure of the electronic and non-leptonic neutral weak currents. We calculate both parity-violating effects caused directly by Z-boson exchange, which contributes only to electron scattering, and those due to parity-violating electromagnetic and nuclear interactions. The asymmetry in electroproduction is of order 10^{-5}, whereas that in photoproduction is $\sim 10^{-7}$. The sensitivity to the parameter $\sin^2 \theta$/sub W/ is investigated; it is a maximum at backward electron scattering angles. In addition to the Born terms, contributions from the $\Delta(1232)$ resonance and the light vector mesons [rho(776) and $\omega(782)$] are included in the model. Fits to the observed π^0 and π^+ electroproduction and photoproduction cross sections indicate that the model accounts for production data in the medium energy region.

22308 **Hunting for the selectron.** Gaillard, M.K.; Hall, L. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.; California Univ., Berkeley (USA). Dept. of Physics); Hinchliffe, I. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). *Physics Letters,* [*Section*] *B;* **116**: No. 4, 279-282(14 Oct 1982).

The cross section for single selectron production in e^+e^- collisions is calculated, and the distribution of its decay esup(+-) is given. Observation of this energetic esup(+-) would provide the first experimental support for models of low energy supersymmetry; its absence puts a lower limit on the selectron mass in excess of the beam energy.

22309 **Finite size scaling and low mass glueballs.** Brower, R.C. (California Univ., Santa Cruz (USA). Physics Dept.); Creutz, M. (Brookhaven National Lab., Upton, NY (USA)); Nauenberg, M. (California Univ., Santa Barbara (USA). Inst. for Theoretical Physics). *Nuclear Physics* [*Section*] *B;* **210**: No. 2, 133-141(27 Sep 1982).

We propose finite lattice effects as a probe of the glueball mass spectrum, and give an analysis of the recent SU(2) Monte Carlo data of Brower, Nauenberg and Schalk in terms of a gas of free glueballs. For L^4 lattices with $L = 4, 5, 6$ fits are made to xi(m = 1/axi) which indicate a rather large effective number of degrees of freedom (i.e. statistical degeneracy where a spin J counts as 2J + 1) from 5 to 15 states. As the degeneracy is increased, the central glueball mass increases from $m = (1.3 +- 0.2)\sqrt{K}$ at degeneracy 5 to about $m = (1.9 +- 0.2)\sqrt{K}$ at degeneracy 15, relative to the SU(2) string tension $\sqrt{K}$.

22310 **Symmetry constraints in optimal polarization formalisms with an application to p-p scattering*.** Goldstein, G.R.; Moravcsik, M.J. (Department of Physics, Tufts University, Medford, Massachusetts 02155). *Annals of Physics (New York);* **142**: No. 2, 219-283(Sep 1982).

The paper contains results (a) for the general optimal polarization formalism with constraints from time reversal invariance, identical particles, and parity conservation, (b) for the specific reaction involving four spin-1/2 particles, (c) for the application of the formalism to elastic p-p scattering at 6 GeV/c and at 800 MeV. The choice of the orientation axes under various symmetry constraints is discussed for the general optimal formalism, showing the narrowing of the choices which nevertheless retains an infinite continuum of possibilities. The transformation properties of amplitudes among these various optimal frames are specified. The transformation of observables among these frames is also discussed for the reaction with four spin-1/2 particles. Then the relationship between the observables and the bilinear combination of amplitudes is given for the reaction which four spin-1/2 particles, for the constraints of identical particles, identical particles and time reversal invariance, and identical particles and time reversal invariance and parity conservation. The results are applied to the analysis of the Argonne data at GeV/c, $t = -0.6$ GeV^2/c^2, for elastic p-p scattering. The amplitudes are easily determined when the proper optimal frame is used, and the display of the amplitudes in other optimal frames suggest some features that may be significant in searching for dynamics. Another application is presented to 800 MeV elastic p-p scattering at several angles, showing that in the proper optimal frame very accurate results can be obtained about a subset of amplitude parameters on the basis of an incomplete set of data. Such an analysis is shown to be helpful in the design of future experiments.

22311 **Theory of hadron-deuteron elastic scattering in the GeV region.** Alberi, G.; Bleszynski, M.; Jaroszewicz, T. (Instituto di Fisica Teorica, Universita di Trieste, Miramare, Trieste, Italy). *Annals of Physics (New York);* **142**: No. 2, 299-358(Sep 1982).

A multiple scattering formalism for the medium energy hadron-deuteron elastic scattering is developed. This approach provides an extension of the Glauber theory incorporating the complete spin structure and the corrections to the eikonal and fixed scatterer approximations. The systematics of the spin observables and their relation to the hadron-deuteron as well as to hadron-nucleon amplitudes are discussed. An approximate cancellation between few corrections to the double scattering term is found which leaves the non-eikonal correction as the dominant one, and often, very important numerically, e.g., in the deuteron tensor polarization. Comparison of the parameter-free predictions of the theory based on the recent NN phase shift amplitudes with the data on polarization observables in pd elastic scattering is made.

22312 **Proton decay in supersymmetric models.** Dimopoulos, S. (Michigan Univ., Ann Arbor (USA). Dept. of Physics; Stanford Univ., CA (USA). Dept. of Physics); Raby, S. (Los Alamos National Lab., NM (USA)); Wilczek, F. (California Univ., Santa Barbara (USA). Inst. for Theoretical Physics). *Physics Letters,* [*Section*] *B;* **112**: No. 2, 133-136(6 May 1982).

We discuss proton decay in supersymmetric theories. We find that it is possible to obtain rates which are comparable with those of standard SU(5). In the presence of a discrete symmetry which occurs in an SU(5) supersymmetric unified model we obtain a definite prediction for the dominant decay mode, i.e. p → K^+ anti νsub(μ) and n → K^0anti νsub(μ).

22313 **Physics of intermediate vector bosons.** Ellis, J.; Gaillard, M.K.; Girardi, G.; Sorba, P. (CERN, Geneva, Switzerland). *Annual Review of Nuclear Science;* **32**: No. 1, 443-497(1982). Contract W-7405-ENG-48.

The properties and possible production Z^0 are reviewed. (AIP)

22314 **Charged-current neutrino interactions.** Fisk, H.E.; Sciulli, F. (Fermilab, Batavia, Illinois 60510). *Annual Review of Nuclear Science;* **32**: No. 1, 499-573(1982).

Deep inelastic νN interactions are reviewed. Quark model predictions are given and structure functions analyzed. (AIP)

22315 (LA—9572-C-Vol.1, pp 106-114) **CP violation.** Cronin, J.W. (Univ. of Chicago, IL). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

Eighteen years have passed since the discovery of CP violation. In this period of time many beautiful experiments have been carried out. The result of all these experiments is the conclusion that CP violation can be accounted for by a single number. We briefly review the present situation and indicate the most promising future experiments, some of which may be appropriate to consider for LAMPF II.

22316 (LA—9572-C-Vol.1, pp 156-170) **Lepton flavor nonconservation.** Rosen, P. (Purdue Univ., Lafayette, IN). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

Interest in lepton flavor nonconservation has grown in the past three years because it provides a signal for the existence of hitherto unobserved heavy particles, and for the grand unification of strong and electro-weak interactions. Heavy particles which may be associated with the violation of lepton flavor include: heavy leptons, especially neutral ones; new multiplets of Higgs scalars in addition to the one needed for the minimal Glashow-Weinberg-Salam model of electro-weak interactions; or new kinds of gauge vector bosons which transmit the horizontal symmetries between the various families of leptons and quarks. This something new aspect of the subject applies particularly to charged lepton processes like $\mu \rightarrow e\gamma$.

22317 (LA—9572-C-Vol.2, pp 406-408) **Report of the CP-violation working group.** Hoffman, C.M. (Los Alamos National Lab., NM). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

The CP-Violation Working Group met twice during the workshop. A nice summary of our present knowledge of CP-violation was presented in the talk by Prof. James W. Cronin. In the final paragraph of his talk, Prof. Cronin argues that higher precision experiments studying CP-violation at LAMPF II will be extremely important no matter what additional knowledge we acquire in the time before LAMPF II is constructed. The crucial issue at present is to uncover the underlying mechanism responsible for CP-violation. The Working Group heard several talks aimed at reviewing the theoretical status of CP-violation and the directions that future experimental efforts might take. These talks included: Kaon Experiments at KEK, T. Yamazaki, University of Tokyo; Mechanisms for CP Violation, P. Herczeg, Los Alamos; and The Experimental Status of eta$_{00}$ Experiments, J.W. Cronin, Univ. of Chicago. There were also extended discussions on which experiments appear to be the most important and how to best perform these measurements. A summary of these discussions is given.

22318 **Breaking of supersymmetry at intermediate energy.** Polchinski, J.; Susskind, L. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305). *Physical Review [Section] D: Particles and Fields;* **26**: No. 12, 3661-3673(15 Dec 1982). Contract AC03-76SF00515.

We consider the proposal that supersymmetry is broken at a scale μ midway between the Planck scale M and the usual weak scale. We show how a phenomenological explicitly softly broken supersymmetric theory can emerge below scale μ. The characteristic scale for the explicit supersymmetry breaking is of order $\alpha\mu^2$/M. Identifying this with the weak scale ~250 GeV gives $\mu \sim 10^{12}$ GeV.

22319 **Composite models of quarks and leptons and strong-coupling lattice gauge theories.** Quinn, H.R.; Drell, S.D.; Gupta, S. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94305). *Physical Review [Section] D: Particles and Fields;* **26**: No. 12, 3689-3700(15 Dec 1982). Contract AC03-76SF00515.

We extend a previous variational block-spin analysis of the realization of chiral symmetry in a strong-coupling lattice gauge theory to models which have been suggested as possibly describing massless composite fermions. In all cases we find massive fermion composites and spontaneous breaking of chiral symmetry. We also discuss the relevance of this result to the continuum limit.

6454 Field Theory

22320 (SLAC-PUB—2966) **Breakdown of QCD factorization theorems for inclusive reactions.** Brodsky, S.J.; Bodwin, G.T.; Lepage, G.P. (Stanford Linear Accelerator Center, CA (USA); Cornell Univ., Ithaca, NY (USA). Lab. of Nuclear Studies). Aug 1982. Contract AC03-76SF00515. 5p. (CONF-8206117—4). NTIS, PC A02/MF A01. Order Number DE83007007.

From 13. international symposium on multiparticle dynamics; Volendam, Netherlands (6 Jun 1982).

Initial state interactions are shown to violate standard factorization for massive lepton pair production and hadron-induced hard-scattering inclusive reactions order-by-order in QCD perturbation theory. Initial and final state interactions lead to a number of new physical phenomena including K_1 fluctuations, color correlations, anomalous nuclear number dependence of inclusive cross sections, and induced hadron production in the central rapidity region.

22321 (SLAC-PUB—3006) **GUTs and supersymmetric GUTs in the very early universe.** Ellis, J. (Stanford Linear Accelerator Center, CA (USA)). Oct 1982. Contract AC03-76SF00515. 14p. (CONF-8206156—1). NTIS, PC A02/MF A01. Order Number DE83007018.

From Nuffield workshop on the very early universe; Cambridge, UK (21 Jun 1982).

This talk is intended as background material for many of the other talks treating the possible applications of GUTs to the very early universe. I start with a review of the present theoretical and phenomenological status of GUTs before going on to raise some new issues for their prospective cosmological applications which arise in supersymmetric (susy) GUTs. The first section is an update on conventional GUTs, which is followed by a reminder of some of the motivations for going supersymmetric. There then follows a simple primer on susy and a discussion of the structure and phenomenology of simple sysy GUTs. Finally we come to the cosmological issues, including problems arising from the degeneracy of susy minima, baryosynthesis and supersymmetric inflation, the possibility that gravity is an essential complication in constructing susy GUTs and discussing their cosmology, and the related question of what mass range is allowed for the gravitino. Several parts of this write-up contain new material which has emerged either during the Workshop or subsequently. They are included here for completeness and the convenience of the prospective reader. Wherever possible, these anachronisms will be flagged so as to keep straight the historical record.

22322 Classical and quantal Liouville field theory. D'Hoker, E.; Jackiw, R. (Center for Theoretical Physics, Laboratory for Nuclear Science and Department of Physics, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Physical Review [Section] D: Particles and Fields;* **26**: No. 12, 3517-3542(15 Dec 1982). Contract AC02-76ER03069.

The canonical structure of the Liouville theory is investigated. We present two canonical transformations which map the theory onto a free field theory. The first makes use of conformal invariance and relies on a Yang-Feldman solution to the field equation. The second employs the inverse scattering method, which is uncommonly intricate, owing to the conformal invariance. We also analyze the quantized theory. Semiclassical arguments, supplemented by a study of the exact effective potential, suggest that the theory has a conformally invariant, continuous energy spectrum, bounded from below, but no translationally invariant ground state.

22323 More about hidden-symmetry algebra for the self-dual Yang-Mills system. Chau, L.; Yong-Shi, W. (Physics Department, Brookhaven National Laboratory, Upton, New York 11973). *Physical Review [Section] D: Particles and Fields;* **26**: No. 12, 3581-3592(15 Dec 1982).

The infinite-parameter "hidden symmetry" algebra for the complex self-dual SU(N) Yang-Mills fields is extended from SL(N,C)xC[λ] to SL(N,C)xC[λ,λ^{-1}]direct-sumSL(N, C). Furthermore, we also find an infinite set of infinitesimal "hidden symmetry" transformations, indexed by all integers, which can maintain the reality of the self-dual Yang-Mills potentials. Their infinite-parameter Lie algebra is shown to be related to an infinite-dimensional symmetric space with isotropy group SU(N)xR[λ].

22324 Consequences of a monopole with Dirac magnetic charge. Lazarides, G.; Shafi, Q.; Trower, W.P. (Department of Physics, Rockefeller University, New York, New York 10021). *Physical Review Letters;* **49**: No. 24, 1756-1758(13 Dec 1982). Contract AC02-81ER40033.

The discovery of a monopole with Dirac magnetic charge, $e/2\alpha$, would imply absolute quark confinement and forbid any free, fractional electrically charged particles, if no unknown long-range forces exist. Further, unification of electromagnetism and quantum chromodynamics would be required. The monopole also carries screened color magnetic fields. Certain alternatives to QCD in which the SU(3) gauge symmetry is broken, partially or completely, are excluded. The inflationary universe scenario based on SU(5) grand unified theory would be excluded.

22325 Ferromagnetic Ising model in noninteger spatial dimension. Baker, G.A. Jr.; Benofy, L.P. (Theoretical Division, Los Alamos National Laboratory, University of California, Los Alamos, New Mexico 87545.). *Journal of Statistical Physics;* **29**: No. 4, 699-779(Dec 1982).

Using the necessary and sufficient conditions in terms of the high-field series coefficients that the Yang-Lee theorem holds, we prove rigorously by counterexample that it cannot be extended to general noninteger dimension, when such models are defined by the "natural" analytic continuation.

22326 Glueball states in reduced large-N Hamiltonians. Levine, H.; Neuberger, H. (Schlumberger-Doll Research, Ridgefield, Connecticut 06877). *Physical Review Letters;* **49**: No. 22, 1603-1605(29 Nov 1982). Contract AC02-76ER02220.

It is shown that the reduced large-N/sub c/ Hamiltonian can reproduce not only the Wilson-loop expectation values but also the glueball spectrum of the infinite-volume lattice gauge theory. With the addition of fermions, the resulting quantum matrix model can potentially be used to calculate a large set of strong-interaction features.

22327 Neutral current phenomenology of supersymmetric SU(2) x U(1) x anti U(1) models. Kang, Y.S. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.; California Univ., Berkeley (USA). Dept. of Physics). *Physics Letters, [Section] B;* **117**: No. 5, 312-316(18 Nov 1982).

The neutral current sector of a class of supersymmetric SU(2) x U(1) x U tilde(1) models is parametrized. Bounds on the neutral boson masses are obtained from the low energy data, and the implications of future experimental findings for these models are discussed.

22328 Solving phi^{4}sub(1,2) field theory with Monte Carlo. Cooper, F.; Freedman, B.; Preston, D. (Los Alamos National Lab., NM (USA). Theoretical Div.). *Nuclear Physics [Section] B;* **210**: No. 2, 210-228(27 Sep 1982).

We study lattice g_0PHI^4 field theory for all g_0 and fixed renormalized mass M in one and two dimensions using Monte Carlo techniques. We calculate the dimensionless renormalized coupling constant anti gsub(R) = gsub(R)/Msup(4-d), where d is the dimension of space-time, at fixed small values of the lattice spacing a for various g_0 and lattice sizes. Our results are in quantitative agreement with the analyses of high temperature and strong coupling series which rely on extrapolation from large to small lattice spacing.

22329 Cosmological bounds on a left-right symmetric model. Huerta, R. (Fermi National Accelerator Lab., Batavia, IL (USA)). *Nuclear Physics [Section] B;* **204**: No. 3, 413-418(20 Sep 1982).

The right-handed neutrino cross sections of the processes νsub(L) + l → νsub(R) + l and νsub(R) + l → νsub(R) + l, where l is a relativistic lepton, are calculated in the SU(2)sub(L) x SU(2)sub(R) x U(1) model. According to a cosmological criterion the parameters of the model are bounded. In particular we obtain the bound Msub(WR) approx. >= 30 Msub(WL), assuming the neutrinos are Dirac four-component particles.

22330 Four families of composite quarks and leptons. Albright, C.H. (Fermi National Accelerator Lab., Batavia, IL (USA); Northern Illinois Univ., De Kalb (USA). Dept. of Physics); Schremp, B.; Schremp, F. (Hamburg Univ. (Germany, F.R.). 2. Inst. fuer Theoretische Physik). *Physics Letters, [Section] B;* **113**: No. 3, 225-230(17 Jun 1982).

Four families of composite quarks and leptons, two standard and two non-standard, are found in a unique solution SU(3)sub(HC) x SU(6)sub(L) x SU(6)sub(R) of a restricted 't Hooft anomaly-matching program. Testable predictions emerge, such as prohibition of $\mu \rightarrow e\gamma$, zero charge asymmetry in $e^+e^- \rightarrow$ rho$^+$ tau$^-$ in contrast to $e^+e^- \rightarrow \mu^+\mu^-$, and a rich new hadron spectrum masses around Msub(W). A minimal set of spectator fermions contains color-singlet objects with fractional quark-like charges.

22331 Simple viable models of low-energy supersymmetry. Hall, L.J. (California Univ., Berkeley (USA). Dept. of Physics); Hinchliffe, I. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). *Physics Letters, [Section] B;* **112**: No. 4/5, 351-355(20 May 1982).

Necessary conditions are established which must be satisfied by models of low-energy supersymmetry if they are to be phenomenologically acceptable at the tree level. These conditions enable one to solve the longstanding problem of giving the scalar partners of quarks and leptons large masses in such renormalizable models. A specific model is written down.

22332 What can we count on? A discussion of constituent-counting rules for interactions involving composite systems. Sivers, D. (Argonne National Laboratory, Argonne, Illinois 60439). *Annual Review of Nuclear Science;* **32**: No. 1, 149-175(1982).

QCD predictions for hadronic form factors and fixed-angle scattering are derived. (AIP)

22333 Solitons in one-dimensional charge density wave systems. Su, W.P. Philadelphia, PA; Pennsylvania Univ. (1981). 213p. University Microfilms Order No. 81-27,079.

Thesis.

Theoretical research on one dimensional charge density wave systems is outlined. A simple coupled electron-photon Hamiltonian is studied including a Green's function approach, molecular dynamics, and Monte Carlo path integral method. As in superconductivity, the nonperturbative nature of the system makes the physical ground states and low energy excitations drastically different from the bare electrons and phonons. Solitons carry quantum numbers which are entirely different from those of the bare electrons and holes. The fractional charge character of the solitons is an example of this fact. Solitons are conveniently generated by doping material with donors or acceptors or by photon absorption. Most predictions of the theory are in qualitative agreement with experiments. The one dimensional charge density wave system has potential technological importance and a possible role in uncovering phenomena which might have implications in relativistic field theory and elementary particle physics.

6455 Scattering Theory

22334 **(ANL/NESC—920) DEVOG; coupled molecular scattering equations.** Thomas, L.D. (Lawrence Berkeley Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048920.

The number of coupled equations which can be solved depends on the amount of main memory available.

DEVOG solves the coupled, second-order differential equations of atomic and molecular quantum scattering theory. The program is independent of the chemical system or the method (close coupling, coupled states, etc.). The physical problem is defined by user-supplied subroutines, POT and LIST.CDC7600,CYBER175; FORTRAN IV; SCOPE 2.1 (CDC7600), NOS 1.3 (CDC CYBER175); 144,000 (octal) words of memory are required to execute the sample problem.

22335 **(ANL/NESC—921) PC; coupled molecular scattering equations.** Thomas, L.D. (Lawrence Berkeley Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048921.

The number of coupled equations which can be solved depends on the amount of main memory available.

PC solves the coupled, second-order differential equations of atomic and molecular quantum scattering theory. The program is independent of the chemical system or the method (close coupling, coupled states, etc.). The physical problem is defined by user-supplied subroutines, POT and LIST.CDC7600,CYBER175; FORTRAN IV; SCOPE 2.1 (CDC7600), NOS 1.3 (CDC CYBER175); 143,000 (octal) words of memory are required to execute the sample problem.

22336 **(ANL/NESC—928) TDELAY; scattering phase shifts & time delays.** Le Roy, R.J. (Waterloo Univ., Ontario (Canada)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048928.

Maxima of - 6001 potentials 6001 mesh points.

TDELAY solves the radial or one-dimensional Schroedinger equation for any given (smooth) potential in the continuum of energies above its "dissociation threshold" to determine the scattering phase shift and collisional time delay associated with any given energy and partial wave (angular momentum state). If desired, TDELAY will also automatically locate and determine the width of orbiting, or shape, resonances defined by local maxima of the collisional time delay as a function of energy.IBM370,303x;CDC7600,CYBER175; FORTRAN IV; OS/370 (IBM370), SCOPE 2.1 (CDC7600), NOS 1.3 (CDC CYBER175); 190K bytes of memory are required to execute the IBM370 version of TDELAY; the CDC7600 version requires 60,000 (octal) words.

22337 **(ANL/NESC—940) INSCAT; inelastic scattering method.** Redmon, M.J. (Chemical Dynamics Corp., Columbus, OH (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048940.

Maximum of - 25 channels with the program's current dimensioning.

INSCAT solves the coupled, second-order differential equations of atomic and molecular quantum scattering theory.CDC7600,CYBER175; FORTRAN IV; SCOPE 2.1 (CDC7600), NOS 1.3 (CDC CYBER175); 113,000 (octal) words of memory are required to execute the sample problem.

22338 **(ANL/NESC—941) LOGD; multichannel log-derivative scattering.** Johnson, B.R. (Aerospace Corp., Los Angeles, CA (USA). Chemistry and Physics Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048941.

Maximum of - 10 coupled channels.

LOGD solves the close-coupled, Schroedinger equation of quantum scattering theory. An option for using a multi-channel WKB approximation is included in the program.CDC7600,CYBER175; FORTRAN IV; SCOPE 2.1 (CDC7600), NOS 1.3 (CDC CYBER175); 102,000 (octal) words of memory are required to execute the sample problem.

22339 **(ANL/NESC—942) MNN; solution of close coupling equations.** Truhlar, D.G.; Thirumalai, D. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048942.

The number of coupled equations which can be solved depends on the amount of main memory available.

MNN solves the coupled differential equations of the coupled-channel method for the quantum mechanical treatment of inelastic collisions of electrons, atoms, and molecules.CDC7600,CYBER175,74; FORTRAN IV; SCOPE 2.1 (CDC7600), NOS 1.3 (CDC CYBER175,74); 134,000 (octal) words of memory are required to execute the sample problem.

22340 **(ANL/NESC—945) KAPPAS; semiclassical transmission probability.** Truhlar, D.G. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048945.

The potential function, which is user-supplied, must tend to zero as x approaches negative infinity and have a single maximum located at $x=0$.

KAPPAS computes semiclassical transmission probabilities for a one-dimensional potential energy barrier and thermally averages them to obtain transmission coefficients. The error caused by use of the semiclassical approximation as compared to quantum mechanics is generally ten percent or less for typical potential energy barriers representing chemical reactions.CDC7600,CYBER74,175; FORTRAN IV; SCOPE 2.1 (CDC7600), NOS 1.3 (CDC CYBER74,175); 16,000 (octal) words of memory are required to execute the sample problem.

The data required for the creation of MUFT4, MUFT5, GAM1, and GAM2 libraries were generated from the Brookhaven National Nuclear Data Center ENDF/B tapes 114 through 117 by the ETOG1 program.CDC6600.

22342 **(BNL-NCS—51635) Review of Panel on Reference Nuclear Data surveys and discussions on reference nuclear data needs.** Burrows, T.W. (Brookhaven National Lab., Upton, NY (USA)). Oct 1982. Contract AC02-76CH00016. 16p. NTIS, PC A02/MF A01. Order Number DE83008473.

The results of the six meetings in the years 1976 through 1981 of the Panel on Reference Nuclear Data is reviewed, as well as the results of other studies and workshops. A brief review of how current programs are meeting the expressed nuclear data needs of professional groups is also presented. The types of data included in the review are reaction cross sections, isotopic abundances, atomic masses, nuclear structure, radioactive decay, and fission.

22343 **(DOE/ER/04936—8) Nuclear spectroscopic studies. Progress report, June 1, 1982-May 31, 1983.** Bingham, C.R.; Guidry, M.W.; Riedinger, L.L. (Tennessee Univ., Knoxville (USA). Dept. of Physics and Astronomy). 28 Feb 1983. Contract AS05-76ER04936. 72p. NTIS, PC A04/MF A01. Order Number DE83008192.

Activities of the Nuclear Physics Group at the University of Tennessee are reported. Recent accomplishments and results are described under the headings: properties of high spin states, nuclear structure from heavy ion reactions, UNISOR studies, theory, and developmental activities. Organizational activities are described, and publications and invited talks are listed. (WHK)

22344 **(DOE/ER/40016—T1) Technical progress report.** (Colorado Univ., Boulder (USA). Nuclear Physics Lab.). 1 Oct 1982. Contract AC02-81ER40016. 62p. (NPL—936). NTIS, PC A04/MF A01. Order Number DE83000719.

This report summarizes the work carried out by personnel at the Nuclear Physics Laboratory of the University of Colorado from about August 1, 1981 to October 1, 1982, under contract with the Department of Energy. The intermediate energy studies summarized in this report were carried out at the meson physics facilities at Los Alamos (LAMPF), the cyclotron at Indiana University (IUCF), and the meson physics facilities at Vancouver (TRIUMF). This year, for the first time, intermediate energy experimental studies are being reported in separate documents from the low energy and theoretical nuclear physics efforts. Experimental studies are reported on pion-nucleus interactions, charge exchange reactions, nucleon transfer reactions, and apparatus development.

22345 (LA—9572-C-Vol.1, pp 282-288) **Report of the nuclear physics working group.** Stein, N. (Los Alamos National Lab., NM); Hintz, N. Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

The Nuclear Physics Working Group met during two afternoon sessions of the Workshop to discuss the opportunities and directions for nuclear physics research that will be offered by LAMPF II. Principal topics of discussion were hypernuclear physics, double strangeness exchange and the nuclear response to the mesonic probes, K and π, and the baryonic probes p and anti p at LAMPF II energies. The final session was capped by a roundtable discussion on New Directions in the Microscopic Description of Nuclei Offered by LAMPF II. The Working Group report and summary is presented as prepared by the chairmen.

22346 (LA—9572-C-Vol.2, pp 648-657) **Summary report of the LAMPF II nuclear chemistry working group.** Dropesky, B.J. (Los Alamos National Lab., NM). Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

The prospect of having relatively high-intensity beams of kaons, antiprotons, and high-energy pions and protons from LAMPF II opens up some exciting avenues of research by the nuclear chemistry community. Beams of kaons and antiprotons of adequate intensity and purity have not been available heretofore to carry out definitive activation studies of the interaction of these probes with complex nuclei. Such studies will therefore be discussed first. Extension of our present investigations into pion-induced nuclear reactions to higher energies and the utilization of multi-GeV protons at substantial intensities for producing new nuclei far from stability will then be discussed.

22347 **(UCID—18987-83) Report to the DOE Nuclear Data Committee, 1983.** Haight, R.C.; Struble, G.L. (Lawrence Livermore National Lab., CA (USA)). Feb 1983. Contract W-7405-ENG-48. 16p. NTIS, PC A02/MF A01. Order Number DE83008295.

Measurements for nuclear data applicactions are described including branching ratio in ^{7}Be decay, kerma factor for carbon, photoneutron cross sections, neutron differential scattering cross sections, half-life of ^{77}Kr, stellar neutron capture rates for ^{86} ^{87} ^{88}Sr, neutron total cross sections, ^{142} ^{143} ^{144}Nd neutron capture nucleosynthesis, half-life of ^{163}Ho, thermal neutron fission of ^{236}Np, revised branching ratios in ^{237}U and ^{238}Pu decays, and levels of ^{244}Cm populated by the beta decay of 10-hour ^{244}Am and 26-minute /sup 244m/Am. Calculations discussed include systematic test of microscopic optical models for nucleon scattering in the range 7 to 60 MeV, Lanczos method shell-model calculations of GamowTeller strength functions, explosive nucleosynthesis and direct radiative capture rates, and calculation of fission cross sections. Evaluated data libraries are briefly discussed. (WHK)

6511 Experimental Techniques

22348 **(ANL/NESC—333) TOAD; processing of analyzer gamma-ray spectra.** Busch, D.D. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048333.

TOAD will handle up to 100 spectra at a time from analyzers with 4096 channels or fewer.

TOAD is used to process and analyze gamma ray spectra.UNIVAC1108; FORTRAN IV and Assembly language; EXEC2, GAX33; 32K memory.

22349 **(ANL/NESC—475) CRECT;CHECKER;RIGEL;PLOTFB; LISTFC;DICTION;SLAVE3;DAMMET ENDF/B V2 processing codes.** Ozer, O. (Brookhaven National Lab., Upton, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048475.

This package of eight programs is designed for processing ENDF/B II (Evaluated Nuclear Data File Version B Format II) tapes. CRECT, which processes Version III ENDF/B data as well as earlier versions, provides a means of correcting assembled data on a tape by insertion and deletion of data. CHECKER checks that the ENDF/B BCD card image format tapes are in proper format and all fields are within specified limits, rather than the physics of the data library. Angular distributions reconstructed from Legendre coefficients are checked to ensure they are everywhere positive. RIGEL will perform any or all of the following operations - selectively retrieve ENDF/B data on from 1 to 9 ENDF/B tapes, merge retrieved ENDF/B data onto from 1 to 8 ENDF/B result tapes, change tape arrangement (from standard to alternate or vice versa) and change tape mode. LISTFC, which processes Version III ENDF/B data as well as earlier versions, produces interpreted listings of information from BCD standard arrangement ENDF/B tapes. DICTION constructs a new section dictionary (file 1, section 451) for an entire ENDF/B tape. If a section dictionary is already present it is replaced. PLOTFB processes ENDF/B library tapes which contain data embedded within a necessary library structure in order to produce comprehensive listings and/or plots.

From 9. EPS Nuclear Physics Divisional conference on nuclear structure; Amsterdam, Netherlands (29 Aug 1982).

Data from pion inelastic scattering and charge-exchange experiments are discussed within the framework of a DWIA analysis. The properties of the pion-nucleon interaction transformed to the pion-nuclear system are used to infer new nuclear-structure information for both discrete states and giant resonances.

22352 **(DOE/NBM—3007675) Beta decay rate of ^{16}N(0^-, 120 keV): meson exchange currents and the value of the induced pseudoscalar-coupling constant.** Gagliardi, C.A. III. (Princeton Univ., NJ (USA). Dept. of Physics). Oct 1982. Contract W-31-109-ENG-38. 124p. NTIS, PC A06/MF A01. Order Number DE83007675.

Thesis.

The beta-decay branching ratio R(β) for the transition ^{16}N(0^-, 120 keV) $\rightarrow$ ^{16}O (0^+, g.s.) + e^- + anti nu is remeasured. The rate of this $0^- \rightarrow 0^+$ transition $\Lambda(\beta)$ is expected to receive a large enhancement from pion-exchange-current contributions to the weak axial-vector time component. The beta-decay rate may also be combined with the muon-capture rate $\Lambda(\mu)$ for the inverse reaction μ^- + ^{16}O(0^+, g.s.) $\rightarrow$ ^{16}N(0^-, 120 keV) + nu/sub μ/ to obtain the induced pseudoscalar coupling constant g/sub P/ in finite nuclei. The experimental results are compared to recent realistic calculations of $\Lambda(\beta)$ and $\Lambda(\mu)$ in which 2-particle, 2-hole components are included in the ^{16}O ground state and 3-particle, 3-hole components are included in the ^{16}N 0^- state, while three different residual interactions are utilized to determine the wavefunctions. We find R(β) = (3.42 +- 0.37) x 10^{-6}. This agrees with the only previous measurement R(β) = (3.5 +- 0.7) x 10^{-6}. The beta-decay rate $\Lambda(\beta)$ = (0.45 +- 0.05) $\sec^{-1}$, which agrees with the calculations only when pion-exchange currents are included. The nucleons-only impulse approximation underestimates $\Lambda(\beta)$ by more than a factor of 3, independent of the residual interaction. This confirms the important role of pion exchange in the weak axial-vector time component. The measured ratio $\Lambda(\mu)/\Lambda(\beta)$ implies that g/sub P//g/sub A/ = 11 +- 2 for the nucleon in finite nuclei. This result is model dependent. It assumes that $\Lambda(\mu)/\Lambda(\beta)$ is independent of the nuclear model used in its calculation, as is approximately true in the recent calculations.

22354 **Measurement of the p-C analyzing power between 100 and 750 MeV and the p-Be analyzing power at 780 MeV.** Ransome, R.D.; Hollas, C.L.; Riley, P.J. (Texas Univ., Austin (USA)); Bonner, B.E.; Cornelius, W.D.; Van Dyck, O.B.; Hoffman, E.W.; McNaughton, M.W.; York, R.L. (Los Alamos National Lab., NM (USA)); Wood, S.A. (Massachusetts Inst. of Tech., Cambridge (USA)). *Nuclear Instruments and Methods in Physics Research;* **201**: No. 2/3, 315-321(15 Oct 1982).

The inclusive p-C analyzing power has been measured for laboratory scattering angles between 4° and 25°, for energies between 100 and 750 MeV. The inclusive p-Be analyzing power has been measured at 780 MeV between 4° and 28°. The experiment was performed at LAMPF using a large solid angle polarimeter. An energy dependent empirical fit to these data as well as to data from SIN and TRIUMPF is presented. The data from all three facilities are in generally good agreement.

Maximum of - 19 reaction types.

THRES2 calculates neutron-induced reaction cross sections from 0 to 20 MeV and fission spectrum averages for nuclides having 21 to 82 protons. Reaction products considered are 2n, 3n, p, d, t, He-3, alpha, np, nd, nt, n-He3, n-alpha, pn, 2p, p-alpha, alpha-n, alpha-p, and dn.CDC6600;IBM360; FORTRAN IV; SCOPE (CDC6600), OS/360 (IBM360); The program uses 13K (decimal) on the CDC6600.

22356 **(CONF-820896—6) High-spin resonances in heavy-ion collisions.** Betts, R.R.; Saini, S. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 18p. NTIS, PC A02/MF A01. Order Number DE83007800.

From Nordic meeting on nuclear physics; Fuglso, Denmark (16 Aug 1982).

Excitation functions for elastic scattering and reactions of ^{28}Si + ^{28}Si show evidence for the existence of narrow (Γ = 100 to 200 keV) high-spin (J $\approx$ 40 π) resonances. The interpretation of these resonances as high-spin fissioning shape isomers is discussed with reference to data for the ^{28}Si + ^{30}Si and ^{30}Si + ^{30}Si systems.

22357 **(CONF-8110242—2) High-angular-momentum resonances in ^{28}Si + ^{28}Si scattering.** Betts, R.R. (Argonne National Lab., IL (USA)). Oct 1981. Contract W-31-109-ENG-38. 14p. NTIS, PC A02/MF A01. Order Number DE83007762.

From International workshop on resonances in heavy ion collisions; Bad Honnef, F.R. Germany (12 Oct 1981).

The initial expectation was that resonance behavior in heavy-ion systems would be limited to only a few special systems and to energies not too far above the Coulomb barrier. The past few years have shown us that this behavior has a much wider extent than was previously thought possible, although in many cases the indications of resonance behavior is at best qualitative. Results are presented for the ^{28}Si + ^{28}Si system - the heaviest in which resonance behavior has yet been observed. (WHK)

22358 **(DOE/ER/10710—3) Nuclear-structure studies via neutron interactions. Progress report, July 1, 1982-June 30, 1983.** Carlton, R.F. (Middle Tennessee State Univ., Murfreesboro (USA)). Feb 1983. Contract AS05-80ER10710. 17p. NTIS, PC A02/MF A01. Order Number DE83008268.

Resolved resonances from neutron total cross section measurements on ^{186} ^{188}Os have been analyzed by a Reich-Moore multilevel code to obtain parameters for a total of 27 resonances. Strength functions and level spacings have been deduced and firm J/sup π/ assignments have been made. Preliminary parameters have been obtained from 500 eV to 5 keV in an effort to overlap with average total cross section measurements. Neutron transmission and capture measurements upon ^{34}S have been analyzed to obtain resonance parameters for s-, p-, and d-wave neutrons. Theoretical doorway state configurations have been assigned to specific groups of these resonances based upon shell model and core-vibration calculations. Using the ^{30}Si+n reaction as a probe two J=1/2+ resonances in ^{31}Si, predicted from shell model calculations, have been found. An observed uniform fragmentation of p-wave strength is in agreement with calculations of negative parity states for ^{30}Si and ^{32}S. Parameterization of the additional information contained in the regions between resonances and often ignored has permitted the determination of average scattering functions for s- and p-waves for ^{30}Si+n and ^{34}S+n. Their description with an optical model potential suggests a real well depth 20% greater for p-waves than for s-waves. Results are consistent with coupled channels calculations and results of a similar analysis for ^{32}S+n.

22361 **Isomer ratio measurements for the reaction ^{29}Si(^{18}O, p2n)sup(44m,44g)Sc.** Groening, H.; Aleklett, K.; Moody, K.J.; McGaughey, P.L.; Loveland, W.; Seaborg, G.T. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). *Nuclear Physics* [*Section*] *A;* **389**: No. 1, 80-92(8 Nov 1982).

Isomer ratios for the reaction ^{29}Si(^{18}O, p2n)sup(44m)Sc, sub(44g)Sc have been deduced from activity measurements for projectile energies between 30 and 99 MeV. Statistical model calculations show that the isomer ratio dependence on projectile energy up to about 80 MeV can be adequately described by assuming a fixed ratio of quadrupole to dipole γ-ray strengths. Such a ratio of E2/E1 strengths agrees with corresponding values deduced from the literature. The values of the γ-ray strength ratios needed to fit the experimental isomer ratios are extremely sensitive to the relative amounts of quadrupole γ-ray admixture and to the presence of discrete levels other than those which conform to the yrast line.

22362 **Interactions of polarised tritons with ^{32}S.** Barnwell, J.M. (Birmingham Univ. (UK). Dept. of Physics); Griffiths, R.J. (King's Coll., London (UK). Wheatstone Physics Lab.); Brown, R.E.; Hardekopf, R.A.; Jarmie, N.; Correll, F.D. (Los Alamos National Lab., NM (USA)). *Nuclear Physics* [*Section*] *A;* **388**: No. 3, 542-562(1 Nov 1982).

Cross sections and analysing powers have been measured for the elastic and inelastic scattering of tritons from ^{32}S, along with the ^{32}S(t vector, α)^{31}P reaction data, using the 17 MeV polarised triton beam available at the Los Alamos National Laboratory. An optical model analysis of the elastic scattering data has yielded a triton spin-orbit potential with an unconventional geometry. The inelastic analysing powers have shown a requirement for including the deformation of the spin-orbit potential in the coupling potential form factor. The (t vector, α) reaction data have been analysed using the zero-range DWBA. Certain features of this reaction data which could not be described by th e DWBA are well predicted when the analysis is extended to include explicitly the inelastic couplings and two-step processes through a CCBA calculation.

22364 **(Juel-Spez—158) Study of the level schemes of ^{75}Se, ^{76}Se, and ^{77}Se by capture of thermal neutrons.** Tokunaga, Y. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Kernphysik). Jun 1982. 156p. (In German). Available from Fachinformationszentrum Energie, Physik, Mathematik, Karlsruhe (Germany, F.R.).

Dissertation submitted to Koeln Univ. (Germany, F.R.).

Slow-neutron capture γ-ray spectroscopy was carried out with metallic targets of ^{74}Se and ^{76}Se at Juelich, where the high-energy (n,γ) spectrum was measured with a pair spectrometer, and at Grenoble, where ^{74}SePb and ^{76}SePb alloy targets were exposed in high neutron flux regions for pair spectroscopy of the primary (n,γ) lines, for low-energy (n,γ) spectroscopy with the high-resolution curved crystal spectrometers, and for (n,e$^-$)-measurements with the conversion-electron spectrometer BILL. Gamma-decay schemes were constructed and very precise energies were obtained for sup(75-78)Se and for ^{75}As. For several states new Jsup(π) assignments could be made and for others ambiguities could be resolved. The ^{75}Se(n,γ) reaction was observed for the first time due to successive neutron capture in ^{74}Se in the high flux reactor at Grenoble. The cross section of this reaction was found to be approx. equal to 300+-100 b. The SePb targets have also allowed a study of the K X-ray widths of Pb. These widths show small deviations from theoretical values. Comparison of the primary (n,γ) transition strengths and the corresponding (d,p)-spectroscopic factors have revealed a significant difference in the neutron capture mechanisms for ^{74}Se(n,γ) and ^{76}Se(n,γ). The comparisons of the sup(75-77)Se level schemes with those of neighbouring nuclei and with the predictions of various nuclear models show that present theories are not yet able to describe the structures of the low-spin states in the neutron deficient Se isotopes satisfactorily.

22365 **Precision mass difference measurements in light rubidium and krypton isotopes utilizing beta-endpoints.** Moltz, D.M.; Toth, K.S. (Oak Ridge National Lab., TN (USA)); Avignone, F.T. From Workshop on physics at LEAR with low energy cooled antiprotons; Erice, Italy (9 May 1982).

The antiproton beams from LEAR are a means for uncovering a hopefully fertile source of physics in the interactions of antiparticles with nuclei. Bound or resonant states have been searched for in the anti N N system and perhaps one candidate found. Resonances in the anti N-A system may have an independent origin, unrelated to isolated states in the two-body system but nevertheless very revealing of the essential nature of the two-body forces. The use of antiproton projectiles to study conventional, and occasionally exotic nuclear structure warrants some attention because of the extreme peripherality of many anti p-induced reactions and the expected strong iso-spin selectivity for inelastic excitation of say giant resonances. The annihilation channels which generate strong absorption in the nuclear interior, localize direct reactions in the nuclear surface. In this fashion anti p's ressemble heavy-ion projectiles but possess the virtue of being a rather more elementary probe and it should be possible to calculate the average anti p-A interaction (optical potential) from something closer to first principles. Perhaps the most fundamental reason for using antinucleons is as carriers, into the target, of antiquarks. It is not at all clear that the sea quarks in a hadron, i.e. in the form of quark-antiquark pairs, exist on an equal footing with valence quarks. The production of cc states (and even of s anti s) appears highly suppressed in nucleon-nucleon collisions. This suppression must be taken into account in establishing the relative merits of pp or p anti p colliders in producing say the W-meson. By introducing antiquarks directly via anti N N and anti N-A one should surely obtain more definite information about q anti q interactions with LEAR, at the low momenta presumably crucial for hadron structure. 22368 (CONF-8110181—4) Alpha-transfer reactions. Betts, R.R. (Argonne National Lab., IL (USA)). Oct 1981. Contract W-31-109-ENG-38. 11p. NTIS, PC A02/MF A01. Order Number DE83007761.

From Conference on nuclear technology in developing countries: problems and prospects; Trieste, Italy (12 Oct 1981).

Some of the essential features of the experimental results and theoretical interpretations of α-transfer reactions are summarized. (WHK)

22369 (DOE/ER/10493—12) Atomic-mass measurements and nuclear spectroscopy at TRISTAN. Progress report, February 1, 1982-January 31, 1983. Brenner, D.S. (Clark Univ., Worcester, MA (USA)). Feb 1983. Contract AC02-79ER10493. 38p. NTIS, PC A03/MF A01. Order Number DE83007331.

The research program is concerned with the measurement of atomic masses and decay modes of neutron-rich fission products and, with understanding the nuclear structure effects which give rise to these properties. This work is accomplished, primarily, by use of the TRISTAN on-line mass separator located at the High Flux Beam Reactor, Brookhaven National Laboratory. The determination of accurate masses for neutron-rich nuclei is useful in testing and refining mass equations which, in turn, find important application in calculations of astrophysical processes and for control and safety of nuclear reactors. The thrust of the spectroscopic studies has been to develop a data base for neutron-rich, far-from-stability nuclides in order to provide a new testing ground for nuclear models. In particular, we have been active in pursuing microscopic and phenomenological understanding of nuclear structure in regions of shape transition near shell and subshell closures.

22370 (DOE/ER/10516—15) Progress report and renewal proposal. Signell, P. (Michigan State Univ., East Lansing (USA). Dept. of Physics). 1982. Contract AC02-79ER10516. 9p. NTIS, PC A02/MF A01. Order Number DE83008331.

We have been working mainly on five inter-related subprojects: (1) derivation of the intermediate range nucleon-nucleon interaction with the new dramatically altered $\pi\pi$ s-wave interaction and using a new method that utilizes much shorter and simpler analytic continuation through the unphysical region that lies between the πN and $\pi\pi$ physical regions of the N anti N$\rightarrow\pi\pi$ amplitude (with significantly improved accuracy for the nucleon-nucleon interaction); (2) construction of a short range phenomenological potential that, with the theoretical part mentioned above, gives a precise fit to the nucleon-nucleon data and is parameterized for easy use in nucleon calculations; (3) phase shift analyses of the world data below 400 MeV, especially the large amount of very precise data below 20 MeV and the new data near 55 MeV that have never been analyzed properly, and determining which phrases are given by theory at which energies; (4) the introduction of our K-matrix formulation of the Optimal Polynomial Expansion in order to accelerate convergence of the partial wave series at LAMPF energies; and (5) setting up of a cooperatively evaluated and verified permanent nucleon-nucleon data bank in the 0-1200 range that can be used by all nucleon-nucleon researchers (or anyone else) via Telenet dial-in and by means of a published compendium. Progress is reported. (WHK)

22371 (NASA-TM—83224) Analytic optical potentials for nucleon-nucleus nucleus-nucleus collisions involving light and medium nuclei. Bidasaria, H.B.; Townsend, L.W. (National Aeronautics and Space Administration, Hampton, VA (USA). Langley Research Center). Jan 1982. 25p. NTIS, PC A02/MF A01.

REFS.

Utilizing an optical model potential approximation to the exact nucleus-nucleus multiple-scattering series, optical potentials for nucleon-nucleus and nucleus-nucleus collisions are analytically derived. These expressions are applicable to light and medium cosmic ray nuclei as their single-particle density distributions are analytically determined, without approximation, from their actual harmonic well charge density distributions. Pauli correlation effects are included through the use of a simple Gaussian function to replace the usual expression obtained in the infinite nuclear matter approximation.

22372 (PB—82-208463) Electron excitation in atoms and molecules by neutron-nucleus scattering. (Science and Engineering Research Council, Chilton (UK). Rutherford Appleton Lab.). [nd]. 19p. (RL—82-016). NTIS, PC A02/MF A01.

The electronic excitation of atoms and diatomic molecules arising from neutron-nucleus scattering is examined. Both center-of-mass recoil and the coupling between electrons and nuclei arising from non-adiabatic terms neglected in the Born-Oppenheimer approximation are considered. A significant cross-section from center-of-mass recoil is predicted for single atoms for sufficiently large changes in the wavevector of the neutron. The non-adiabatic terms give rise to small cross-sections for molecules unless the spacing of the electronic states is comparable with the rotational energy constant, which is possible for transition between excited states. 22373 **Statistical properties from high resolution proton resonance reactions.** Mitchell, G.E. (North Carolina State Univ., Raleigh). pp 33-60 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

High resolution proton resonance measurements are of great value in the study of statistical and non-statistical effects involving compound nuclear resonances. First, these measurements provide valuable information on both global and local properties of widths and spacings. This information is a valuable supplement to that obtained from neutron experiments. Second, as Mahaux and Weidenmueller summarize: Isobaric analog resonances provide the best understood examples of doorway states. They are thus well suited for an experimental check of the theory. Third, the measurement of channel spin interference effects provide the most sensitive test yet for certain aspects of statistical theories, as well as providing examples of new types of intermediate structure. Examples are discussed.

From High angular momentum properties of nuclei conference; Oak Ridge, TN, USA (2 Nov 1982).

Changes of nuclear shapes at high spin have been observed in several transitional nuclei, including ^{153} ^{154}Dy and ^{186}Hg. In the Dy isotopes a transition from collective to single-particle character appears at high spin suggesting a change from prolate to oblate shapes. In ^{186}Hg, decoupled i/sub 13/2/ quasiparticle bands with prolate and oblate shapes may have been observed in two crossing bands. The present discussion focusses on the polarizing effect of high-j rotation-aligned particles on the soft cores of these nuclei. Studies of the decay of the compound nucleus ^{156}Er, produced at the rather low excitation energy of 46 MeV in the reaction ^{64}Ni + ^{92}Zr, are also reported. Measurements of neutron spectra as a function of γ-sum energy and of the neutron multiplicity distribution have been performed. Comparison with the results of statistical model calculations suggests a suppression of neutron emission and it is speculated that this might be due to trapping in a superdeformed well.

22381 **Study of the rotational side-bands in ^{162}Dy.** Fields, C.A.; Hicks, K.H.; Ristinen, R.A. (Colorado Univ., Boulder (USA). Nuclear Physics Lab.); De Boer, F.W.N. (Colorado Univ., Boulder (USA). Nuclear Physics Lab.; Fribourg Univ. (Switzerland). Inst. de Physique); Walker, P.M. (Science Research Council, Daresbury (UK). Daresbury Lab.; Michigan State Univ., East Lansing (USA). Cyclotron Lab.); Borggreen, J. (Niels Bohr Inst., Roskilde (Denmark)); Peker, L.K. (Brookhaven National Lab., Upton, NY (USA). National Nuclear Data Center). *Nuclear Physics [Section] A;* **389**: No. 2, 218-246(15 Nov 1982).

Rotational side-bands in ^{162}Dy have been studied using the ^{160}Gd(α, 2nγ) ^{162}Dy reaction. Seven side-bands are observed, with Ksup(π) = 2^+, 2^-, $(0)^-$, 0^+, 5^-, 4^+ and (6^-). Four of these bands have collective structure at low spin: the Ksup(π) = 2^+ γ-vibrational band, the Ksup(π) = 0^+ β-vibrational band, and the Ksup(π) = 2^- and $(0)^-$ octupole vibrational bands. Of the remaining bands, the 4^+ band is deformation coupled while the 5^- and (6^-) bands are rotation-aligned. Several bandcrossings are observed in this nucleus. The β- and γ-bands are crossed at I = 6h and 12h, respectively, by a highly aligned $(\text{isub}(13/2))^2$ S-band; extrapolation of this S-band to higher spin suggests that it crosses the g.s.b. between I = 18h and 20h. The 2^- octupole band is crossed by the 5^- band at I = 9h and again by the (6^-) band at I = 12h. The latter bandcrossings are discussed in terms of two-quasiparticle plus rotor calculations.

22382 **Low lying 1^+ and 2^- states in doubly-odd terbium, holmium, and thulium nuclei.** Toth, K.S.; Ellis-Akovali, Y.A.; Moltz, D.M. (Oak Ridge National Lab., TN (USA)); Mlekodaj, R.L. (UNISOR, Oak Ridge, TN (USA)). *Physics Letters,* [*Section*] *B;* **117**: No. 1/2, 11-14(4 Nov 1982).

The β-decay properties of sup(150,152,154)Er and ^{156}Yb were investigated. It was found that, as in the case of sup(148,150,152)Dy, these nuclides decay predominantly to single 1^+ states in their doubly-odd daughters. Possible prolate configurations are proposed for the 1^+ levels and the 2^- isomeric states to which they deexcite.

22383 **(CONF-8206132—2) Nuclear-breakup mechanisms in the interaction of relativistic projectiles with heavy targets.** Steinberg, E.P. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 10p. NTIS, PC A02/MF A01. Order Number DE83007614.

From Nuclear reaction mechanism conference; Varenna, Italy (14 Jun 1982).

The breakup of a Au nucleus under bombardment with relativistic p, α, and ^{20}Ne has been investigated in an extensive, multidetector study. The present discussion addresses some of the many aspects of the experimental results. A broad distribution of coincident fragment masses is observed, with the total fragment kinetic energy being higher than expected for a fission mechanism for total fragment mass $\leqq 120$. The formation of light fragments is shown to be inconsistent with a binary breakup mechanism, and a multi-fragment target breakup is suggested. In general, the results indicate a broad spectrum of violence in the collisions, from gentle, leading to the production of heavy spallation products and fission, to essentially explosive, leading to multi-fragment breakup into light mas products. These aspects of the reactions represent a late-stage breakup of the target residues and are positively correlated with the violence of the initial fast stage of the collision as measured by the charged particle multiplicity.

22384 **Strengths of E0 transitions in ^{188}Os and ^{196}Pt and the structure of IBA wavefunctions in the Os-Pt transition region.** Kane, W.R.; Casten, R.F.; Warner, D.D. (Brookhaven National Lab., Upton, NY (USA)); Schreckenbach, K.; Faust, H.R.; Blakeway, S. (Institut Max von Laue - Paul Langevin, 38 - Grenoble (France)). *Physics Letters,* [*Section*] *B;* **117**: No. 1/2, 15-19(4 Nov 1982).

In ^{188}Os and ^{196}Pt produced by thermal neutron capture E0 transitions have been investigated. The predictions of the interacting boson approximation are compared with the experimental results and discussed in terms of the detailed structure and systematics of individual energy levels in the transition from the IBA O(6) limit toward the deformed rotor.

22385 **(ANL/NDM—74) Evaluation of the ^{238}U neutron total cross section.** Smith, A.; Poenitz, W.P.; Howerton, R.J. (Argonne National Lab., IL (USA)). Dec 1982. Contract W-31-109-ENG-38. 27p. NTIS, PC A03/MF A01. Order Number DE83007898.

Experimental energy-averaged neutron total cross sections of ^{238}U were evaluated from 0.044 to 20.0 MeV using regorous numerical methods. The evaluated results are presented together with the associated uncertainties and correlation matrix. They indicate that this energy-averaged neutron total cross section is known to better than 1% over wide energy regions. There are somwewhat larger uncertainties at low energies (e.g., $\leqq 0.2$ MeV), near 8 MeV and above 15 MeV. The present evaluation is compard with values given in ENDF/B-V.

22386 **(ANL/NESC—327R) DAFT1; least squares fit for fissile nuclide data.** Harris, D.R. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048327.

Data are fitted for a maximum of 3 fissile nuclides.

DAFT1 is a program for weighted least squares fitting of 0.0253 eV neutron data for fissile nuclides. The program also carries out computations relevant to discerning overall goodness of fit, particularly deviant data, and data whose improvement would lead to large reductions in error of each fitted parameter.CDC6600; FORTRAN IV; 32000 (octal) central memory locations.

22387 **(ANL/NESC—470R) GRAMP; r-m parameters of unresolved resonances.** Goldsmith, M. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048470.

The maximum number of resonances per spin state is 100. Two compound nucleus spin states are allowed and each spin state may have two open fission channels.

GRAMP randomly generates Reich and Moore parameters for multilevel unresolved resonances of fissile isotopes.CDC6600; FORTRAN IV.

22391 (LA—9572-C-Vol.2, pp 422-427) **Study of fission dynamics by muon-induced fission.** Oberacker, V.E. (Vanderbilt Univ., Nashville, TN); Maruhn, J.A. Nov 1982. NTIS, PC A17/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

Prompt fission of ^{240}Pu induced by internal conversion in muonic atoms is studied theoretically. We treat the fission mode classically in terms of an elongation and a mass asymmetry coordinate and solve the time-dependent Schroedinger equation for the muon in the Coulomb field of the fissioning nucleus by methods similar to TDHF. The muon attachment to the light and heavy fission fragment is calculated as function of the friction coefficient and the fragment mass asymmetry.

22392 **(LBL—15685) Nuclear reactions and synthesis of new transuranium species.** Seaborg, G.T. (Lawrence Berkeley Lab., CA (USA)). Jan 1983. Contract AC03-76SF00098. 39p. (CONF-830214—1). NTIS, PC A03/MF A01. Order Number DE83006967.

From Workshop on future directions in transplutonium element research; Washington, DC, USA (28 Feb 1983).

In this short review, I shall describe the special aspects of heavy ion nuclear reaction mechanisms operative in the transuranium region, the role of new techniques, possible nuclear reactions for the production of additional transuranium elements and nuclear species and the importance of work in this region for the development of nuclear models and theoretical concepts. This discussion should make it clear that a continuing supply of leements and isotopes, some fo them relatively short-lived, produced by the HFIR-TRU facilities, will be a requirement for future synthesis of new elements and isotopes.

22393 **Possible ground-state octupole deformation in ^{229}Pa.** Ahmad, I.; Gindler, J.E.; Betts, R.R.; Chasman, R.R.; Friedman, A.M. (Chemistry Division, Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review Letters;* **49**: No. 24, 1758-1761(13 Dec 1982). Contract W-31-109-ENG-38.

Evidence is presented for the occurrence of a $(5/2)^{+-}$ parity doublet as the ground state of ^{229}Pa, in agreement with a previous theoretical prediction. The doublet splitting energy is measured to be 0.22 +- 0.05 keV. The relation of this doublet to ground-state octupole deformation is discussed. .ID LV2109 .PG 1762 1764

22394 **Breaking of intrinsic reflections symmetry in nuclear ground states.** Leander, G.A.; Sheline, R.K. (Florida State Univ., Tallahassee (USA)); Moeller, P.; Olanders, P.; Ragnarsson, I. (Lund Inst. of Tech. (Sweden)); Sierk, A.J. (Los Alamos National Lab., NM (USA)). *Nuclear Physics [Section] A;* **388**: No. 3, 452-476(1 Nov 1982).

Negative-parity excited states of doubly even nuclei have earlier been attributed to vibrational excitations. This paper shows that an interpretation starting from a reflection asymmetric intrinsic state is more appropriate for certain nuclei in the radium region. Theoretical evidence for stable octupole deformation comes from a deformed shell-model calculation in which we use a single-particle potential with a realistic radial shape and a finite-range interaction for the surface energy. The octupole effect systematically improves the agreement between theoretical and experimental masses. The low-lying 0^+ excitations observed in experiment are compatible with the calculated collective octupole potentials. The possibility of obtaining further evidence from the spectroscopy of odd-mass nuclei is considered in an exactly solvable model, which shows that the smaller energy splitting observed in odd-A parity doublets mainly reflects single-particle fragmentation of the collective mode. The systematics of theoretical shell structure and experimental spectroscopy suggests the presence of other regions of octupole collectivity near the limits of stability.

22395 **Measurement of the neutron-induced fission cross section of /sup 232/Th relative to /sup 235/U from 0.7 to 30 MeV.** Behrens, J.W.; Browne, J.C.; Ables, E. (Lawrence Livermore Natl Lab, CA, USA). *Nuclear Science and Engineering;* **81**: No. 4, 512-519(Aug 1982).

The fission cross-section ratio /sup 232/Th:/sup 235/U has been measured as a function of neutron energy from 0.7 to 30 MeV using ionization fission chambers, the threshold cross-section method, and the time-of-flight technique at the Lawrence Livermore National Laboratory 100-MeV electron linear accelerator. The measured cross-section ratio, averaged over the neutron energy interval from 1.75 to 4.00 MeV, was 0.1086 /plus or minus/ 0.0024. 29 refs.

22396 **Calculated beta-spectra from decay of fission products produced by thermal-neutron fission of ^{235}U.** Dickens, J.K. (Oak Ridge National Lab., TN (USA)). *Physics Letters, [Section] B;* **113**: No. 3, 201-204(17 Jun 1982).

Beta-ray spectra from decay of fission products created by thermal-neutron fission of ^{235}U have been calculated using summation techniques and using an independently created beta-ray data file. The calculated beta-ray spectra are in very good agreement for Esub(β) approx. equal to 1 to 8 MeV with recently measured spectra of beta rays for two very different exposure and counting time conditions: (a) an 'instantaneous' spectrum following a 1.5 day exposure, and (b) an 8 s counting-time spectrum obtained 1.7 s following a 1 s exposure of ^{235}U by thermal neutrons.

22397 **(DOE/ER/03463—91) Theory of heavy-ion collisions. Final report.** Sperber, D. (Rensselaer Polytechnic Inst., Troy, NY (USA)). Dec 1982. Contract AC02-76ER03463. 27p. NTIS, PC A03/MF A01. Order Number DE83007974.

The main object of the research program was to better our understanding of the mechanism and dynamics of heavy-ion reactions. Some of the ideas are equally applicable to fission. Therefore, in some cases we also undertook the study of fission. The work can be divided into the following categories: (1) statistical study of highly excited states with high spin and studies of isomer ratios for spin and shape isomers; (b) dynamical models for fusion; (c) dynamical models for damped collisions; (d) pre-equilibrium aspects of heavy ion collisions; and (e) pion emission in relativistic heavy-ion collisions.

22401 (LA—9572-C-Vol.1, pp 88-105) **Δ isobars in nuclei.** Toki, H. (Michigan State Univ., East Lansing). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

Δ isobars play important roles in many places in nuclear physics. As an example, the role of Δ isobars on pion absorption with the pion energy being in the resonance region is discussed. In addition to the standard two nucleon mechanism, a new process where two Δ isobars are excited following Δ isobar formation after pion absorption is proposed and claimed to be the dominant absorption process in heavy nuclei.

22402 (LA—9572-C-Vol.1, pp 250-269) **Nuclear chemistry at LAMPF II.** Liu, L.C. (Los Alamos National Lab., NM). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

The availability at LAMPF II of a pion beam at energies substantially higher than those currently produced at LAMPF, and of other high-intensity particle beams, such as kaons and antiprotons, will offer vast new research possibilities not only in studying nuclear structure, but also in investigating many elementary strong interaction processes by using the nucleus as a laboratory. In the following, I discuss a number of new research programs which merit special attention. In our nuclear chemistry studies, we emphasize direct determination of dynamical properties of the final nuclei in a nuclear reaction. In general, these studies, though of a more inclusive character, can be carried out with high efficiency and will provide information which can serve as a guide for the planning of more elaborate investigations.

22403 (LA—9572-C-Vol.1, pp 327-345) **Possible investigations of the (K^-, K^+) reaction.** Hungerford, E. (Univ. of Houston, TX). Nov 1982. NTIS, PC A18/MF A01.

From 2. LAMPF workshop; Los Alamos, NM, USA (19 Jul 1982).

The (K^-, K^+) reaction is most easily visualized as occurring through a one or two step process. The Xi may in turn interact with nucleons so that Xip $\rightarrow \Lambda\Lambda$. Cross sections for such reactions have been calculated recently and representative examples are shown. Estimates of the quasi-free background are also shown. The physics expectations of such investigations are discussed under separate sections for Xi hypernuclei, ΛΛ hypernuclei, and the $s = -2$ dibaryon. Experimental investigations of (K^-, K^+) reactions require intense kaon beams between 1 to 2 GeV/c with a missing mass resolution on the order of 3 MeV. Present kaon facilities with these requirements are marginal or non-existent. Thus some effort is needed in beam design before such a program could begin. However, to fully study doubly strange systems much more intense secondary beams such as those produced at a kaon factory will be necessary.

22404 **Statistical spectroscopy.** French, J.B.; Kota, V.K.B. (Department of Physics and Astronomy, University of Rochester, Rochester, New York 14627). *Annual Review of Nuclear Science;* 32: No. 1, 35-64(1982).

Microscopic methods based on the central limit theorem are reviewed. (AIP)

22405 **Theory of giant resonances.** Goeke, K.; Speth, J. (Institut fuer Kernphysik, Kernforschungsanlage Juelich, D-5170 Juelich, West Germany). *Annual Review of Nuclear Science;* 32: No. 1, 65-115(1982). Contract AC02-76ER13001.

The Random Phase Approximation is used to discuss giant resonances. Sum Rules are considered in detail. (AIP)

22406 **Macroscopic approach to nuclear masses and deformations.** Myers, W.D.; Swiatecki, W.J. (Nuclear Science Division, Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Annual Review of Nuclear Science;* 32: No. 1, 309-334(1982). Contract W-7405-ENG-48.

Binding energy calculations are considered based on the liquid drop model. (AIP)

22407 **Relativistic nuclear collisions in perspective.** Gyulassy, M. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). *Comments on Nuclear and Particle Physics;* 10: No. 2, 69-78(May 1981).

Recent developments in the use of relativistic nuclear collisions to explore the properties of highly excited and dense nuclear matter are reviewed. Methods of determining the nuclear-matter equation of state (energy per baryon) at fixed density and temperature and the results of searches for new collective degrees of freedom or new phases of nuclear matter at high temperature and density, are examined.

22408 **Theory and applications of moment methods in many-fermion systems.** Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980). 511p. (CONF-790959—). . Contract AC02-79ER10403.

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

Separate abstracts were prepared for 22 of the 26 papers presented. Four papers were previously included in the data base. (WHK)

22409 **Nuclear level densities in astrophysics.** Woosley, S.E. (Univ. of California, Santa Cruz). pp 61-79 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

The use of statistical nuclear level densities in astrophysics is briefly reviewed. Particular attention is given to the role of nuclear level density formulae in cross-section calculations for nucleosynthesis studies and to the effects of an assumed Fermi-gas model upon the properties of matter at very high temperature. The use of β-strength functions in astrophysics is also briefly summarized.

22410 **Phenomenological approach to nuclear level densities.** Reffo, G. (Comitato Nazionale per l'Energia Nucleare, Bologna, Italy). pp 167-190 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

The topic of nuclear level densities is considered from the standpoint of applications. A phenomenological approach is described in which relevant parameters are derived from known experimental quantities. Parameter systematics have been determined which may be used for interpolation where experimental information is not available.

22411 **Polynomial expansions and transition strengths.** Draayer, J.P. (Louisiana State Univ., Baton Rouge). pp 213-233 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

The subject is statistical spectroscopy applied to determining strengths and strength sums of excitation processes in nuclei. The focus will be on a ds-shell isoscalar E2 study with detailed shell-model results providing the standard for comparison; similar results are available for isovector E2 and M1 and E4 transitions as well as for single-particle transfer and β^{+-} decay. The present study is intended to serve as a tutorial for applications where shell-model calculations are not feasible. The problem is posed and a schematic theory for strengths and sums is presented. The theory is extended to include the effect of correlations between H, the system Hamiltonian, and θ, the excitation operator. Associated with correlation measures is a geometry that can be used to anticipate the goodness of a symmetry. This is illustrated for pseudo SU(3) in the fp-shell. Some conclusions about fluctuations and collectivity that one can deduce from the statistical results for strengths are presented. (WHK)

22412 **Moment methods and Lanczos methods.** Whitehead, R.R. (Univ. of Glasgow, Scotland). pp 235-255 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

In contrast to many of the speakers at this conference I am less interested in average properties of nuclei than in detailed spectroscopy. I will try to show, however, that the two are very closely connected and that shell-model calculations may be used to give a great deal of information not normally associated with the shell-model. It has been demonstrated clearly to us that the level spacing fluctuations in nuclear spectra convey very little physical information. This is true when the fluctuations are averaged over the entire spectrum but not if one's interest is in the lowest few states, whose spacings are relatively large. If one wishes to calculate a ground state (say) accurately, that is with an error much smaller than the excitation energy of the first excited state, very high moments, μ/ sub n/, n ~ 200, are needed. As I shall show, we use such moments as a matter of course, albeit without actually calculating them; in fact I will try to show that, if at all possible, the actual calculations of moments is to be avoided like the plague. At the heart of the new shell-model methods embodied in the Glasgow shell-model program and one or two similar ones is the so-called Lanczos method and this, it turns out, has many deep and subtle connections with the mathematical theory of moments. It is these connections that I will explore here.

22413 **Beta decay and strength distributions.** Hardy, J.C. (Chalk River Nuclear Labs., Ontario). pp 389-404 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

With the increasing accessibility of nuclei far from stability, experimenters find themselves faced more and more often with complex β-decay schemes: nuclei with over 5 MeV of β-decay energy, exhibiting hundreds and perhaps thousands of transitions. A detailed level-by-level exposition of such schemes - for example, by studying β-delayed γ-rays - is at best prohibitively time consuming, and at worst actually impossible with current techniques. Furthermore, even if reliable schemes are obtained experimentally, their confrontation with theory is severely limited by the absence of theories sufficiently complete to account for such complex spectra. From both points of view, experimental and theoretical, there is strong motivation to find a broader perspective, emphasizing these general features without being overwhelmed by a proliferation of detail. Similar difficulties in the field of slow neutron spectroscopy led, decades ago, to the development of statistical techniques, which more recently have been applied to β-decay. In essence, these place significance on the observed transition probability per energy interval - the β strength function - rather than per energy level. This approach at once makes experiment more tractable, and provides a convenient basis for comparison with theory. What is done here is to describe the data that are now available, suggest which are most likely to be reliable, and outline the methods that are currently used in their analysis. (WHK)

22414 **Study of effective interactions and models in nuclei using the moment method.** Parikh, J.C. (Physical Research Lab., Ahmedabad, India). pp 405-422 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

Theoretical investigation of nuclear properties almost always involves the use of approximate schemes. A common starting point in many of these studies is the shell-model which describes a nucleus as a system consisting of m active nucleons in a N-dimensional single-particle space having an effective (1+2)-body Hamiltonian H. The Schrodinger equation in such a case reduces to a matrix (diagonalization) problem. The dimensionality of the matrix increases very rapidly with m and N. As a result, numerical computations become very large and hence additional approximations have to be used. One approach is to invoke symmetries like space symmetry and SU(3) in light nuclei so that there is a substantial reduction in the size of the many-particle vector space. Another approach which is more widely applicable is the variational one and in particular the Hartree-Fock (HF) approximation. Here the ground state is approximated by a single determinantal wave function having the lowest energy. In most of these applications the effective two-body interaction is chosen to be either a phenomenological one or a realistic one deduced from the free nucleon-nucleon interaction. It is of interest to study the nature of the Hamiltonian operator H under the group transformations which define the model in such spectroscopic spaces - i.e., a tensor decomposition of the interaction under the appropriate group is carried out. From this one would know about the different possible tensor components of H and their relative importance. One would also learn about symmetry breaking-its nature and the tensor components which lead to the breaking. Work done for effective interactions decomposed according to irreducible tensors under the transformations generated by the HF s.p. basis as well as the space symmetry is described.

22415 **Realistic Hamiltonians for no-core moment method studies.** Vary, J.P. (Ames Lab., IA). pp 423-436 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

Motivated by the need to test the adequacy of realistic nucleon-nucleon potentials for yielding the dynamics of many-nucleon systems we develop effective Hamiltonians for large-space moment method studies. These Hamiltonians consist of the relative kinetic energy operator and an exact Brueckner G-matrix acting between all pairs of nucleons in the nucleus. That is, there is no core and the nuclear properties are obtained through moment methods as a function of the size of the model space. The primary initial emphasis is to obtain the binding energy and comparisons are made with results of the coupled-cluster or exp(s) calculations. We find a systematic but slow decrease in the importance of three and higher body effective forces as the model space is increased. The results with the Reid soft core interaction for the binding energy of ^{16}O appear to be converging close the the exp(s) results. Further tests of the moment methods themselves are indicated as well as the desirability of increasing still further the model space for the no-core studies.

22416 **Fixed-J moments: exact calculations.** Jacquemin, C. (Universite de Paris-11, Orsay, France). pp 437-450 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

We show that the two first fixed J moments of the Hamiltonian operator can be easily calculated over the whole fixed particle number shell model space as well as over configurations. The method may be extended to higher moments of H and to include the isotopic spin T.

22417 **Radial densities of nuclear matter and charge via moment methods.** Dalton, B.J. (Ames Lab., IA). pp 451-462 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980). Contract W-7405-ENG-82.

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

In this report I will discuss some initial efforts in our program to describe radial densities of nuclear matter and charge with the use of moment methods. A brief introduction to trace reduction formulas and computation problems along with proposed methods to overcome them will be given. This will be followed by a general discussion on computation of expectation values using moment methods with particular emphasis on formulation for the radial density applications.

22418 **Sum-rules, strength distributions and giant resonances.** Bohigas, O. (Institut de Physique Nucleaire, Orsay, France). pp 463-499 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

It is well known that atomic nuclei show collective properties. One important aspect of collective motion is the concentration in energy of excitation strength. This is best illustrated by the nuclear photo effect which has the following two main characteristics: (1) the photoabsorption cross-section shows, all over the periodic table, a broad peak that takes a large part of the integrated photo cross-section; (2) the variation of the peak energy is a smooth function of the mass number A. Two main routes can be followed in order to describe such a behavior: (1) the more detailed, in which the strength function S(E) is calculated at all energies E, and

(2) a more global in which only some energy moments of the strength function S(E) are computed. The purpose of this talk is to describe some methods and applications corresponding mainly to the second route. A description of the strength distribution by its energy moments or sum-rules will be especially suited when the excitation strength is highly collective, in which case one can hope that the knowledge of a very limited number of moments will give the salient features of S(E). Would S(E) have a complicated structure as a function of E then many moments would be required in order to reproduce its properties.

22419 **(AD-A—118299/7) Improved treatment of multiple scattering of intense charged particle beams. Interim report.** Hughes, T.P.; Godfrey, B.B. (Mission Research Corp., Albuquerque, NM (USA)). Jul 1982. 31p. NTIS, PC A03/MF A01.

The scattering of self-pinched particle beams propagating in gas is investigated using Moliere's treatment of multiple scattering. Nordsieck lengths significantly longer than those predicted on the basis of less accurate scattering formalisms are obtained numerically. An improved analytic-expression for the Nordsieck length is derived and agrees well with the numerical results. Experimental data on the beam expansion from the PHERMEX and ASTRON experiments show good agreement with numerical simulations and analytic results.

22420 **(ANL/NESC—28) FOG; one-dimensional few-group few-gp diffusion slab cylinder sphere.** Brunnenmeyer, R.L.; Mickle, R.A. (Bechtel Corp., San Francisco, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048028.

Input data must be macroscopic. Scattering is limited to the next lower group. 1 to 4 energy groups are permitted.

The FOG program solves the one-dimensional few-group diffusion equations in any of three geometries slab, cylinder, or sphere. Provisions are made for calculating the flux, the adjoint flux, and various criticality searches as well as a buckling iteration and automatic Tschebyscheff polynomial computation of source extrapolation factors.GE625; FORTRAN IV.

22421 **(ANL/NESC—29) AIM6; one-dimensional multigroup diffusion slabs, cylinders, and spherese.** Nakamura, S.; Bennedict, W. (Ohio State Univ., Columbus (USA). Dept. of Nuclear Engineering). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048029.

AIM6 solves the one-dimensional multigroup diffusion equations utilizing a microscopic cross section library. Any of three geometries are available slab, cylinder, or sphere. Criticality searches are provided including a concentration search on one or two elements. Homogeneous and inhomogeneous problems may be solved with a variety of boundary condition options.IBM370; FORTRAN IV; OS/370; 300K bytes and 1 scratch unit.

22422 **(ANL/NESC—30) PERT; one-dimensional perturbation for AIM and FOG codes.** Gowins, G. (Boeing Co., Huntsville, AL (USA). Boeing Huntsville Simulation Center). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048030.

PERT is a perturbation program designed for use with the AIM6 and FOG programs. Punched card output from these codes is used as input to PERT. Using cross-section data, fluxes, and adjoint fluxes, the relative change in keff can be calculated. Cross sections may be weighted with the adjoint flux and/or direct flux. The neutron lifetime for the delay groups may also be determined.IBM360; FORTRAN IV.

22423 **(ANL/NESC—39) EQUIPOISE3; two-dimensional, two group diffusion is slabs or cylinders.** Wang, C.L. (Institute of Nuclear Energy Research, Lung-Tan (Taiwan)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048039.

EQUIPOISE3 solves the two-group, two-dimensional, neutron diffusion equations in cylindrical or slab geometry.CDC CYBER73,175;CDC7600; FORTRAN IV; NOS/BE 1.2, 1.3 (CDC CYBER73), SCOPE 2.1 (CDC7600); 125,000 (octal) words of memory are required for execution.

22424 **(ANL/NESC—50) TEMPEST2; thermal neutron spectrum cross sections.** Gowins, G. (Boeing Co., Huntsville, AL (USA). Boeing Huntsville Simulation Center). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048050.

TEMPEST2 is a neutron thermalization program based upon the Wigner-Wilkins approximation for light moderators and the Wilkins approximation for heavy moderators. A Maxwellian distribution may also be used. The model used may be selected as a function of energy. The second-order differential equations are integrated directly rather than transformed to the Riccati equation. The program provides microscopic and macroscopic cross-section averages over the thermal neutron spectrum.IBM360; FORTRAN IV; OS/360.

22425 **(ANL/NESC—51) FORM; fast neutron spectrum cross section calculations.** Nakamura, S.; Kazemersky, P. (Ohio State Univ., Columbus (USA). Dept. of Nuclear Engineering). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048051.

The FORM, or FORTRAN-MUFT, program is a Fourier transform slowing-down code. A library tape containing 54-group microscopic cross sections, resonance parameters, inelastic scattering matrices, and source spectra is used to generate a 54-group flux spectrum and few-group constants.IBM370; FORTRAN IV; OS/370; 200K bytes storage.

22426 **(ANL/NESC—58) SIZZLE; one-dimensional multigroup diffusion depletion.** Blaine, R.A. (Atomics International, Canoga Park, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048058.

SIZZLE solves the one-dimensional, multigroup burnup problem in the diffusion theory approximation for fast intermediate reactors. After the initial calculation at t=0, average cross sections are computed for further calculations using one to six energy groups. Criticality may be maintained by use of a concentration search. The concentration of the various isotopes is permitted to vary only from region-to-region. Chains included are Th232, U238, and a fission product poison chain.IBM360; FORTRAN IV; OS/360.

22427 **(ANL/NESC—120) FAIMOS; one-dimensional, multigroup diffusion in slab, cylindrical, or spherical geometries .** Cockrell, R.G. (Boeing Co., Huntsville, AL (USA). Boeing Huntsville Simulation Center). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048120.

FAIMOS is a multigroup theory, one-dimensional neutron diffusion equation program based on AIM6 (NESC Abstract 29). The principal features are - (a) three geometries (planar, cylindrical, or spherical), (b) calculation of fluxes and multiplication factor, (c) one-iteration problems, (d) choice of one of five sets of boundary conditions at both the inner and outer boundaries, (e) criticality searches on transverse buckling, homogeneous poison, critical radius, location of a poison region boundary, location of a fuel region boundary, (f) adjoint flux calculation, and (g) extensive data edit.IBM360; FORTRAN IV (H); OS/360.

22428 (ANL/NESC—147) **AILMOE; cross section calculation of elastic scattering resonancess.** Blaine, R.A. (Atomics International, Canoga Park, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048147.

AILMOE is a modified form of the ANL ELMOE program. The Fourier transform of the fast neutron flux is found for a mixture of moderators heavier than hydrogen with the moderator scattering law rigorously accounted for.IBM360; FORTRAN IV (H); OS/360; Minimum of 256K bytes.

22429 (ANL/NESC—156) **EXTERMINATOR2; two-dimensional, multigroup diffusion program diffusion program.** Fowler, T.B.; Tobias, M.L.; Vondy, D.R. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048156.

Since FORTRAN IV variable-dimensioning techniques were used in EXTERMINATOR2, the only restriction on problem size is the available core storage. The code examines the problem size and stores fluxes and equation coefficients (except for scattering matrix coefficients which are recalculated at each iteration) according to the machine core size in one of four ways - (1) All fluxes and equation coefficients are contained in core and no I/O devices are used during the iterative part of the calculation. (2) All equation coefficients are contained in core and I/O devices are used to store the fluxes. (3) The fluxes are contained in core and I/O devices are used to store the equation coefficients. (4) Both coefficients and fluxes are used from I/O devices.

The multigroup, two-dimensional neutron diffusion equations are solved in x-y, r-z, or r-theta geometry.IBM360;GE625;CDC6600; FORTRAN IV; OS/360 (IBM360), GECOS (GE625), and SCOPE (CDC6600); A machine with a minimum of about 64K words of core storage and 5 I/O devices for temporary storage in addition to those for input data and printed output. Some problems may require 4 additional I/O devices.

22430 (ANL/NESC—173) **2DF; two-dimensional, multigroup discrete ordinate code.** Archibald, R.J. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048173.

Storage restrictions are specified by a complicated equation involving SN order, number of materials, mesh intervals, and energy groups, and specified boundary conditions.; Source deck (3711 cards) Sample problem (882 cards) Reference Notes and Inter-office Memoranda.

2DF is a two-dimensional, multigroup program written in FORTRAN for solving the neutron transport equation using the SN method. The program can determine the real or adjoint solution for x-y, r-z, or r-theta geometry. Isotropic, or a form of linear anisotropic, scattering may be considered. Various boundary conditions are allowed. The program also contains a number of search options whereby one can vary dimensions or concentrations to arrive at a predetermined eigenvalue. A distributed source may be specified. A library of cross sections is available on magnetic tape. Cross sections may be read from the library tape and/or from cards.UNIVAC1108; FORTRAN V; EXEC8.

22431 (ANL/NESC—185) **GAMTEC2; multigroup constant calculations for 0 to 10 MeV.** Carter, L.L.; Richey, C.R. (Pacific Northwest Lab., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048185.

The maximum number of concentric regions in the unit lattice cell is 16. Each region may contain up to 10 isotopes. Group constants may be computed for one thermal group and from 1 to 34 epithermal groups .

GAMTEC2 generates multigroup constants in the energy range from 0 to 10 MeV for either homogeneous mixtures or heterogeneous arrays consisting of cylinderized lattice cells. The thermal group constants are averaged over (1) Wigner-Wilkins light moderator spectrum, (2) Wilkins heavy moderator spectrum, or (3) a Maxwellian distribution. For heterogeneous arrays the spatial thermal flux is calculated by a monoenergetic P3 approximation. For epithermal energies, the slowing-down distribution is described by either a B1 or P1 approximation to the Boltzmann equation. Resonance absorption and fission are treated by the Adler-Nordheim method. An improved method over that used in GAM1 for averaging the resonance absorption contribution to the multigroup constants is included. Fuel lumping effects on the fast fission of U238 and Th232 are treated by an n-flight collision probability technique. Group constants are punched on cards in HFN (diffusion code) and DTF (SN transport code) formats.UNIVAC1107;GE625;CDC6400; FORTRAN IV; EXEC2 (UNIVAC1107) and SCOPE 3.4 (CDC6400); The code requires the use of 2 tape units in addition to the usual input and output units - one for the single data library tape and one for temporary storage. Also, an on-line card punch or tape for punch output is required. The CDC6400 version uses disk as scratch storage.

22432 (ANL/NESC—209) **DTF4; one-dimensional, multigroup discrete ordinate program.** Lathrop, K.D. (Los Alamos Scientific Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048209.

The variable dimensioning capability of FORTRAN IV has been utilized so that any combination of number of groups, number of spatial intervals, size of angular quadrature, etc., can be used that will fit within the total core storage available to a user. The code itself requires about 8000 words, but it can be shortened by deleting certain subroutines which perform optional calculations.

The linear, time-independent, Boltzmann equation for particle transport is solved for the energy space, and angular dependence of the particle distribution in one-dimensional slabs, cylinders, and spheres. Independent source or eigenvalue (multiplication, time-absorption, element concentration, zone thickness or system dimension) problems are solved subject to vacuum, reflective, or periodic boundary conditions. A complete energy-transfer scattering matrix is allowed for each Legendre component of the scattering cross section matrices.IBM360;CDC6600;GE625; FORTRAN IV (CDC6600), FORTRAN IV and MAP (GE625), FORTRAN IV and BAL (IBM360); OS/360 (IBM360), and SCOPE (CDC6600); No disks or tapes are used. A clock is used but, by removing a few program statements, this requirement can be eliminated.

22433 (ANL/NESC—212) **VARI-QUIR; time-dependent, two-dimensional, multigroup diffusion .** Collier, G. (Westinghouse Electric Corp., Large, PA (USA). Astronuclear Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048212.

Maxima of - 4 groups 6 precursor groups 36 regions 20 different materials; Source decks (6600-2012 cards, 360-1896 cards) Sample problems (6600-74 cards, 360-88 cards) Reference report and Note.

The time-dependent, multigroup, two-dimensional neutron diffusion equations are solved in x-y or r-z geometry.CDC6600;IBM360; FORTRAN IV; SCOPE (CDC6600) and OS/360 (IBM360).

22434 (ANL/NESC—216) **FSDP3; pointwise cross sections from Breit-Wigner parameters.** Mathews, D.R. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048216.

The maximum number of neutron energies is 5000 when the ENDF/B format input option is used and limited only by computing time considerations otherwise. A maximum of 3000 resonances per l-J state may be used with the ENDF/B format input option and 3000 s-wave resonances with the old input format. The number of resonances to be considered on each side of each neutron energy may be the same as the total number of resonances per l-J state except when the multilevel Breit-Wigner scattering option is used in which case a maximum of 100 resonances per l-J state on each side is allowed. Relative orbital angular momentum values l greater than 3 are not allowed (l=0 is an s-wave interaction). The mathematical assumptions needed to express the results in terms of the conventional Doppler line shape functions may be invalid at very low neutron energies. The basic formulation is incomplete for the very high temperatures attainable in stars or in nuclear explosions.

FSDP3 computes pointwise cross sections from single-level Breit-Wigner resonance parameters.UNIVAC1108; FORTRAN V; EXEC8; 50,511 (decimal) words for data storage plus 7995 words for instructions, an optional cross section output tape, and 2 scratch files (tape or drum) are required.

22435 (ANL/NESC—222) GAMBLE5; two-dimensional, multigroup diffusion in xy and rz geometry. Dorsey, J.P.; Froehlich, R. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048222.

Maxima of - 10 energy groups 255 different material regions 20,000 space mesh points (16,043 cards) .

The homogeneous 2-dimensional multigroup diffusion theory equations with arbitrary group-to-group scattering and arbitrary fission transfer are solved for heterogeneous assemblies in x-y and r-z geometry. Homogeneous logarithmic boundary conditions are used at the outer surface of the assembly and at the surface of non-diffusion regions. The results include the group and point-dependent neutron fluxes, the power distribution, the neutron multiplication factor (k-effective), and a detailed neutron balance.UNIVAC1108; FORTRAN IV and Assembly language; VERSION IX and EXEC2, GAX23; 65,536 words of core storage and 3 tape units on one data channel, 1,572,864 words of FH-880 drum storage from one data channel, and a peripheral printer.

22436 (ANL/NESC—241) HFN; one-dimensional, multigroup diffusion in slabs, cylinders, and spheres. Lilley, J.R. (Hanford Engineering Development Lab., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048241.

Greater than Less than Number of or equal to or equal to energy groups 2 20 regions 1 50 materials 1 100 group parameters 3500 groups* mesh points 2100.

HFN solves the homogeneous or inhomogeneous one-dimensional multigroup diffusion equation for its lowest eigenvalue and the corresponding direct and/or adjoint eigenvectors. Inhomogeneous boundary conditions and a flexible scatter-transfer matrix structure are included. Optional calculations include criticality searches, detector activation traverses, and integrals for perturbation theory analysis.UNIVAC1107;CDC6600,CYBER74; FORTRAN IV (99.9%) and SLEUTH-II (0.1%) (UNIVAC1107), FORTRAN IV (CDC6600); CSC EXEC2 Package B (UNIVAC1107), SCOPE 3.4 (CDC6600); 64K UNIVAC1107 with 786,432 word drum (exclusive of system requirements), a tape unit, on-line printer, card reader and clock. The CDC version requires 122K (octal) words of memory.

22437 (ANL/NESC—247) FLANGE1; scattering law cross section calculation. Borgonovi, G.M. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048247.

FLANGE1 computes neutron scattering kernels for a large class of moderators. Neutron scattering kernels are obtained from the scattering law computed by the code GASKET. FLANGE1 allows the calculationsulation of double differential cross sections, angular cross sections, total cross sections, and Legendre moments of the scattering kernel. The short collision time approximation is used for energy transfers larger than the maximum provided by GASKET.UNIVAC1108; FORTRAN V; EXEC2; 32K memory, 2 magnetic tapes, one scratch unit.

22438 (ANL/NESC—259) MUSCAT; view factor shielding code cavity geometry. Gerber, M.J.; Roos, B.W. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048259.

MUSCAT computes the incident scattered neutron currents as a function of position within (1) the cavity formed by two truncated concentric spheres, (2) the cavity between two concentric circular cylinders, or (3) a cylindrical cavity.UNIVAC1108; FORTRAN IV; EXEC2; 32K memory.

22439 (ANL/NESC—262) MACH1; one-dimensional, multigroup diffusion is slabs, cylinders, and spheres. Ott, K.O. (Purdue Univ., Lafayette, IN (USA). Dept. of Nuclear Engineering). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048262.

Maxima of - 20 spatial regions 150 mesh points 28 energy groups 5 modal spectra (IBM360 version) 15 downscatter groups 20 isotopes per problem 20 homogenized materials 20 isotopes per homogenized material A special scatter treatment is used which allows full downscatter for hydrogen isotopes .

MACH1 performs one-dimensional multigroup diffusion solutions and associated calculations, including criticality searches, perturbation, reaction summary, beta effective, group collapsing, and pointwise reaction rates and ratios. Several card dumps of computed data are available on option. A spectral synthesis option is available in the IBM version.CDC6500;IBM360,370/195; FORTRAN IV (CDC6500, IBM360-98%), BAL (IBM360-2%); OS/360 (IBM360) and SCOPE (CDC6500); The IBM360 version uses 5 tape drives and 1645K core storage assuming no overlay organization.

22440 (ANL/NESC—263) GASKET; thermal scattering law calculation. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Naliboff, Y.D. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048263.

Maxima of - 100 points in distributed frequency spectrum 100 points in anisotropic part of the frequency spectrum 2 discrete oscillators if w sub 1 does not equal zero, other- wise 20 20 phonon terms calculated for each delta line.

GASKET calculates the thermal neutron scattering law, s(alpha,beta), for a large class of moderators. Provision has been made in GASKET for the following dynamical modes of the scatterer - (1) free translation (gas), (2) diffusive or Brownian motion, (3) harmonic isotropic vibrations with continuous frequency spectrum, (4) harmonic anistropic vibrations with continuous frequency spectrum (as applied for instance to graphite), (5) harmonic isotropic vibrations with discrete frequency spectrum.UNIVAC1108; FORTRAN IV; EXEC2; 32K machine with about 26K available for the program and one scratch unit (drum, disk, or tape).

22441 (ANL/NESC—270) CAESAR4; liblst; one-dimensional, multigroup diffusion. Blaine, R.A. (Atomics International, Canoga Park, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048270.

Maxima of - 20 regions 20 elements in library 12 elements per material 10 materials 100 intervals 35 groups 10 downscatter groups 20 groups and 15 elements in resonance cross section calculation .

CAESAR4 solves the one-dimensional, multigroup, diffusion equations in any of three geometries and provides a wide choice of boundary conditions, criticality searches, edits and other auxiliary computations.IBM360; FORTRAN IV; OS/360; 256K bytes.

22442 (ANL/NESC—271) CLIP; form or thredes library utility routine. Blaine, R.A. (Atomics International, Canoga Park, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048271.

CLIP is the cross section library preparation and maintenance program for FORM and THREDES.IBM360; FORTRAN IV; OS/360; 256K bytes.

22443 (ANL/NESC—274R) WIGL2; one-dimensional, two-group space-time diffusion. Vota, A.V. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048274.

For the 6600 no restrictions are placed on single parameters related to problem size. The total amount of storage set aside for all parameters is 14,000 memory locations. This allows the user to decide which area requires a more detailed representation. For the 1108 - let i = number of delay groups n = number of compositions ndt = number of changes in time-step size p = number of spatial points k = number of thermal-hydraulic regions r = number of nuclear regions then (3*ndt + (3+i) * r + 40*n + 6*k + (8+i)*p + i) less than or equal to 12,000 and (26*p + r + 16*k + 12) less than or equal to 16,000.

WIGL2 is a one-dimensional two-group space-time diffusion theory program with zero, one, or six delayed neutron groups. The program will treat slab, cylindrical, and spherical geometries and includes non-boiling heat transfer. It accounts for xenon feedback and feedback effects due to fuel and coolant temperature. Control rod motion and control system feedback based on total core power or outlet coolant temperature can be simulated. Transients may be excited by prescribed changes in inlet coolant temperature, coolant flow rate, or rod position.CDC6600;UNIVAC1108;IBM370; FORTRAN IV; SCOPE 2.0 (CDC6600), EXEC 2 GAX27 (UNIVAC1108), and OS/370 (IBM370); On the 6600 WIGL2 requires 130,000 (octal) central memory words and one disk is used for storage of permanent files. The number of central memory words required could be decreased by decreasing the amount of storage set aside for parameters. On the 1108 64K of core memory and 2 tapes (input and output) are used. The 370 version uses 350K bytes of memory and a card punch.

22444 (ANL/NESC—275R) PDQ8;PDQ7; one, two, or three-dimensional, few group. Cadwell, W.R.; Pfeifer, C.J. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048275.

The total number of groups is limited to five, although six equations may be solved if the P(3) option is used. All storage is dynamic so no fixed problem size limits are imposed.

The PDQ series of programs is designed to solve the neutron diffusion-depletion problem in one, two or three dimensions. Very large problems can be accommodated. The three-dimensional spatial calculation may be either explicit or discontinuous trial function synthesis. Up to five lethargy groups are permitted. The fast group treatment may be simplified P(3), and the thermal neutrons may be represented by a single group or a pair of overlapping groups. Adjoint, fixed source, one iteration, additive fixed source, eigenvalue, and boundary value calculations may be performed. The programs utilize the HARMONY system to allow for time-dependent representation of cross section variation and generalized depletion chain solutions. In PDQ8 the depletion is a combination gross block depletion for all nuclides as well as a fine block depletion for a specified subset of the nuclides. The geometries available include rectangular, cylindrical, spherical, hexagonal, and, in PDQ8 only, a very general quadrilateral geometry with diagonal interfaces. All geometries allow variable mesh in all dimensions. Various control searches as well as temperature and xenon feedbacks are provided.CDC7600,6600,CYBER175,170;IBM360; PDQ8 - FORTRAN and COMPASS (RUN and FTN compatible); PDQ7 - FORTRAN IV and COMPASS (CDC CYBER175), FORTRAN FTN4.6 (CDC7600), FORTRAN IV (H) and BAL (IBM360); PDQ8 - SCOPE 1.1 (CDC7600), SCOPE 3.3 (CDC6600); PDQ7 - NOS 1.2 (CDC CYBER175), SCOPE 2.1.4 (CDC7600), OS/360 (IBM360); On CDC systems the central memory size should be at least 65K, the program will utilize up to 1000K of extended core memory, and up to four disks transferring in parallel. The IBM360 version of PDQ7 requires at least 400K bytes of memory and auxiliary disk storage (Models 2314 or 3330).

22445 (ANL/NESC—276) AVOID; annular void cross section calculation. Henderson, W.B. (General Electric Co., Cincinnati, OH (USA). Nuclear Materials and Propulsion Operation). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048276.

AVOID computes the equivalent diffusion coefficient and loss cross section of an annular void in a cylindrical reactor and the radial flux distribution in the void.GE625; FORTRAN IV; GECOS; 12K core memory exclusive of system use.

22446 (ANL/NESC—280R) M0807; two-dimensional diffusion absorption removal cross sections. Rutherford, C.H. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048280.

Two geometries are permitted, rectangular and 60-degree parallelogram. In rectangular geometry 70x70 mesh points are permitted and 60x60 for parallelogram geometry. As many as 99 compositions are allowed per problem .

M0807 solves the two-dimensional fixed-source diffusion equation for the absorption and removal macroscopic cross sections required to yield a specified reaction rate distribution.CDC6600; FORTRAN IV; SCOPE 2.0; 64K core storage, card reader, printer, and one auxiliary storage unit.

22447 (ANL/NESC—287) BISYN; two-dimensional, multigroup diffusion synthesis calculations. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Duncan, W.A. (General Electric Co., San Jose, CA (USA). Nuclear Energy Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048287.

Maximum number of regions in each dimension = 8. Maximum number of mesh points in each dimension = 75. Maximum number of energy groups = 16. Maximum downscatter = 8.

BISYN solves the two-dimensional, multigroup, neutron diffusion equations in x-y or r-z geometry using a noniterative synthesis method. This approach is designed to greatly reduce the computer cost of running two-dimensional multigroup problems at the risk of some loss in accuracy of the detailed flux distribution.GE635;UNIVAC1108; FORTRAN IV; GECOS III, SDL1 (GE635) and EXEC2 (UNIVAC1108); 47,000 words of memory, disk, drum, and 2 tapes for the GE635. 54K of fast memory, 2 tape drives, 510,000 words of peripheral storage and the ability to segment for the UNIVAC1108.

22448 (ANL/NESC—289) GAKER; inelastic scattering cross section calculations for moderators. Houston, D.H. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048289.

Maxima of - 75 energies 30 scattering angles 2 Legendre moments of the scattering kernel 3 vibrational oscillators Only the latter may not be easily changed.; Source deck (390 cards) Sample problem (15 cards) Reference report, GA-5798 pp. 155-162, and Note.

The GAKER code evaluates the inelastic, double-differential neutron scattering cross sections for moderators with phonon spectra which can be represented as sums of delta-functions. It is based on the original model for light water by Nelkin, which consisted of a translator, a hindered rotator (treated as an isotropic oscillator), and several vibrational oscillators. The code has been modified several times to include more oscillators and to treat anisotropic effects. Final energy-integrated cross sections are also calculated.UNIVAC1108; FORTRAN IV; EXEC2; 32K memory and 2 scratch files.

22449 (ANL/NESC—291) **HEXSCAT; elastic scattering cross sections hexagonal lattice.** Naliboff, Y.D. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048291.

HEXSCAT calculates P0 through P3 components of the polycrystalline coherent elastic neutron scattering cross section per nucleus for a hexagonal lattice. The code averages point values over input group boundaries to give smoothed group cross sections.UNIVAC1108; FORTRAN IV; EXEC2; 64K storage on the UNIVAC1108.

22450 (ANL/NESC—292) **PSEUDO; statistical resonance parameter calculations.** Mathews, D. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048292.

Resonance parameters are constructed from average nuclear properties in the unresolved resonance region.UNIVAC1108;IBM360; FORTRAN IV; EXEC2 (UNIVAC1108), OS/360 (IBM360); 15K memory.

22451 (ANL/NESC—298) **GGC4; multigroup cross sections fast thermal spectra.** Mathews, D.R. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048298.

Maxima of - 99 fast groups 101 thermal fine groups 99 fast broad groups 50 thermal broad groups 50 broad groups in the combining section 250 resonances per nuclide 2 moderators admixed with a resonance absorber 305 entries in the escape probability table for cylindrical geometries 505 entries in the escape probability table for slab geometries The energy dependence of the input bucklings is restricted to separate energy-independent fast- and thermal-section values (positive, negative or zero values are allowed in either section).

The GGC4 program solves the multigroup spectrum equations with spatial dependence represented by a single input buckling. Broad group cross sections (shielded or unshielded) are prepared for diffusion and transport codes by averaging with the calculated spectra over input-designated energy limits. The code is divided into three main parts. A fast (GAM) section which covers the energy range from 14.9 MeV to 0.414 eV, a thermal (GATHER) section which covers the energy range from 0.001 to 2.38 eV, and a combining (COMBO) section which combines fast and thermal cross sections into single sets. Basic nuclear data for the fast section which consists of fine group-averaged cross sections and resonance parameters is read from a data tape. The fine group absorption and fission cross sections may be adjusted by performing a resonance integral calculation. Utilizing a fission source and an input buckling, the code solves the P1, B1, B2, or B3 approximation to obtain the energy-dependent fast spectrum. Two or six spatial moments of the spectrum (due to a plane source) may also be evaluated. Instead of performing a spectrum calculation, the user may enter the Legendre components of the angular flux directly. For as many input-designated broad group structures as desired, the code calculates and saves (for the combining section) spectrum-weighted averages of microscopic and macroscopic cross sections and transfer arrays. Slowing down sources are calculated and saved for use in the lower energy range. Given basic nuclear data, the thermal section of GGC4 determines a thermal spectrum by either reading it as input, by calculating a Maxwellian spectrum for a given temperature, or by an iterative solution of the P0, B0, P1, or B1 equations for an input buckling.

22452 (ANL/NESC—308) **JUPITOR1;JP1; coupled channel x-sec evaluation.** Garcia de Viedma, L. (NEA Data Bank, 91 - Gif-sur-Yvette (France)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne IL 60539. Order Number DE83048308.

Maxima of six states and 30 partial waves can be coupled at one time. If the projectile energy becomes negative in some excited channels this maximum is reduced to 25 partial waves. The maximum value of the orbital angular momentum is 69. Differential cross sections for up to 100 angles for any number of states can be computed unless a polarized beam or target is considered, in which case the maximum is 35152 and Addenda.

JUPITOR1 is used to perform coupled-channel calculations to evaluate the cross sections for the scattering of nuclear particles by various collective nucleii.IBM360; FORTRAN IV; OS/360; 300K bytes of storage.

22453 (ANL/NESC—310) **GAKIN2; 10 multigroup time-dependent diffusion.** Dugan, E.T. (Florida Univ., Gainesville (USA). Dept. of Nuclear Engineering Sciences). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048310.

Variable dimensioning permits accommodation of any number of energy groups, space points, and material regions, within the limits of available storage. The number of delayed neutron groups is limited to 6. The number of bytes allocated for data storage is a function of the dimension of COMMON block A. The size of A, which is also the value of the variable MAX, must be greater than 8(P(G+D) + 2GD + 10G + G(G+1) + 25R + 19RG + RG**2 + 11P + 4PG + 2N + 50) where R is the number of regions, G is the number of neutron energy groups, D is the number of delayed neutron groups, P is the number of space points, and N is the number of test points for testing convergence and predicting transformation frequencies (recommended value is one or two times the number of material regions, R).

GAKIN2 solves the time-dependent multigroup neutron diffusion equations in one space dimension.IBM370; FORTRAN IV; OS/370; 275K bytes of storage on an IBM370/195.

22454 (ANL/NESC—318) **FEVER7; one-dimensional multigroup diffusion and depletion.** Wagner, M.R. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048318.

Maxima of - 7 energy groups 151 mesh points 20 regions 60 subregions 45 nuclides per subregion fixed sets of heavy nuclides; Source deck (5941 cards) Sample problem (786 cards) Reference reports.

FEVER7 performs a multigroup, 1-dimensional depletion calculation which allows fuel in various stages of irradiation to be homogenized into the same region for purposes of the diffusion calculation but follows the depletion of each of the subregions separately. The calculation may be interrupted periodically for refueling one or more regions. Recycling is optional and there is no limit to the number of refuelings which may be performed. A control poison search is available and concentration dependent self-shielding factors may be applied to a number of lumped poisons.UNIVAC1108; FORTRAN IV; EXEC2; 65K UNIVAC1108 or 1107 and 3 tapes (input, output, system).

22455 (ANL/NESC—319) **GASP7; one-dimensional burnup power distribution search.** Simon, W.A.; Wagner, M.R. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048319.

Maxima of - 7 energy groups 4 thermal neutron energy groups 151 mesh points 20 regions 45 different materials in each region 80 different cross section sets Downscattering from the fast groups into the next lower group only is permitted. The geometry assumed is cylindrical, and either radial or axial flux distributions may be calculated.

GASP7 calculates the one-dimensional distribution of fissile and fertile materials in a nuclear reactor which will yield any desired power distribution during the burnup history of the reactor core. A poison and poison distribution search for a desired multiplication and minimum power distribution perturbation can also be performed.UNIVAC1108; FORTRAN IV; EXEC2; 65K UNIVAC1108 or 1107 and 3 tapes (input, output, system).

22456 (ANL/NESC—320) **TEMCO7; temperature coefficient calculation.** Wagner, M.R. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048320.

Maxima of - 25 temperatures 3 fast energy groups 1-4 thermal energy groups 20 regions 151 mesh points 60 subregions 40 nuclides per subregion 80 cross section sets per temperature.

TEMCO7 computes reactor temperature coefficients.UNIVAC1108; FORTRAN IV; EXEC2; 65K UNIVAC1108 or 1107 and 3 tapes (input, output, system).

22457 (ANL/NESC—325) **2DB; two-dimensional multigroup diffusion and depletion.** Little, W.W.; Hardie, R.W. (Pacific Northwest Lab., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048325.

Since variable dimensioning is employed, no simple bounds can be stated. The current 1108 version, however, is nominally restricted to 50 energy groups in a 65K memory. In the 6600 version the power fraction, average burnup rate, and breeding ratio calculations are limited to reactors with a maximum of 50 zones.

2DB is a flexible, two-dimensional (x-y, r-z, r-theta, hex geometry) diffusion code for use in fast reactor analyses. The code can be used to: (a) Compute fuel burnup using a flexible material shuffling scheme. (b) Perform criticality searches on time absorption (alpha), material concentrations, and region dimensions using a regular or adjoint model. Criticality searches can be performed during burnup to compensate for fuel depletion. (c) Compute flux distributions for an arbitrary extraneous source.UNIVAC1108;CDC6600; FORTRAN IV; 65K memory and three peripheral storage devices.

22458 (ANL/NESC—338R) **TWIGL;TWIGGLE; two-dimensional, two-group space-time diffusion feedback.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy, J.H.; Hageman, L.A. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048338.

Maxima of - 37 spatial mesh points in the x or r direction 37 spatial mesh points in the y or z direction 2 energy groups 6 groups of delayed neutrons 20 difference material compositions 100 thermal-hydraulic regions for which the average tempera-tures are defined.

TWIGL solves the two-dimensional, two-group, space-time neutron diffusion equations in rectangular or cylindrical geometry in the presence of temperature feedback. The neutron diffusion and delayed precursor equations are differenced in both space and time. The thermal-hydraulic description is based on a no-boiling, one-pass model formulated in terms of regionwise-averaged coolant and fuel metal temperatures.CDC6600;IBM360; FORTRAN IV; SCOPE 2.0 (CDC6600) and OS/360; 64K memory.

22459 (ANL/NESC—339) **GAUGE; two-dimensional, few-group, neutron diffusion in hexagonal geometries.** Wagner, M.R. (General Atomic Europe, Zurich (Switzerland)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048339.

Maxima of - 1519 hexagonal fuel or reflector elements 4405 mesh points 4 energy groups with downscattering only into the next lower energy group 280 burnup regions 40 burnable nuclides 80 microscopic cross section blocks 5 variable self-shielding factor tables. The flux is assumed to be zero at the outer reactor boundary.

The two-dimensional few-group neutron diffusion theory equations for a uniform triangular mesh are solved to obtain the multiplication factor and the spatial flux and power distribution of reactors with hexagonal core configuration. Complete reactor life histories with partial refuelling at a number of reload time-points can be calculated. At each discrete time-point a control rod search may be performed to maintain criticality at all times. The depletion scheme of all burnable nuclides is specified by the user at execution time. Three modes of operation are possible - (1) straight burnup calculation, (2) control rod criticality search, allowing the adjustment of a number of control rod banks according to a prescribed rod sequencing scheme, and (3) a series of static calculations with insertion of rods into fixed, prescribed positions.UNIVAC1108; FORTRAN IV; EXEC2 (UNIVAC1108); 65K memory, one drum (or scratch tape) unit, input, output, and restart tapes.

22460 (ANL/NESC—341) **GANDY3; unresolved resonance cross secton calculation.** Koch, P.K.; Mathews, D. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048341.

GANDY3 will handle as many temperatures as desired for a maximum of 100 energy points. Consideration is given to neutron orbital angular momenta through d-wave (L=2).

GANDY3 evaluates temperature-dependent effective neutron capture, fission, and scattering cross sections in the unresolved resonance region from average resonance parameters.UNIVAC1108; FORTRAN IV; EXEC8; GANDY3 requires about 8300 locations for instructions and 22,700 locations for data. Two I/O devices are required for reading and printing and one additional I/O device is necessary if the program is loaded from tape..

22461 (ANL/NESC—342R) **M0648; one-dimensional slab transport with slowing down.** Lois, L. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048342.

Maxima of - 17 energy groups 12 regions 8 Legendre polynomial expansion coefficients 99 equally-spaced mesh-points per region 440 mesh points 10 material compositions No composition can consist of a multiplying medium or of a pure absorber. The boundary conditions can be arbitrary incident on either end or symmetry on one or both ends of the slab.

M0648 solves the one-dimensional slab transport problem with slowing-down for an arbitrary spatial external source and arbitrary scattering.CDC6600; FORTRAN IV; SCOPE 2.0; 154K (octal) memory and 4 tape units for scratch storage.

22462 (ANL/NESC—343R) **M0756;LETO; one-dimensional slab gamma-ray transport.** Lois, L. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048343.

Maxima of - 12 regions 10 materials 13 groups 151 mesh points per region 435 total mesh points 171 total energy mesh points 8 terms in the double range Legendre polynomial expansion of the flux 8 terms in the Legendre polynomial expansion of scattering.

LETO will solve the gamma ray transport and energy deposition problem in one-dimensional laminar slab geometry. The energy group scheme is employed to account for photon energy degradation. An arbitrary external spatial isotropic source may be specified with an arbitrary energy spectrum. The boundary conditions may be (a) free boundaries with arbitrary incident, (b) symmetry on the left arbitrary incident on the right, and (c) symmetry on both ends.CDC6600; FORTRAN IV; SCOPE 2.0; 140K (octal) memory and 3 tape units for scratch storage.

22463 (ANL/NESC—347) CODILLI; least squares analysis of resonance data. Adler, D.B.; Adler, F.T. (Illinois Univ., Urbana (USA). Dept. of Physics). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048347.

The analysis is limited to s-wave neutrons. A maximum of 32 resonance levels can be fitted while a maximum of 20 known resonances can also be introduced. Currently the program allows for 1000 energy points and their corresponding cross section value.

A least-squares analysis of neutron resonance data is performed using the multi-level expansion. The program can handle only one set of cross sections at a time. Options are provided for the analysis of reaction or total cross section data, and for the direct handling of transmission data. By option, one can include the multi-level interference or perform the fit in terms of superimposed symmetric Breit-Wigner lines, while the potential scattering interference is always included in the trial function for the total cross section. Provisions are given for Gaussian and non-Gaussian resolution functions. In the latter case, modification of one subroutine allows for adaptation to any kind of experimental conditions. The relevant convolution integrals involving the trial function are evaluated by Simpson integration with an optional number of integration steps. Besides the resonances to be fitted, the trial function contains an optional number of resonances having known parameters, which may represent resonances external to the region being fitted as well as resonances within the energy interval of interest, thus permitting impurity effects to be described, or, if needed, spin states separated.IBM360; FORTRAN IV; OS/360; IBM360 and auxiliary storage (tape or disk) referred to as logical unit 9 in the program.

22464 (ANL/NESC—352R) RAUMZEIT; one-dimensional time-dependent diffusion calculations. Adams, C.H.; Stacey, W.M. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048352.

Maxima of - 6 energy groups (6 coupled diffusion-type equations) 300 mesh points 40 different material compositions 6 delayed neutron groups.

RAUMZEIT solves systems of one-dimensional, time-dependent, multigroup diffusion-type equations using either of two treatments of the time dependence, finite differencing or the time-integrated approach (see reference 2).CDC6600; FORTRAN IV; SCOPE 2.0 or SCOPE 3.1; 64K memory.

22465 (ANL/NESC—355R) MC-2; fast neutron spectra & multigroup cross section. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy, J.H.; Stenberg, C.G. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048355.

The program uses variable dimensioning throughout so that computer storage requirements depend on a variety of problem parameters. Space requirements range from approximately 400K to 1000K bytes on IBM equipment depending on the complexity of the problem.

MC**2-2 solves the neutron slowing-down equations using basic neutron data derived from ENDF/B data files to determine spectra for use in generating multigroup neutron cross sections. The current edition includes the ability to treat all ENDF/B-V representations, high-order PL scattering representations, a free-format input processor, isotope mixing, delayed neutron processing, and flexibility in output data selection.IBM360,370;CDC7600; FORTRAN IV (99%) and Assembly language (1%) (IBM370), FORTRAN IV (99%) and COMPASS (1%) (CDC7600).; The IBM version of MC**2-2 may be executed under OS or VS operating systems and compiled using the FORTRAN H or program product compilers with the highest level of optimization. The CDC7600 version of MC**2-2 has been implemented on both the Lawrence Berkeley Laboratory and Brookhaven National Laboratory computers with their respective COKE/SCOPE operating systems. The SEGMENTATION LOADER is required and directly addressable LCM is used. The code was compiled using the FORTRAN Extended compiler under OPT=2 optimization; A large amount of fast peripheral storage is required. Storage requirements depend on problem complexity but virtually any reasonable problem may be executed on IBM equipment with 800K bytes or CDC equipment with 50,000 words of SCM and 100,000 words of directly addressable LCM..

22466 (ANL/NESC—358) TWOTRAN2; two-dimensional, multigroup transport in xy, rz, and r theta geometries. Lathrop, K.D.; Brinkley, F.W. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048358.

Variable dimensioning is used so that any combination of problem parameters leading to a container array less than MAXLEN can be accommodated. On IBM machines, TWOTRAN2 will execute in the 4-byte mode so that any combination of problem parameters leading to a container array less than MAXLEN can be accommodated. MAXLEN can be several hundred thousand and most problems can be core-contained. On the CDC machines MAXLEN can be slightly greater than 40,000 words and peripheral storage is used for most group-dependent data.

TWOTRAN2 solves the two-dimensional multigroup transport equation in (x,y), (r,theta), and (r,z) geometries. Both regular and adjoint, inhomogeneous and homogeneous (keff and eigenvalue searches) problems subject to vacuum, reflective, periodic, white or input-specified boundary flux conditions are solved. General anisotropic scattering is allowed and anisotropic inhomogeneous sources are permitted.CDC7600,6600;IBM360/195; FORTRAN IV; Five output units, five interface units (use of interface units is optional) and two system input/output units are required. A large bulk memory is desirable, but it can be replaced by disk, drum or tape storage..

22467 (ANL/NESC—359R) PUN1; unresolved resonance integral cross sections. Steen, N.M. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048359.

No more than 20 spin states per case and 54 energy groups are allowed. An arbitrary energy-weighting spectrum of up to 498 points may be used, but all points must be positive (w(e) greater than 0).

PUN1 evaluates unresolved radiative capture integrals and related multigroup cross sections. The unresolved distributions may have various orbital angular momentum quantum numbers and the effects of Doppler broadening and self-shielding are included.CDC6600; FORTRAN IV; SCOPE 3; 40,000 (octal) locations of central memory storage are required..

22468 (ANL/NESC—361) GLEN; group constant calculations from TOR output data. Clendenin, W.W. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048361.

A maximum of 87 energy points, and 20 groups in the collapsed structure are allowed. Each composition is limited to four heavy, non-moderating isotopes besides the moderator.

The GLEN program interpolates values of a factor proportional to the scattering law from the punched output of the TOR code (NESC Abstract 360). The differential cross section determined from these is integrated over the scattering angle to obtain coefficients of an expansion in Legendre polynomials of this angle for L = 0, 1, 2, 3. Integration over final energies yields values of the total scattering cross section and transport cross section. For each of a series of isotopic compositions (up to 10 compositions) the GLEN code calculates the diffusion length and values of the flux-weighted group average macroscopic scattering, absorption, fission, and transfer cross sections.CDC6600; FORTRAN IV; SCOPE; 64K memory.

22469 (ANL/NESC—368) **FLANGE2/71-1; ENDF/B thermal scattering data.** Honeck, H.C.; Finch, D.R. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048368.

Maximum energy groups = 200. Maximum Legendre order = 5.

FLANGE2 takes cross sections, angular distribution, resonance parameter, and thermal scattering law data from ENDF/B Format II or III data tapes and prepares thermal multigroup cross sections and scattering matrices.IBM360; FORTRAN IV; OS/360; 40K single-precision words of high-speed core plus 3 tape (or disk) units.

22470 (ANL/NESC—370) **GAKIT; one-dimensional, multigroup kinetics with temperature feedback.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Merrill, M.H. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048370.

One-dimensional kinetics calculation - maxima of - 10 prompt neutron energy groups 6 delayed neutron groups 10 homogeneous regions (channels) 100 mesh points Fuel element geometry for heat transfer calculation - In the axial direction the fuel element may consist of a bottom reflector, a core section, and a top reflector. The bottom and top reflectors must have uniform densities and uniform thermal properties, while within the core section of the fuel element up to five radial regions may be used. Maxima of - 15 radial mesh points 20 axial mesh points The fuel elements in all the channels must have the same geometry, the same thermal properties, and the same inlet temperature, but the fuel elements of different channels may have different coolant flow rates and different axial power shapes.

GAKIT solves the multigroup, one-dimensional, time-dependent diffusion theory kinetics equations including delayed neutron effects and temperature feedback based on two-dimensional heat transfer calculations. For the one-dimensional multigroup kinetics equations an arbitrary scattering matrix and arbitrary fission transfer are allowed, and plane, cylindrical, or spherical geometry can be used. A piecewise linear time-dependent inhomogeneous source can be specified. Feedback is available from xenon buildup and temperature dependence of cross sections. The heat transfer calculation is performed for two-dimensional r-z fuel element models assuming predetermined axial power shape functions and time-dependent power amplitudes obtained from the one-dimensional kinetics calculations. For the fuel elements average fuel and moderator temperatures are calculated which determine, based on tables, the temperature-dependent cross sections. Transients may be introduced by step changes of cross sections, by piecewise linear time-dependent cross sections (rod withdrawal accidents), by step changes of the flow rates or by step changes of the coolant inlet temperatures.UNIVAC1108; FORTRAN IV; EXEC2, GAX 23, but any other system with a segmenting facility can be used; 65,536 words of core storage and the facility for segmenting programs.

22471 (ANL/NESC—371R) **NOWIG; one-dimensional, two-group kinetics with temperature feedback.** Yasinsky, J.B. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048371.

NOWIG is used to solve the one-dimensional two-group neutron diffusion and delayed precursor equations using a shape-specified point-kinetics approximation. Feedback due to changes in the fuel metal temperature and coolant density is accounted for by using a model which is identical with that used in the WIGL2 (NESC Abstract 274) program.CDC6600; FORTRAN IV; SCOPE 3.1.

22472 (ANL/NESC—374) **1DX; one-dimensional diffusion fast cross section generation.** Hardie, R.W. (Pacific Northwest Lab., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048374.

1DX is a multipurpose, one-dimensional diffusion code for generating cross sections to be used in fast reactor analyses. The code is designed to - (a) compute and punch resonance shielded cross sections using data in the Russian (see reference 2) format, (b) compute and punch group-collapsed microscopic and/or macroscopic cross sections averaged over the spectrum in any specified zone, and (c) compute keff and perform criticality searches on time absorption, material concentrations, zone dimensions, and buckling using either a flux or an adjoint model.UNIVAC1108;IBM360,370; FORTRAN IV (UNIVAC1108), FORTRAN IV and BAL (IBM360,370); OS/360,370 (IBM360,370); 65K memory and 7 peripheral storage devices (UNIVAC1108), 145K and maximum of 8 storage devices (IBM360,370).

22473 (ANL/NESC—375) **SCORE3; SCISRS ENDF/B graphic cross section evaluation.** Dunford, C.L. (Atomics International Div., Canoga Park, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048375.

SCORE can display up to 500 experimental data points with their associated error bars. Up to 2 smooth curves may be overlayed on a display of experimental data points. Each curve is restricted to 150 points.

SCORE3 is an interactive neutron cross section evaluation system.IBM360; FORTRAN IV and BAL; OS/360, Version 14 or higher; IBM360 Model 50 or higher with 125,000 bytes of fast memory, an IBM2250 graphics console, Models 1, 2, or 3, 2 9-track tape drives, and 1 disk.

22474 (ANL/NESC—376) **AVERAGE; unresolved region average cross section calculations.** Bhat, M.R. (Brookhaven National Lab., Upton, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048376.

AVERAGE calculates average cross sections for up to 100 energy values in the unresolved region. It does not allow for inelastic scattering and calculates only s- and p-wave contributions. Width-fluctuation corrections can vary from 1 to 4.

AVERAGE calculates average scattering, capture, and fission cross sections from s- and p-wave data of the unresolved parameters of File 2 of ENDF/B.CDC6600; FORTRAN IV; SCOPE 2.0; 18K (octal) memory.

22475 (ANL/NESC—377) **SIGPLOT; resolved multilevel Briet-Wigner cross section calculations.** Bhat, M.R.; Cullen, D. (Brookhaven National Lab., Upton, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048377.

SIGPLOT can handle resonance data up to a maximum of 10 different isotopes with a total number of 500 resonances and an L value not exceeding five. It further assumes that the resolved resonance parameters are given for one energy range which is the same for all the isotopes of an element. The mesh points at which the cross sections are calculated can be varied. Since the calculated data are not stored, an increase in the number of mesh points does not conflict with any storage requirements.

SIGPLOT calculates the scattering, capture, fission, and total cross sections from resonance parameters of Version I data from File 2 of ENDF/B. Scattering cross sections may be calculated with or without level-level interference. Provision is also made to numerically Doppler-broaden any of the cross sections.CDC6600; FORTRAN IV; SCOPE 2.0; 37K (octal) memory.

22476 (ANL/NESC—380) **GATT; three-dimensional, few-group diffusion calculations in hexagonal geometries.** Kraetsch, H.; Wagner, M.R. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048380.

GATT allows downscattering from one group into the next and a maxima of - 81 z-planes 104,487 mesh points 4 energy groups 40 macroscopic cross section sets (mixtures) It is assumed that all fission neutrons are born in group 1.

GATT is a three-dimensional few-group neutron diffusion theory program for calculating the detailed spatial flux and power distribution for reactors with hexagonal core configuration. The program uses a uniform triangular mesh in the horizontal mesh planes and assumes a relatively simple region structure in the axial direction. It was designed to represent the special patch-type core structure of the HTGR reactor as closely as possible.UNIVAC1108; FORTRAN IV; EXEC2; 65K memory and 10 files of drum storage with a total of 500,000 words capacity.

22477 (ANL/NESC—384) **CHECKER;CRECT;DAMMET;PLOTFB; SLAVE3 ENDF/B V1 processing codes; CHECKER,CRECT,DAMMET,PLOTFB,... ENDF/B V1 proc.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Ozer, O. (Brookhaven National Lab., Upton, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048384.

In CHECKER correct structure of the data tape is assumed and minor anomalies are noted. Common and major irregularities cause termination of execution accompanied by a core dump. In CRECT correct sequence and material fields of the data tape are assumed. In both CHECKER and CRECT data must be in ENDF/B BCD standard arrangement card image format. In DAMMET a specific reaction cannot be extracted from a tape unless it is within a file or material selected.

This package of five programs is designed for processing ENDF/B (Evaluated Nuclear Data File Version B) Version I tapes. CHECKER checks that the ENDF/B tapes are in proper format and all fields are within specified limits, rather than the physics of the data library. Angular distributions reconstructed from Legendre coefficients are everywhere positive. CRECT, which can process ENDF/B Version III data as well as earlier versions, provides a means of correcting assembled data on a tape by insertion and deletion of data. DAMMET selectively merges data from one or two ENDF/B library tapes onto a final tape. The mode (BCD or binary) and arrangement (standard or alternate) may be changed during this process. PLOTFB processes ENDF/B library tapes which contain data embedded within a necessary library structure in order to produce comprehensive listings and/or plots. The listings and/or plots contain an extensive amount of information related to the data, such as temperature dependence, physical units of the data, interpolation laws for the data, cryptic titles defining the reaction type, etc. SLAVE3 provides modular subroutines which can be assembled to retrieve and process ENDF/B data for a specific problem.CDC6600; FORTRAN IV; SCOPE3 (locally modified); For CHECKER 56,300 octal (approximately 24,000 decimal) words of core storage and one tape (or disk) unit (besides input and output units). For CRECT 13,000 octal words of core storage and two data storage units. For DAMMET 61,000 octal (about 25,000 decimal) words of core storage and a maximum of five tape (or disk) units. For PLOTFB 73,700 octal (about 30,000 decimal) words of core storage and three tape (or disk) units. For SLAVE3 40,000 octal (approximately 18,000 decimal) words of core storage and one or two tape (or disk) units will be required for a typical job..

22478 (ANL/NESC—385) **COHBE;PREP; coherent inelastic scattering law calculations.** Borgonovi, G.M. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048385.

The programs, PREP and COHBE calculate the coherent one-phonon scattering law for polycrystalline beryllium, using an isotropic Debye-Waller factor as an approximation for beryllium. The Debye-Waller factor w is consistent with the definition exp**(-2*w*alpha) in the scattering law.UNIVAC1108; FORTRAN IV; EXEC2; 45K memory and 2 magnetic tapes.

22479 (ANL/NESC—387) **CITATION; one-, two-, and three-dimensional diffusion depletion using multigroup theory.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Cunningham, G.W. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048387.

CITATION has been designed to attack problems which can be run in a reasonable amount of time. Storage of data is allocated dynamically to give the user flexibility in dimensioning. Typically, a finite-difference diffusion problem could have 200 depleting zones, 10,000 nuclide densities, and 30,000 space-energy point flux values.

CITATION is designed to solve problems using the finite-difference representation of neutron diffusion theory, treating up to three space dimensions with arbitrary group-to-group scattering. X-y-z, theta-r-z, hexagonal-z, and triagonal-z geometries may be treated. Depletion problems may be solved and fuel managed for multicycle analysis. Extensive first-order perturbation results may be obtained given microscopic data and nuclide concentrations. Statics problems may be solved and perturbation results obtained with microscopic data.IBM360,303x; FORTRAN IV; OS/360; IBM360/91 or equivalent with at least 128,000 32-bit words of directly-addressable main storage, 7 to 32 I/O devices depending upon the calculation, excluding input and output devices and system requirements..

22480 (ANL/NESC—388) **ETOX3; multigroup constants from ENDF/B for one dimension.** Kidman, R.B. (Hanford Engineering Development Lab., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048388.

ETOX3 (ENDF/B to 1DX) calculates multigroup constants for nuclear reactor calculations using data from the Evaluated Nuclear Data File (ENDF/B) Version II or Version III format. It can also process Version I materials that do not call for partial energy distribution laws 1, 2, 4, 6, or 8 (see END/F, File 5). The code is designed to compute and punch - (a) infinite dilute cross sections, (b) temperature-dependent, self-shielding factors for arbi- trary values of microscopic sigmao (total cross section per atom) in the Russian (Bondarenko) format, and (c) inelastic-scattering probability matrices.UNIVAC1108;IBM360,370; FORTRAN IV; Five tape units or equivalent random-access storage devices are required (3 are scratch units). The UNIVAC1108 version uses 65K words and IBM360,370 300K bytes of main memory..

22481 (ANL/NESC—389R) **STINT3; single-channel space-time synthesis.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy, J.H.; Stacey, W.M. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048389.

Maxima of - 6 equations (groups * modes) 50 axial mesh intervals 6 delayed neutron groups 40 control rod and temperature feedback channels.

STINT3 solves static (eigenvalue) and time-dependent systems of coupled, one-dimensional, diffusion-type equations in slab geometry and is primarily intended for solving single-channel, flux-synthesis equations. The code provides for control rod motion and temperature feedback.CDC6600; FORTRAN IV; SCOPE 3.1; 64K memory.

22482 (ANL/NESC—398R) **BE21; few-group, discrete ordinates for slab geometry.** Schmidt, E. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048398.

The maximum number of ordinates is 60 which may be divided arbitrarily among the groups subject to the restriction that the ordinate schemes be symmetric about, but not include, mu=0 in each group. The corresponding group number limit is 30 with two ordinates per group. Other limitations include - 20 compositions 50 regions 50 source regions.

BE21 solves the few-group discrete ordinates equations in slab geometry. Either homogeneous or inhomogeneous problems can be solved.CDC6600; FORTRAN IV; SCOPE 3.1; 140,000 (octal) locations of fast memory and 2 scratch tapes.

22483 (ANL/NESC—399R) **SUMOR;m0271; s-wave neutron cross section calculation.** Harris, D.R.; Noll, C.B. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048399.

Level-level interference is not permitted in fission channels. SUMOR treats s-wave channels only, and potential cross section is approximated as independent of energy.

SUMOR calculates s-wave neutron cross sections at selected energies. The cross sections are calculated in three approximations to r-matrix theory - the Reich-Moore approximation, the Feshbach, Porter, and Weisskopf approximation, and the sums of single-level formulae approximation. These calculated cross sections or, alternatively, input lists of cross sections, are Doppler-broadened using exact calculation for target nucleii in Maxwellian motion. Calculated cross sections or cross sections divided by neutron energy can be integrated between arbitrary energy limits.CDC6600; FORTRAN IV; SCOPE 3.1; SUMOR requires approximately 135,000 (octal) central memory locations. The number of central memory words could be decreased by decreasing the dimensions of the output cross sections. Also, one input and at least three output devices are required..

22484 (ANL/NESC—401) **GAMTRI; two-dimensional, multigroup, diffusion triangular mesh geometries.** Dorsey, J.P.; Froehlich, R. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048401.

Maxima of - 10 energy groups 20,000 space mesh points 255 different material regions.

The homogeneous two-dimensional multigroup diffusion theory equations with arbitrary group-to-group scattering and arbitrary fission transfer are solved for heterogeneous assemblies in (uniform mesh) triangular geometry. Homogeneous logarithmic boundary conditions are used at the outer surface of non-diffusion regions. The results include the group- and point-dependent neutron fluxes, the power distribution, the neutron multiplication factor, and a detailed neutron balance.UNIVAC1108; FORTRAN IV (90%) and Assembly language (10%); EXEC2, General Atomic Version GAX 23; 65,536 words of core storage, 3 tape units on 1 data channel, 1,572,864 words of drum storage from 1 data channel, and a peripheral printer-punch..

22485 (ANL/NESC—405) **NOAH; one-dimensional, one-group space-time diffusion feedback.** Lellouche, G.S. (Brookhaven National Lab., Upton, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048405.

Maxima of - 6 groups of delayed neutrons 10 regions 500 space points A new region is required when the feedback free value of any of the parameters is changed from the preceding region value.

NOAH solves the one-dimensional, one-group space-time diffusion equation accounting for the effects of fuel, clad, and coolant temperatures (or by changing subroutines fuel, coolant, and solid moderator temperatures) on fission and absorption cross sections, and on the diffusion coefficient and the transverse buckling. It can account for the effects of xenon-iodine feedback. If desired, it will determine long-time xenon-flux behavior assuming the temperatures to be in quasi-static equilibrium. Numerous methods of perturbation are allowed and control of the transient is also provided.CDC6600; FORTRAN IV; SCOPE 2 or 3; 27K memory.

22486 (ANL/NESC—409) **LARCA; flux-weighting of DTF4 cross sections.** Anderson, R.C. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048409.

Maxima of - 25 groups 13 reactions per group 20 zones 36 materials.

Multigroup cross sections are weighted by the flux in the appropriate groups and regions, and cross sections for the assembly are computed and punched in DTF4 format. The program also computes the infinite medium flux, reaction rates, and the infinite multiplication factor and material buckling.CDC6600; FORTRAN IV; SCOPE; 63,000 (octal) storage.

22487 (ANL/NESC—410) **TACASI; analysis of resonance measurements.** Friesenhahn, S. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048410.

As many as 16 observed quantities may be input and as many as 24 subresonances may be included.

TACASI is used to determine the parameters of a single neutron resonance. The code accepts measured values of capture areas, self-indication areas, self-indication ratios and transmission areas and their associated uncertainties in any combination and determines best estimates of the neutron and radiation widths and their standard deviations.UNIVAC1108; FORTRAN IV; EXEC2; 65K memory.

22488 (ANL/NESC—416) **PARTI; optimal group or mesh collapsing.** Harms, A.A. (McMaster Univ., Hamilton, Ontario (Canada). Dept. of Engineering Physics). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048416.

PARTI will optimize the discrete representation of an arbitrary function of one or two independent variables.

PARTI is a group collapsing code which determines the optimum discrete representation of a variable for subsequent repetitive calculations.CDC6500; FORTRAN IV; SCOPE; 32K memory.

22489 (ANL/NESC—426R) **PAX03; harmony-PDQ cross section generation code.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy, J.H.; Kovscek, S.E. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048426.

Maxima of - 30 cells calculated in one problem 30 nuclides represented in the fast energy spectrum 50 nuclides used in other parts of the program 4 fast groups with 1 thermal group or 3 fast groups with 2 overlapping thermal groups 3 perturbed parameters in the temperature feedback calcula- tions unlimited number of depletion times.

PAX03 performs infinite medium, time-dependent calculations of neutron flux spectra in homogeneous, hydrogenous media. A HARMONY file containing few-group microscopic and/or macroscopic cross sections for PDQ7 problems may be generated. The one-dimensional multigroup transport equation may be solved using a P1 to P7 approximation in rectangular, cylindrical, or spherical geometry. Heterogeneous resonance integrals and thermal shielding factors are calculated for either plate or rod geometry. Blackness parameters are calculated and coefficients for temperature feedback calculations are obtained. Few-group constants are available in both the fast and thermal energy ranges.CDC6600; FORTRAN IV and COMPASS; SCOPE 3; System disk, dedicated disk area for Bettis file manager, extended core storage (ECS) for auxiliary storage.

22490 (ANL/NESC—429R) ASPIS; gamma-ray source buildup factor calculations. Lois, L. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048429.

Maxima of - 12 regions 151 spatial mesh points per region 650 total spatial mesh points 10 material compositions 10 MeV maximum energy 251 total energy mesh points 13 energy groups 6 terms in the double range Legendre polynomial expansion of the flux 6 terms in the Legendre polynomial expansion of the scattering kernel.

ASPIS computes the energy, dose and energy deposition buildup factors for monoenergetic gamma rays for a plane isotropic, plane monodirectional, or plane slant source, in an arbitrary laminar array.CDC6600; FORTRAN IV and ASCENT; SCOPE 3.1; 140K (octal) memory and 3 tapes for scratch storage.

22491 (ANL/NESC—430) GAZE2; one-dimensional multigroup diffusion in slab, spherical, and cylindrical geometries. Lenihan, S.R. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048430.

GAZE2 is a one-dimensional, multigroup, neutron diffusion theory program. It includes all four of the standard one-dimensional geometries - slab, sphere, radial cylinder, and axial cylinder, the last of which is identical to slab geometry except when the ZOOM albedo-type transverse boundary condition is used.UNIVAC1108; FORTRAN IV (95%) and Assembly language (5%); EXEC2.

22492 (ANL/NESC—431) SUPERTOG; ENDF/B fine-group constants generation. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Craven, C.W. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048431.

SUPERTOG accepts nuclear data in either a point by point or parametric representation as specified by ENDF/B. This data is averaged over each specified group width. The explicit assumption is made that the flux per unit lethargy is constant or that a suitable weight function will be supplied by the user. When resonance data is available, resolved and unresolved resonance contributions are calculated and used as specified by input options. Fine group constants such as one-dimensional reaction arrays (absorption, fission, etc.), PN elastic scattering matrices, and inelastic and (n,2n) scattering matrices are generated and placed on tapes in formats suitable for use by the GAM1, GAM2, ANISN, or DOT programs.IBM360; FORTRAN IV (ANSI FORTRAN); OS/360; 65K memory, 6 scratch disks, and 1 tape.

22493 (ANL/NESC—436) ETOM1; ENDF/B format to MUFT format cross sections. Dannels, R.A.; Kusner, D.E. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Nuclear Energy Systems Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048436.

ETOM1 processes basic nuclear information given in the ENDF/B format and produces data decks for use in generation of MUFT4 and MUFT5 libraries.CDC6600; FORTRAN IV; SCOPE 3.1; 43,000 (decimal) locations with 2 tapes (scratch tape and library tape).

22494 (ANL/NESC—437) ETOG1; ENDF/B to MUFT, GAM, ANISN corss sections format. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Kellman, S. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Nuclear Energy Systems Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048437.

ETOG1 processes basic nuclear information given in the ENDF/B format and produces data decks for use in generation of MUFT4, MUFT5, GAM1, GAM2, and ANISN libraries.CDC6600; FORTRAN IV; SCOPE 3.1; 55,000 decimal locations and 4 scratch tapes in addition to the library tape and standard input, output, and punch units.

22495 (ANL/NESC—438) BUG2; two-dimensional multigroup diffusion & burnup in xy, rz geometries. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Todt, F. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048438.

Maxima of - 10 groups 20,000 space mesh points 255 regions 300 subregions 40 total nuclides 25 heavy nuclides 25 fission products and other burnable nuclides.

The two-dimensional, multigroup, neutron diffusion equations for x-y or r-z geometry are solved to obtain the multiplication factor and the spatial flux and power distributions. Complete reactor life histories with partial refueling at a number of reload points can be calculated. The depletion scheme of all burnable nuclides is specified by the user at execution time. A regionwide depletion scheme is used. Concentration dependent self-shielding factors may be applied to any nuclide.UNIVAC1108; FORTRAN IV and Assembly language; EXEC2, GAX23; 65,536 words of core storage, 2 million words of drum storage on one data channel, 3 tape units, and a peripheral printer.

22496 (ANL/NESC—439) BUGTRI; two-dimensional multigroup diffusion & burnup in triangular geometries. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Todt, F. (General Atomic Co., San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048439.

Maxima of - 10 groups 20,000 space mesh points 255 regions 300 subregions 40 total nuclides 25 heavy nuclides 25 fission products and other burnable nuclides.

The 2-dimensional multigroup, neutron diffusion theory equations for triangular geometry are solved to obtain the multiplication factor and the spatial flux and power distributions. Complete reactor life histories with partial refueling at a number of reload time-points can be calculated. The depletion scheme of all burnable nuclides is specified by the user at execution time. A regionwise depletion scheme is used. Concentration dependent self-shielding factors may be applied to any nuclide.UNIVAC1108; FORTRAN IV and Assembly language; EXEC2, GAX23; 65,536 words of core storage, 2 million words of drum storage on one data channel, 3 tape units, and a peripheral printer.

22497 (ANL/NESC—453) **RICE; primary recoil atom spectra ENDF/B data.** Jenkins, J.D. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048453.

RICE does not recognize all of the multiplicity of data formats allowed by ENDF/B. It is programmed to accept the most prevalent formats. In addition, the neutron energy distribution is restricted to a 99-group representation and the recoil energies are represented by 200 energy groups.

The program calculates an energy exchange matrix which describes the probability that a neutron with energy E will produce a recoil atom with energy T in a given material. In addition, the program can calculate the primary recoil atom energy spectrum for a given neutron spectrum, the damage cross section for the material, and an optimum lower energy limit for use in comparing the relative damage in different reactor spectra. The program accepts neutron scattering data directly from the ENDF/B library tapes and, in the case of a resonance nuclide, from a tape generated by the program SUPERTOG.IBM360; FORTRAN IV; OS/360; 110,000 words of core storage and five I/O devices other than normal input/output.

22498 (ANL/NESC—459) **DOT2DB; 2-dimensional multigroup diffusion & SN theory.** Protsik, R.; Leff, E.G. (General Electric Co., Sunnyvale, CA (USA). Breeder Reactor Development Operation). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048459.

DOT2DB solves both the multigroup, discrete ordinates transport theory and the multigroup, diffusion theory equations in two dimensions. Anisotropic scattering of any order Legendre expansion is allowed in the transport theory option. Anisotropic scattering in the diffusion theory option is treated with the transport approximation, using the P1 scattering matrix, when provided, to calculate the transport cross section. Options include solutions in (x,y), (r,z), (r,theta), and, in the diffusion theory option, triangular geometries. Both direct and adjoint fluxes may be computed for fixed volume-distributed source, multiplication-constant iteration, time-absorption iteration, concentration search, zone-thickness search, and fixed-boundary source problems. In addition to the fixed-boundary source problem, options include vacuum, reflection, periodic and white boundary conditions. Cross sections may be entered from cards or from tape in the DTF format. Activities for any material in the system may be output by interval (optional) and zone. Other output includes the interval fluxes and sources and a reaction summary table for each zone and for the system.GE635; FORTRAN IV; GECOS-III; 45K memory, 3 to 8 scratch files and a cross-section library file.

22499 (ANL/NESC—462R) **SPAN4; a point-kernel shield evaluation code.** Wallace, O.J. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048462.

SPAN4 calculates the fast neutron dose rate, thermal neutron flux, gamma-ray flux, dose rate, and energy-absorption rate in rectangular, cylindrical, and spherical geometries by integrating appropriate exponential kernels over a source distribution. The shield configuration is flexible--a first-level shield mesh, using any one of the three geometries, is specified. Regions of this same geometry or of other geometries, having their own (finer) meshes, may then be embedded between the first-level mesh lines, defining second-level shield meshes. This process is telescopic--third-level shield meshes may be embedded between second-level meshlines in turn. All meshes may have variable spacing. Sources and detectors may be located arbitrarily with respect to any shield mesh. The source is defined by the function: s=s0+s1(a)*s2(b)*s3(c)+s4(a,b)*s3(c)+s5(a,c)*s2(b)+s6(b,c) *s1(a)+s7(a,b,c) where a, b, and c represent coordinates. If any factor is missing, the corresponding terms are zero. Cross sections, buildup factors, standard compositions, energy structures, dose-conversion factors, infinite line and infinite plane source kernels, and quadratures are contained in a library of approximately 10,000 items.CDC6600; FORTRAN IV and ASCENT; SCOPE 3.1; 64K central memory and one system disk. Microfilm is required if the plot options are to be used.

22500 (ANL/NESC—469) **PMS1; fast neutron polarization experiment.** Morrison, G.W. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048469.

No more than five collisions are allowed and liquid helium must be the polarizer analyzer. The total number of energy points for which phase shifts are given must be less than 100.

PMS1 corrects experimental fast neutron polarization data for finite geometry and multiple scattering effects, when liquid helium is the polarizer analyzer.IBM360; FORTRAN IV(H) and BAL; OS/360; 32K memory.

22501 (ANL/NESC—476) **CAGE;BIRD;SPEC; time-of-flight data analysis.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Young, J.C. (Gulf Radiation Technology, San Diego, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048476.

A maximum of 35 groups for the multigroup calculation for CAGE and BIRD. Deadtime correction routines of SPEC are designed for TMC 201, 211, and 212 1024-channel analyzers and for an on-line CDC1700.

CAGE/BIRD/SPEC is a package of three independent codes designed for the reduction and processing of neutron time-of-flight spectra in pulsed multiplying or non-multiplying assemblies.UNIVAC1108; FORTRAN V; EXEC8; 64K memory and one 100K area of fast drum for CAGE and BIRD. 50K memory, 2 scratch files and, on option, several input/output files for SPEC.

22502 (ANL/NESC—491) **MOD5; stochastic model of neutron slowing-down.** Williamson, T.J. (Naval Postgraduate School, Monterey, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048491.

MOD5 calculates the time- and energy-dependent evolution of the neutron density in homogeneous media following initiation of a) a monoenergetic source distributed over a finite time interval, or b) a source of arbitrary spectrum with a delta-function distribution in time. Effectively the code produces Green's function solutions to the slowing-down equation in discrete numerical form. Leakage is treated in the diffusion approximation. The program a) calculates spectra and energy moments at selected times following the burst of source neutrons, b) evaluates the time-dependent neutron density and slowing-down density at selected energies and computes moments of these densities, c) calculates time-dependent distributions of capture, leakage and first fission, and moments of these distributions, d) calculates steady-state central core neutron flux and leakage flux in detail and in group-averaged form, and e) calculates parameters such as keff.IBM360; FORTRAN IV; IBM360 CP-CMS; 175K bytes memory, normal input, output, program, and punch units, 6 cylinders of IBM2314 or equivalent direct-access storage.

22503 (ANL/NESC—492) RAMP1; Reich-Moore resolved region cross-sections. Bhat, M.R. (Brookhaven National Lab., Upton, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048492.

The program assumes that the resolved resonance parameters are given for a single energy range for all isotopes and can handle resonance data up to a maximum of 10 different isotopes with a total of 500 resonances over all isotope energy ranges and L values and an L value not exceeding 5.

RAMP1 calculates scattering, capture, fission, and total cross sections from Reich-Moore resolved resonance parameters. The resonance parameters are assumed to be in ENDF/B Version II data format. Cross sections may be Doppler-broadened if so desired.CDC6600; FORTRAN IV; SCOPE 3.0; 40K (octal) memory.

22504 (ANL/NESC—506R) JP1XR; coupled-channel scattering cross section calculations. Slavik, C.J. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048506.

Maximum of - 100 angles for which the differential quantities (cross section and polarization) are to be computed.

JP1XR computes scattering cross sections and related quantities for the scattering of nucleons or composite particles from any collective nucleus, even or odd A, vibrational or rotational. The projectile can be charged or uncharged and can have spin 0, 1/2, or 1.CDC6600; FORTRAN IV.

22505 (ANL/NESC—507R) PHASER; phase shift cross section and polarization calculations. Slavik, C.J. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048507.

Maximum of - 15 states to be considered in the Hauser-Feshbach calculation.

PHASER computes the following quantities for the scattering of neutrons from nuclei: total, elastic, and reaction cross sections, differential shape and compound elastic cross sections, differential polarizations, differential and integrated compound level inelastic cross sections, compound and shape elastic Legendre moments in the center-of-mass system.CDC6600; FORTRAN IV; SCOPE.

22506 (ANL/NESC—543) ENDF/B-THERMOS; 30-group ENDF/B scattering kernels. McCrosson, F.J.; Finch, D.R. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048543.

These data are 30-group THERMOS thermal scattering kernels for P0 to P5 Legendre orders for every temperature of every material from s(alpha,beta) data stored in the ENDF/B library. These scattering kernels were generated using the FLANGE2 computer code. To test the kernels, the integral properties of each set of kernels were determined by a precision integration of the diffusion length equation and compared to experimental measurements of these properties. In general, the agreement was very good. Details of the methods used and results obtained are contained in the reference. The scattering kernels are organized into a two volume magnetic tape library from which they may be retrieved easily for use in any 30-group THERMOS library. The contents of the tapes are as follows - VOLUME I Material ZA Temperatures (degrees K) Molecular H2O 100.0 296, 350, 400, 450, 500, 600, 800, 1000 Molecular D2O 101.0 296, 350, 400, 450, 500, 600, 800, 1000 Graphite 6000.0 296, 400, 500, 600, 700, 800, 1000, 1200, 1600, 2000 Polyethylene 205.0 296, 350 Benzene 106.0 296, 350, 400, 450, 500, 600, 800, 1000 VOLUME II Material ZA Temperatures (degrees K) Zr bound in ZrHx 203.0 296, 400, 500, 600, 700, 800, 1000, 1200 H bound in ZrHx 230.0 296, 400, 500, 600, 700, 800, 1000, 1200 Beryllium-9 4009.0 296, 400, 500, 600, 700, 800, 1000, 1200 Beryllium Oxide 200.0 296, 400, 500, 600, 700, 800, 1000, 1200 Uranium Dioxide 207.0 296, 400, 500, 600, 700, 800, 1000, 1200Auxiliary program written in FORTRAN IV; The retrieval program requires 1 tape drive and a small amount of high-speed core.

22507 (ANL/NESC—851) MINX; multigroup crosssections from ENDF/B-IV data. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Kidman, R.B. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048851.

The principal restriction is the computing time available for a given desired accuracy. Because of the need to partition the very large energy versus cross section tabulations in the point-wise library, extensive use is made of the BCD form of the ENDF data. For large problems requiring high accuracy, use of the BCD ENDF format can lead to excessive I/O transfers.

MINX calculates fine-group averaged infinitely-dilute cross sections and self-shielding factors from ENDF/B-IV (reference 2) data. Its primary purpose is to generate a pseudo-composition independent multigroup library for input to the SPHINX (reference 3) space-energy collapse program using CCCC-III (reference 4) standard interfaces. MINX incorporates and improves upon the resonance capabilities of existing codes such as ETOX (reference 5) and ENDRUN (reference 6) and the high-order group-to-group transfer matrices of SUPERTOG (reference 7) and ETOG (reference 8). Fine-group energy boundaries, Legendre expansion order, gross spectral shape component in the Bondarenko (reference 9) flux model, temperatures, and dilutions can all be user-specified.CDC7600;IBM370; FORTRAN IV (H compiler) and BAL (IBM370), FORTRAN IV (RUN or FTN compiler) and COMPASS (CDC7600); OS/370 (IBM370), SCOPE (CDC7600); Storage requirements depend on characteristics of the problem. The 50-group library problem with overlay on the IBM370 requires approximately 330K bytes of memory. NESC tested this problem without overlay using 610K bytes on an IBM370/195. NESC execution of the CDC7600 sample problem required about 127,000 (octal) words of storage.

22508 (ANL/NESC—861) FESH; x-y multi-group neutron transport method. Blomquist, R.N. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048861.

Sources and scattering are assumed to be isotropic; up-scattering is not allowed. Flexible dimensioning permits combinations of problem parameters to occupy an array of 50,000 words. Most group-dependent data is stored in extended core storage (ECS).

FESH solves the spherical harmonics approximation to the second-order multigroup neutron transport equation in two dimensions. A three-dimensional spherical harmonics approximation of user-specified order is applied to the angular variable and two-dimensional spatial finite elements to the spatial variable. Scattering is assumed to be isotropic. Either multiplication eigenvalue problems or subcritical inhomogeneous source problems can be solved with several combinations of vacuum and reflective boundary conditions possible.CDC6600,7600; FORTRAN IV (MNF, University of Minnesota FORTRAN); SCOPE; 200,000 (octal) words of central memory and 142,000 (octal) words of ECS are needed to execute the program. Central memory requirements for single precision arithmetic may be estimated as (45M+10) * (L(L+1)/2)**2 + NSP*((L(L+1)/2)+2) words, where M is the number of material regions, L is the order of the spherical harmonics approximation, and NSP is the number of spatial mesh points.

22509 (ANL/NESC—862) FX2-TH; two-dimensional time-dependent reactor kinetics. Shober, R.A.; Daly, T.A. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048862.

Variable dimensioning is used throughout the program so that computer storage requirements depend on a variety of problem parameters. The amount of memory required can range from 300K bytes for a small problem up to the maximum limit of computer storage for very large problems.

FX2-TH solves the steady-state and time-dependent two-dimensional multigroup neutron diffusion equations with thermal and hydraulic feedback. The following geometry options are available: x, r, x-y, r-z, theta-r, and triangular. FX2-TH contains two basic thermal and hydraulic models: a simple adiabatic fuel temperature calculation and a more detailed model consisting of an explicit representation of fuel pin, gap, clad, and coolant. FX2-TH allows feedback effects from both fuel temperature (Doppler) and coolant temperature (density) changes. The code is designed for nuclear reactor transient analysis.IBM370,303X; FORTRAN IV (99%) and Assembly language (1%); OS/370; FX2-TH will dynamically allocate problem variables either on disk or in computer memory depending on the total amount of computer memory available. For any problem, a certain minimum amount of memory is required; this amount is dependent on the size of the problem. In general, FX2-TH operates more efficiently if sufficient computer memory is available to retain most of the problem variables permanently. The sample problem executed by NESC required 900K bytes of memory.

22510 (ANL/NESC—870R) BNWIGL;UNIWIGL; two-group time-dependent one-dimensional diffusion. Heeb, C.M. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048870.

The total storage set aside for all parameters is 16,000 words for the CDC6600 version and 12,000 for the UNIVAC1108 version. Storage is dynamically allocated permitting the user to establish trade-offs in use of spatial detail, numbers of materials, and delayed neutron groups.

BNWIGL and UNIWIGL solve the one-dimensional, two-energy group, time-dependent diffusion theory equation with thermal feedback. The stand-alone, one-dimensional, steady-state diffusion theory code, HFN, is incorporated to perform critical searches and to determine the initial direct and adjoint fluxes for input to the time-dependent calculation. Problems in slab, cylindrical, and spherical geometries with up to six delayed neutron groups can be solved. Thermal feedback is introduced through the solution of the non-boiling heat transfer equations. Transients can be initiated either from changes in the thermal-hydraulic parameters or by simulated control rod movement in either of the two independent pseudo-rod models. Effects of two and three dimensions can be simulated through the use of interpolation tables for control rod worths and Doppler weighting factors.UNIVAC1108,1100;CDC6600; FORTRAN (99%) and COMPASS (1%) (CDC6600), FORTRAN V (UNIVAC1108); SCOPE 3.4.4 (CDC6600), EXEC8 (UNIVAC1108); If the programs are segmented, 154,000 (octal) words of memory are required for execution of UNIWIGL (CDC6600), and 51,000 words of memory are required for BNWIGL (UNIVAC1108).

22511 (ANL/NESC—878) APARNA2; one-dimensional integral neutron transport in slab geometries. Vaidyanathan, R. (Reactor Research Centre, Kalpakkam (India). Reactor Physics Section). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048878.

The problem size is restricted by memory size. The system is assumed to be non-regenerative. The boundary conditions are arbitrary incoming flux at the left boundary with the right boundary assumed non-reentrant. In addition, extraneous sources can be distributed inside the medium.

APARNA2 solves the one-dimensional integral neutron transport equation with anisotropic scattering in slab geometry.IBM370,303x; FORTRAN IV; OS/370; 400K bytes of memory are required.

22512 (ANL/NESC—880) ACSAP; resonance region cross section analysis. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Young, R.C. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048880.

Maxima of - 250 resonances 100 resonance parameters which can be adjusted simultaneously 25 different isotopes 20 points to be fit in valleys between resonances ACSAP does not adjust the alignment of interfering resonances and the signs of the interference terms. The program returns appreciable errors when used with light nuclides.

ACSAP may be used to compute neutron cross section data from neutron resonance input. Total, fission, capture, or scattering cross section data may be computed. Experimental data may be compared by means of a wide selection of representations. ACSAP can also determine cross section resonance parameters from input experimental data.IBM360,370,303x; FORTRAN IV (92%) and BAL (8%); OS/360,370; 230K bytes of memory are needed for execution of the program; additional memory is required if plotting is desired. Three direct access devices are used to store temporarily calculated theoretical cross sections (logical unit 10), experimental data (unit 11), and difference tables (unit 12).

22513 (ANL/NESC—883) NJOY; neutron & photon crosssections from ENDF/B. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Boicourt, R.M. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048883.

The NJOY nuclear data processing system is a comprehensive set of processing modules for producing pointwise and multigroup cross sections for neutron and photon transport calculations from ENDF/B-IV and -V evaluated nuclear data. Each module performs a well-defined processing task. RECONR reconstructs pointwise (energy-dependent) cross sections from ENDF/B resonance parameters and interpolation schemes. BROADR Doppler-broadens and thins pointwise cross sections. UNRESR computes effective self-shielded pointwise cross sections in the unresolved-resonance region. HEATR generates pointwise heat production cross sections (kerma factors) and radiation-damage-energy production cross sections. THERMR produces incoherent inelastic energy-to-energy matrices for free or bound scatterers, coherent elastic cross sections for hexagonal materials, and incoherent elastic cross sections. GROUPR generates self-shielded multigroup cross sections, group-to-group neutron scattering matrices, and photon production matrices from pointwise input. GAMINR calculates multigroup photon interaction cross sections and kerma factors and group-to-group photon scattering matrices. ERRORR produces multigroup covariance matrices from ENDF/B uncertainties. COVR reads the ERRORR output and performs covariance plotting and output formatting. DTFR formats multigroup data for use in transport codes, such as DTF4 and ANISN. CCCCR formats multigroup data for the CCCC standard interface files ISOTXS, BRKOXS, and DLAYXS. MATXSR formats multigroup data for the cross section interface file MATXS. MODER changes ENDF/B and ENDF-like NJOY interface files from formatted decimal format (BCD or ASCII) into a blocked binary format and back. The ACER module prepares libraries for the Los Alamos continuous-energy Monte Carlo code MCNP, and POWR prepares libraries for the proprietary EPRI-CELL and EPRI-CPM power reactor fuel-cycle codes.

22514 (ANL/NESC—899) ANGCOR; directional correlation coefficients. Ruhter, W.D. (Lawrence Livermore National Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048899.

Input is restricted to no more than ten angles. Correlations are limited to successive gamma-ray cascades.

ANGCOR calculates gamma-gamma directional correlation coefficients and mixing ratios. The program allows the user to compare experimental correlations with theoretical expectations and to simulate data for experimental analysis.CDC6600,7600; FORTRAN IV; SCOPE 3.4 and INTERCOM 4.5 (CDC6600), SCOPE 2.1 (CDC7600); 26,500 (octal) words of memory are required for batch-mode processing, 55,000 (octal) words of memory for interactive operation.

22515 (ANL/NESC—933R) **SCAP; point kernel single or albedo scatter.** Disney, R.K.; Bevan, S.E. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048933.

The geometric zone description is restricted to zones defined by boundary surfaces defined by the general quadratic equation or one of its degenerate forms. Due to flexible dimensioning in SCAP, there are no restrictions on the number of energy groups or geometric zones.

SCAP solves for radiation transport in complex geometries using the single- or albedo-scatter point kernel method. The program is designed to calculate the neutron or gamma-ray radiation level at detector points located within or outside a complex radiation scatter source geometry or a user-specified discrete scattering volume. The geometry is described by zones bounded by intersecting quadratic surfaces with an arbitrary maximum number of boundary surfaces per zone. The anisotropic point sources are described as point-wise energy dependent distributions of polar angles on a meridian; isotropic point sources may be specified also. The attenuation function for gamma rays is an exponential function on the primary source leg and the scatter leg with a buildup factor approximation to account for multiple scatter on the scatter leg. The neutron attenuation function is an exponential function using neutron removal cross sections on the primary source leg and scatter leg. Line or volumetric sources can be represented as distributions of isotropic point sources, with uncollided line-of-sight attenuation and buildup calculated between each source point and the detector point.CDC7600,CYBER175; FORTRAN (99%) and COMPASS (1%); SCOPE 2.1 (CDC7600), NOS 1.3 (CDC CYBER175); 55,000 (octal) words of memory are needed to execute the SCAP program on the CDC CYBER175.

22516 **(CONF-811145—16) Neutron-source characterization and radiation-damage calculations for material studies.** Greenwood, L.R. (Argonne National Lab., IL (USA)). 9 Nov 1981. Contract W-31-109-ENG-38. 15p. NTIS, PC A02/MF A01. Order Number DE83007857.

From International conference on neutron irradiation effects; Argonne, IL, USA (9 Nov 1981).

In our quest to understand radiation damage in materials, it is vital that we characterize radiation sources in terms of neutron flux and spectra as well as the more-fundamental displacement damage, gas production, and transmutation rates. Such data are crucial to correlations of materials-property changes in different environments and to predictions of materials performance in inaccessible environments, such as fusion reactors. Dosimetry techniques have been developed to measure the neutron flux and spectra in diverse facilities including thermal, fast, and mixed reactors, T (d,n) and Be (d,n) accelerator sources, and high-energy spallation sources. Displacement-damage cross sections have been calculated for 36 elements spanning the periodic table. All of these exposure parameters can now be routinely measured with 10 to 15% relative accuracy at all existing radiation-effect facilities. 4 tables.

22521 **(PB—82-236860) White source use in a neutron standards laboratory. Final report.** Bowman, C.D.; Carlson, A.D.; Wasson, O.A.; Schrack, R.A.; Behrens, J.W. (National Bureau of Standards, Washington, DC (USA)). Jun 1980. 16p. Pub. in Proceedings of IAEA Consultants' Meeting on Neutron Source Properties, Kossuth Lajon University, Debrecen, Hungary, March 17-21, 1980, p119-134 1980.

Methods are described for accurately characterizing the neutron beam from a white source in spectral shape, absolute intensity, and source brightness distribution. Measurements can be made over more than nine decades of energy from .01 to 2 x 10 to the 7th power eV from a single source. Beams with easily modified spectrum and with total intensity (integrated over energy) of 1,000,000 n/sq cm-sec can be obtained. Over most of the energy range these methods can be implemented with a modest electron linac facility operating in the 10 - 12 MeV range. Such a versatile facility is perhaps within the budgetary range of even a modest laboratory.

22522 **Electron thermalization in gases. V. Diatomic molecules H_2, N_2, and CO.** Tembe, B.L.; Mozumder, A. (Radiation Laboratory and the Department of Chemistry, University of Notre Dame, Notre Dame, Indiana 46556). *Journal of Chemical Physics;* **78**: No. 4, 2030-2038(15 Feb 1983).

The method introduced by one of us (AM) for calculating the thermalization times, evolution of the effective electron temperature, and other quantities of interest in electron thermalization, is extended to the diatomic molecules H_2, N_2, and CO. Starting with a displaced pseudo-Maxwellian distribution function for energetic electrons, the evolution of the thermalization process is studied using available cross section data for elastic and inelastic processes. Careful attention has been paid to microscopic reversibility and detailed balancing. We find that, while the major contributions to thermalization are due to rotational and vibrational excitations of the gas molecules, the contribution due to elastic collisions is not negligible. We also find that the relaxation time (obtained from the relaxation time due to inelastic and elastic processes) is a significant part of the thermalization time. The relative contributions of elastic and inelastic processes are evaluated as a function of time as well as gas temperature. Calculated results are in reasonable agreement with experimental data.

22523 **Density effect for the ionization loss of charged particles in various substances.** Sternheimer, R.M.; Seltzer, S.M.; Berger, M.J. (Department of Physics, Brookhaven National Laboratory, Upton, New York 11973). *Physical Review [Section] B: Condensed Matter;* **26**: No. 11, 6067-6076(1 Dec 1982).

The density-effect correction $\delta(\beta)$ for the ionization energy loss of charged particles has been evaluated for 72 substances (34 metallic elements, 26 compounds, 11 gases, and liquid hydrogen), using up-to-date values of the mean excitation potential I and of the atomic absorption edges hν/sub i/, which were employed as input data for the general equations for $\delta(\beta)$ previously derived by Sternheimer.

22524 **Calorimetric measurement of electron stopping power of aluminum and copper between 11 and 127 keV.** Hubbell, H.H. Jr.; Birkhoff, R.D. (Health and Safety Research Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37830). *Physical Review [Section] A: General Physics;* **26**: No. 5, 2460-2467(Nov 1982).

The stopping powers of aluminum and copper have been measured for electrons between 11 and 127 keV. Evaporated foils of about 200-nm thickness were stretched across rings and inserted into a short cylinder which was supported by thermocouple wires. Peltier heating and cooling by one thermopile were used to control foil temperature, while another thermopile measured its temperature. Calibration was accomplished by reducing beam energy until complete absorption was obtained. Delta rays produced in the foil were returned to it by repelling electrodes. Corrections were made for increased path length in the foil due to multiple elastic small-angle scattering and for spurious heating by scattered electrons striking the ring holding the foil. After correction for these effects, good agreement with the Bethe-Bloch formula was found.

22525 **Physical measurements with high-energy radioactive beams.** Chatterjee, A.; Saunders, W.; Alpen, E.L.; Alonso, J.; Scherer, J.; Llacer, J. (Lawrence Berkeley Lab., CA). *Radiation Research;* **92**: No. 2, 230-244(Nov 1982). Contract W-7405-ENG-48.

Physical measurements were made with high-energy radioactive beams (positron emitters) produced as secondary particles from a heavy-particle accelerator. Data are presented for water-equivalent thickness of a silicon diode, a comparison of Bragg peak ionization depth vs stopping depth, and differential stopping depths when a beam is intercepted by heterogeneous materials in the orthogonal direction. A special positron-emitting beam analyzing (PEBA) system was used in form images of the stopped radioactive beam. These measurements will have direct impact on charged-particle radiotherapy, since the precise range of beams of charged particles to targets within patients can be measured and used for treatment planning. Also, during the treatments the stopping point of the beam can be monitored to verify that the treatment is being delivered as planned.

22526 **Subshell stopping power of the elements for protons in the Born approximation.** McGuire, E.J. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Physical Review [Section] A: General Physics;* **26**: No. 4, 1858-1870(Oct 1982).

The generalized oscillator-strength formulation of the Born approximation was used to generate a large sample of subshell excitation and ionization generalized oscillator strengths across the periodic table. These were used to calculate the excitation and ionization contributions to the proton stopping power by individual subshells. The subshell ionization stopping powers are expressed in scaled form, depending on the subshell ionization energy. Detailed comparison of the calculated total proton stopping power is in good agreement with experiment across the periodic table. Detailed calculations show the importance of outer-shell ionization and excitation to the total stopping power for protons with energy less than 10 MeV.

22527 **Stopping power of some lightly ionized gold ions for protons.** McGuire, E.J. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Physical Review [Section] A: General Physics;* **26**: No. 4, 1871-1882(Oct 1982).

Calculations are presented for the stopping power of Au/sup n/+ (0< or =n< or =11) for protons with energy between 0.1 and 10 MeV. Over this range the proton stopping power changes by at least a factor of 2 between neutral and 11 times ionized gold. Explicit Born-approximation calculations are done for both excitation (for all ions considered) and ionization (for selected ions). For inner shells (nl< or =4d) the explicit calculations are in excellent agreement with results obtained from scaling laws. For outer shells (nl> or =4f) there are differences of as much as a factor of 2 between the explicit calculations and the scaling laws for some subshells of some ions. A correction to the scaling laws using an integral over optical oscillator strength is developed which removes some of the disagreement between the explicit calculations and scaled values. The residual difference between the explicit calculations and the scaled values appears to arise from the spatial expansion of an ion subshell orbital compared to an atom subshell orbital even when the subshells have the same ionization energy.

22528 **Gamma-ray dose at shield-tissue interfaces and buildup factor implications.** Trubey, D.K.; Gopinath, D.V.; Subbaiah, K.V. (Oak Ridge National Laboratory, Oak Ridge, TN 37830). *Transactions of the American Nuclear Society;* **41**: 494-495(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

22529 **Sensitivity study of neutron transport through standard and rebar concrete.** Bhuiyan, S.I.; Lucius, J.L.; Roussin, R.W. (Oak Ridge National Laboratory, Oak Ridge, TN 37830). *Transactions of the American Nuclear Society;* **41**: 493(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

22530 **Monte Carlo particle transport to GeV energies.** Prael, R.E. (Los Alamos National Laboratory, P.O. Box 1663, Los Alamos, NM 87545). *Transactions of the American Nuclear Society;* **41**: 480-481(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

22531 **Finite-difference approximations and superconvergence for the discrete-ordinate equations in slab geometry.** Larsen, E.W. (Los Alamos Scientific Lab., NM); Nelson, P. *SIAM (Society for Industrial and Applied Mathematics) Journal on Numerical Analysis;* **19**: No. 2, 334-348(Apr 1982).

A unified framework is developed for calculating the order of the error for a class of finite-difference approximations to the monoenergetic linear transport equation in slab geometry. In particular, the global discretization errors for the step characteristic, diamond, and linear discontinuous methods are shown to be of order two, while those for the linear moments and linear characteristic methods are of order three, and that for the quadratic method is of order four. A superconvergence result is obtained for the three linear methods, in the sense that the cell-averaged flux approximations are shown to converge at one order higher than the global errors.

22532 **Flux limiters and Eddington factors.** Pomraning, G.C. (Lawrence Livermore National Lab., CA). *Journal of Quantitative Spectroscopy and Radiative Transfer;* **27**: No. 5, 517-530(1982). Contract W-7405-ENG-48.

In this paper a closure scheme for the first two angular moments of the time-dependent equation of transfer is presented, either via an Eddington factor which leads to a telegrapher's description, or via a Fick's law which leads to a diffusion description. Points discussed include boundary conditions (both an extension of the classic Marshak-Milne condition and those arising from a boundary layer analysis), the flux limiting feature of the diffusion approximation, and the reduction of the theory to asymptotic diffusion theory in the steady state limit.

22533 **Directions in the theory of resonance-radiation pressure.** Cook, R.J. (California Univ., Livermore (USA). Lawrence Livermore Lab.). *Comments on Atomic and Molecular Physics;* **10**: No. 6, 267-277(May 1981).

A number of recent developments in the theory of atomic motion in resonant radiation are explained and discussed. Specific topics covered include: (i) the spontaneous radiation force; (ii) the anomalous radiation force on an inverted atomic transition; (iii) trapping of atoms by the dipole force; (iv) cooling by the dissipative force in a below-resonance standing wave; and (v) the optical Stern-Gerlach effect. In addition, it is shown how quantum fluctuations of the resonance-radiation force limit the temperature achievable by radiation cooling and limit the confinement time for an atom in a radiation trap.

22534 Low-temperature measurements of the fraction of re-emitted positronium from a Cu(111)+S surface. Lynn, K.G.; Schultz, P.J.; MacKenzie, I.K. (Brookhaven National Lab., Upton, NY). *Solid State Communications;* **38**: No. 6, 473-476(1981).

A positron beam has been utilized to measure the positronium (Ps) fraction re-emitted from a Cu(111)+S sample from 40°K to 350°K for incident energies ranging from 0.5 to 5 keV. The results at 525 eV incident energy are compared with two recent theories from 40°K to 850°K. The Ps fraction shows only a slight positive temperature dependence below room temperature and it is concluded that the positron trapping rate and probability of Ps formation at the surface are largely independent of sample temperature for Cu(III)+S. In addition evidence is presented that positrons in the bulk material are not localized in shallow traps at low temperatures for well-annealed high-purity single crystals of Cu and Al.

22535 Use of mean absorption coefficients in the presence of strong temperature gradients. Pomraning, G.C. (Lawrence Livermore National Lab., CA); Prinja, A.K.; Shokair, I.R. *Journal of Quantitative Spectroscopy and Radiative Transfer;* **26**: No. 3, 199-213(1981).

Results obtained by using the Planck and Rosseland mean absorption coefficients are compared with exact multifrequency transport results in a purely absorbing halfspace problem in the presence of strong temperature gradients. Numerical results are given for both a prescribed temperature distribution in the presence of an Elsasser band absorption coefficient and a self-consistent radiative equilibrium distribution corresponding to a source deep within the halfspace transporting through a picket fence absorption coefficient. This latter problem (the Milne problem) is analyzed using the Wiener-Hopf factorization technique, and an explicit expression is given for the characteristic H-function. It is concluded that the use of the Rosseland mean in generally more accurate than the use of the Planck mean, but that the Rosseland mean results can nevertheless be significantly in error.

22536 Lorentz gas. Alder, B.J.; Alley, W.E. (Lawrence Livermore Lab., CA). pp 5-21 of Perspectives in statistical physics. Raveche, H.J. (ed.). Amsterdam, Netherlands; North-Holland Publishing Company (1981).

The Lorentz gas is discussed for two reasons. First, it is believed that unless the behavior of the Lorentz gas is understood in detail, the theory of transport properties is in bad shape. This is because the Lorentz gas is the simplest conceivable model of transport, yet it appears to obey not even in the low density limit, molecular chaos approximation, thought so generally applicable. The second reason is because of the contribution to the theory of transport properties by Mel Green, namely the fluctuation-dissipation approach. That approach gives general expressions for transport coefficients valid at all times and densities in terms of correlation or autocorrelation functions calculated from a system at equilibrium. It is the combination of computer simulation and the autocorrelation formulation that has proven so fruitful in advancing understanding of transport theory. A discussion is given of the autocorrelation function calculated by computer for the Lorentz gas at low density and intermediate densities. A discussion of the theory is also presented. (SC)

22537 Report on the seventh international conference on transport theory. Greenberg, W.; Williams, M.; Zweifel, P.F. (Virginia Polytechnic Inst. and State Univ., Blacksburg). *Transport Theory and Statistical Physics;* **10**: No. 3, 115-130(1981).

A brief summary is given of each of the 29 papers given at the 7th international conference on transport theory. (SC)

22538 (ANL/NESC—413) ALPHA-M; resolution of gamma-ray spectra. Schonfeld, E. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048413.

ALPHA-M is used for determining radioisotopes by least-squares resolution of the gamma ray spectra. It can handle a very large library of gamma ray spectra and takes into account corrections such as background subtraction, counting time, decay time, dead time, automatic compensation for gain and threshold shifts, size of the aliquot, volume reduction prior to counting, and so on.IBM360; FORTRAN IV.

22539 (ANL/NESC—418) CHAINS; analysis of radioactive decay chains. Henderson, W.B. (Westinghouse Electric Corp., Pittsburgh, PA (USA). PWR Systems Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048418.

Maxima of - 50 members in a chain 100 energy groups 100 time values.

CHAINS computes the atom density of members of a single radioactive decay chain. The linearity of the Bateman equations allows tracing of interconnecting chains by manually accumulating results from separate calculations of single chains. Re-entrant loops can be treated as extensions of a single chain. Losses from the chain are also tallied.GE625,635; FORTRAN IV; GECOS; 16K memory.

22540 (NUREG/CR—2891) Performance testing of personnel-dosimetry services. Final report of test No. 3. Plato, P.; Miklos, J. (Michigan Univ., Ann Arbor (USA). School of Public Health). Feb 1983. 174p. NTIS, PC A08/MF A01 - GPO $6.50. Order Number DE83901542.

In September, 1977, the University of Michigan began a pilot study of the Health Physics Society Standards Committee (HPSSC) Standard titled, Criteria for Testing Personnel Dosimetry Performance. Approximately 70 dosimetry processors volunteered to participate in one or more of three tests of the HPSSC Standard. The results from Tests No. 1 and No. 2 were used to evaluate and revise the Standard which was then adopted by the HPSSC in June, 1981. The Standard was also adopted by the American National Standards Institute as ANSI N13.11-1982 in June, 1982. Test No. 3 of the revised HPSSC Standard was conducted from November, 1981 to April, 1982. The objectives of Test No. 3 were to determine if the Standard is acceptable for future testing programs, and to provide experience with the final version of the Standard. The passing rate among all the processors for Test No. 3 was 75% compared to passing rates of 48% and 62% for Tests No. 1 and No. 2, respectively, with adjustments made for changes in the Standard following Test o. 2. Among all the individual dosimeters irradiated during Test No. 3, 89% had a reported dose within +-50% of the delivered dose compared to 79% and 86% of the dosimeters irradiated for Test No. 1 and No. 2. The HPSSC Standard was found to be an acceptable measure of minimum performance and an appropriate basis for a regulatory program to accredit dosimetry processors.

22541 (NUREG/CR—2892) Performance testing of personnel dosimetry services. A revised procedures manual. Miklos, J.; Plato, P. (Michigan Univ., Ann Arbor (USA). School of Public Health). Feb 1983. 217p. NTIS, PC A10/MF A01 - GPO $7.50. Order Number DE83901539.

The US Nuclear Regulatory Commission's pilot study of the Health Physics Society Standards Committee Standard, Criteria for Testing Personnel Dosimetry Performance, was begun in 1977. A third test of this Standard was conducted from November, 1981 through April, 1982. The objective of this Procedures Manual is to describe the procedures used for Test No. 3 which reflect the changes in the Standard from Tests No. 1 and No. 2. This Manual describes each of the radiation sources used for Test No. 3, as well as the administrative procedures used during the test program. Methods of irradiation, quality control, data analysis, record keeping, and handling large numbers of dosimeters are presented. This Manual discusses the role of the National Bureau of Standards in verifying the validity of the calibration of each radiation source. Suggestions for improving irradiation procedures are included as well as recommendations that will facilitate the operation of the permanent testing facility.

22542 **(PB—83-139246) Report on standardization of radiation dosimetry.** Mann, W.B. (National Bureau of Standards, Washington, DC (USA)). 1978. 8p. Pub. in Proceedings of IAEA Symposium, National and International Standardization of Radiation Dosimetry, Atlanta, GA., Dec 77, II, p147-154 1978.

From nuclear data tables, such as those compiled by the Oak Ridge Nuclear Data Project, the absorbed dose to a homogenous medium can be calculated from given values of the mean energy per radiation, expressed in gram rad per microcurie hour. To make any of these calculations the activities of the various components of radioactive effluents or of the administered radiopharmaceuticals must be known. For more than ten years the Radioactivity Section of the National Bureau of Standards has been devoting a very considerable part of its effort to the production of radioactivity standards that are needed in environmental and nuclear-medicine measurements. Such standards are also being produced in appropriate environmental matrices and the latest available nuclear-decay data, often produced in the Radioactivity Section, is also supplied. Traceability to the International and National Radioactivity Measurements Systems is discussed.

22543 **(PNL-SA—10714) Ninth DOE workshop on personnel neutron dosimetry.** (Pacific Northwest Lab., Richland, WA (USA)). Dec 1982. Contract AC06-76RL01830. 231p. (CONF-820668—). NTIS, PC A11/MF A01. Order Number DE83006605.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

Separate abstracts wre prepared for 18 of the 19 papers presented at a workshop on personnel neutron dosimetry. The other paper is a duplicate of a paper already in the data base. (KRM)

22544 (PNL-SA—10714, pp 120-137) **Neutron and gamma radiation transport problems solved using TARNP and MORSE codes.** Prevo, C. (Lawrence Livermore National Lab., CA). Dec 1982. NTIS, PC A11/MF A01.

From 9. DOE workshop on personnel neutron dosimetry; Las Vegas, NV, USA (24 Jun 1982).

It is important for any research and development program that calculational tools be available to complement experimental efforts. In neutron dosimetry, calculations enable one to predict the response of a proposed dosimeter before effort is expended to design and fabricate the neutron intrument or dosimeter. Also, since the neutron spectrum is so important in determining how a particular dosimeter will response, having the ability to calculate the neutron spectrum for a wide variety of source, moderator, and shield configurations is extremely valuable. The nature of these calculations requires the use of computer programs that implement mathematical models representing the transport of radiation through attenuating media. Numerical and in some cases analytical, solutions of these models can be obtained by one of several calculational techniques. Calculational methods include spherical harmonics, discrete ordinates, moments, Monte Carlo, diffusion theory, invariant imbedding, and kernels, plus invariant bedding method, all of these techniques are either approximate solutions to the well-known Boltzmann equation or are based on kernels obtained from solutions to the equation. This paper focuses on the Monte Carlo technique.

22545 **Investigation of buildup dose from electron contamination of clinical photon beams.** Petti, P.L.; Goodman, M.S.; Gabriel, T.A.; Mohan, R. (Department of Physics and Cyclotron Laboratory, Harvard University, Cambridge, Massachusetts 02138). *Medical Physics;* **10**: No. 1, 18-24(Jan 1983).

The contribution made by contaminating electrons present in a clinical photon beam to the buildup dose in a polystyrene phantom has been calculated and compared to measurements. A Monte Carlo technique was employed. The calculation was divided into two parts. First, the accelerator treatment head was simulated in detail using the EGS—PEGS electromagnetic shower code. Then, information obtained from these calculations was used to compute dose curves in a polystyrene phantom. Two cases were considered, one in which both electrons and photons were incident upon the phantom, and another in which electrons were eliminated from the incident beam. Results of these calculations agree with recent experimental findings. A decrease in buildup dose as well as a shift in d/sub max/ was observed when electrons were eliminated from the beam.

22546 **(ANL/NESC—360) TOR; thermal scattering for crystalline materials.** Clendenin, W.W. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048360.

The phonon frequency distribution is specified by 4 to 201 points.

The TOR program calculates the scattering law for a crystalline material in the incoherent approximation, from the phonon frequency distribution and a specified temperature. A proportional quantity is punched in the form of a table for interpolation of the double differential cross section. As an alternative, the program obtains the analogous quantities for a monatomic gas.CDC6600; FORTRAN IV; SCOPE; 32K memory.

22547 **(ANL/NESC—938) ORTEP2; crystal structure illustration plots.** Johnson, C.K. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048938.

Maxima of - 599 stored bonds 166 atoms in the input list.

ORTEP2 draws crystal structure illustrations using a CalComp plotter. Ball-and-stick type illustrations of publication quality are produced with either spheres or thermal-motion probability ellipsoids on the atomic sites. The program can produce stereoscopic pairs of illustrations which aid in the visualization of complex packing arrangements of atoms and thermal motion patterns. Interatomic distances, bond angles, and principal axes of thermal motion are calculated also as part of the structural study. ORTEP2 includes a hidden-line algorithm to eliminate those portions of atoms or bonds behind other atoms or bonds.IBM360,370,303x; FORTRAN IV (90%) and Assembly language (10%); OS/360; 284K bytes of memory and plotting devices.

22548 **(CONF-811150—11) Theory of Moessbauer line broadening due to diffusion.** Schroeder, K.; Wolf, D.; Dederichs, P.H. (Argonne National Lab., IL (USA)). Dec 1981. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01. Order Number DE83007759.

From Yamada conference on point defects and defect interactions in metals; Kyoto, Japan (16 Nov 1981).

We have calculated the line broadening of the Moessbauer line due to diffusion of Moessbauer atoms via single vacanices. We take into account the perturbation of vacancy jumps in the neighbourhood of an impurity Moessbauer atom (e.g. Fe in Al) using the 5-frequency model. The anisotropy of the line width is given by the Fourier transform of the final distribution of a Moessbauer atom after an encounter with a vacancy. This distribution is calculated by Monte Carlo computer simulation. 3 figures, 1 tables.

22549 **Rietveld refinement with spallation neutron powder diffraction data.** von Dreele, R.B. (Arizona State Univ., Tempe (USA). Dept. of Chemistry); Jorgensen, J.D. (Argonne National Lab., IL (USA)); Windsor, C.G. (UKAEA Atomic Energy Research Establishment, Harwell). *Journal of Applied Crystallography;* **15**: No. 6, 581-589(1 Dec 1982).

The mathematical functions necessary for Rietveld refinement of time-of-flight neutron powder diffraction patterns from spallation sources are developed and a computer program for least-squares analysis is described. The results of Rietveld refinements of nickel and a low-carbon steel are described and discussed. The method fully exploits the high resolution (Δd/d approximately 0.3 approximately 0.5%) available with powder diffractometers currently in operation on these sources and examples are given of precise determination of atom coordinates, thermal parameters, lattice parameters and the detection of small strains.

22550 **Energy and entropy of interacting dislocations.** Ladd, A.J.C.; Hoover, W.G. (Department of Applied Science, University of California at Davis, Davis, California 95616). *Physical Review* [*Section*] *B: Condensed Matter;* **26**: No. 10, 5469-5479(15 Nov 1982). Contract W-7405-ENG-48.

The energy and entropy of interacting edge dislocations have been calculated by atomistic simulations, with the use of piecewise-linear forces in a two-dimensional triangular lattice. We conclude that the interaction energy between small groups of dislocations is well described by continuum mechanics for separations greater than a few lattice spacings. Our calculations enable us to make a precise determination of the core energy, which is an essential parameter in determining dislocation multiplication rates. We find also that continuum mechanics gives an accurate representation of the interaction of a dislocation pair with a homogeneous elastic stress field. The vibrational contribution to the entropy of such a pair is small, about 0.3k.

22551 **Small and large wave vector behavior for the structure factor of an interacting nonuniform electron gas.** Geldart, D.J.W. (Universite de Paris Sud, Orsay, France); Rasolt, M. *Physics Letters* [*Section*] *A;* **88**: No. 3, 121-124(1 Mar 1982). Contract W-7405-ENG-26.

It is shown that the structure factor of an interacting nonuniform electron gas does not go to zero at small q, as one might conclude from the conservation of particles sum rule, and is not giving rigorously in the local density approximation at large q.

22552 **Finite element part of the Lamcal program.** Lamain, L.G.; Blanckenburg, J.F.G. Luxembourg; Commission of the European Communities (1982). 58p. (EUR—7999-EN). Commission of the European Communities, Luxembourg.

The code is based on the displacement method using the small strain incremental plasticity theory. The non-linear basic equations are expressed in the tangent modulus formulation and solved by an iterative procedure. Iterations are applied until a specified tolerance on the equilibrium is reached. To avoid that a stress state moves outside the yield surface, a substepping in the stresses is performed every iteration. To judge the solution process, the change in stress-state of an integration point is given every iteration (from the elastic to plastic or from plastic to elastic state). Also the norm of the residual stresses is given every iteration to be able to check the convergence rate.

22553 **Self-consistent approximations beyond the CPA. Part II.** Kaplan, T. (Oak Ridge National Lab., TN); Gray, L.J. pp 129-143 of Excitations in disordered systems. Thorpe, M.F. (ed.). New York, NY; Plenum Publishing Corp. (1982). Contract W-7405-ENG-26.

A short description of the Augmented Space Formalism is given. Next, the self-consistent approximation is developed and several model calculations are provided. Then the extension of the self-consistent approximation to alloys with short-range order is examined. (SC)

22554 **The metallization of some simple systems.** Ross, M.; McMahan, A.K. (Lawrence Livermore National Lab., CA). pp 161-168 of Physics of solids under high pressure. Schilling, J.S.; Shelton, R.N. (eds.). Amsterdam, Netherlands; North-Holland Publishing Company (1981). Contract W-7405-ENG-48.

This paper discusses the metallization of Xe, Ar, He, I_2, H_2, and N_2 in terms of some recent theoretical work and shock-wave experiments. New shock-wave data on liquid hydrogen and deuterium leads to a predicted pressure above 3 Mbar for the appearance of a monatomic metal phase. CsI is expected to become metallic near 0.8 Mbar.

22555 **Validity of the Onsager reciprocal relations.** Mullins, W.W.; Sekerka, R.F. (Carnegie-Mellon Univ., Pittsburgh, PA). *Scripta Metallurgica;* **15**: No. 1, 29-33(1981). Contract AC02-76ER02407.

This article examines the conditions under which the Onsager reciprocal relations hold for the matrix of transport coefficients in the constitutive laws for heat and mass transport in continuous systems. For a K component system and a suitable choice of reference frame, those laws may be expressed in the form vector J/sub i/ = summation from j = 0 to K [H/sub ij/vector F/sub j/] summation from j = 0 to K [H/sub ij/grad h/sub i/ where vector J_0 is the energy flux, vector J/sub i/ for i = 1,. . .,K is the mass flux of the i/sup th/ species, and the vector F/sub j/ = grad h/sub j/ are thermodynamic driving forces in which the h/sub j/ are potentials that are functions of the local thermodynamic state; and H/sub ij/, also functions of the local state, are the transport coefficients whose symmetry is under consideration. All terms in Equation 1 will depend in general on position.

22556 **Coherent medium approach to hopping conduction.** Lax, M.; Odagaki, T. (City Coll., New York). *Lecture Notes in Physics;* No. 154, 148-176(1981).

The coherent medium approach to hopping conduction problems where the motion of carriers obey the usual random walk equation is presented. The coherent medium approximation (CMA) is introduced to obtain an approximate but easily tractable coherent medium. The CMA is applied to various cases of hopping conduction in one- and three-dimensions and the results are compared with experiment. A simple comparison of CMA with other methods is also given. (SC)

22557 **(N—8229374) Critical fields of liquid superconducting metallic hydrogen.** Jaffe, J.; Ashcroft, N.W. (Cornell Univ., Ithaca, NY (USA)). Jul 1982. 14p. (NASA-CR—169160; MSC—4775). NTIS, PC A02/MF A01.

Liquid metallic hydrogen, in a fully dissociated state, is predicted at certain densities to pass from dirty to clean and from type II to type I superconducting behavior as temperature is lowered.

22558 **(SAND—82-1907C) Bechgaard salts: magnetotransport, dimensionality, spin-density waves, and the threshold field.** Kwak, J.F. (Sandia National Labs., Albuquerque, NM (USA)). 1982. Contract AC04-76DP00789. 9p. (CONF-821226—1). NTIS, PC A02/MF A01. Order Number DE83006398.

From Low dimensional contractors conference; St. Maurice, France (10 Dec 1982).

A review of the metallic-state magnetotransport properties of the superconducting Bechgaard compounds (organic compounds based on 2:1 salts of tetramethyltetraselenafulvalenium) is presented, with emphasis on the unique threshold field associated with the Shubnikov-de Haas effect. Orbit area calculations based on the currently accepted band anisotropy imply nesting of the Fermi surface by an instability at a commensurate wavevector other than the optimal value (2k/sub F/, π/b), leading to a model of wavevector commensuration shift at the threshold. The evidence for spin-Peierls ordering as the relevant instability is discussed. Finally, a comment is made regarding the applicability to these materials of any model involving large one-dimensional fluctuations.

22559 **(ANL/NESC—390) CORGAM; unfolding of complex gamma-ray spectra.** Eckhoff, N.D. (Kansas State Univ., Manhattan (USA). Dept. of Nuclear Engineering). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048390.

Currently the program is restricted to a problem of 400 channels and 15 reference spectra. There would be no difficulty in expanding this to as many as 4096 channels. However, the number of reference spectra is limited by the accuracy desired in the inversion procedure. The inversion program currently being used would suffer (from the accuracy standpoint) if the number of reference spectra were greater than 25.

A correlation algorithm is coded to allow the unfolding of complex gamma-ray spectra typically collected in a neutron activation analysis procedure. CORGAM (1) will compensate for electronic shifts in the data, (2) will correct for background, (3) will normalize the data to a fixed neutron flux level, (4) allows a choice of weighting factors, and (5) allows a choice of methods for calculation of standard deviations. The code requires a matrix of reference gamma-ray spectra. These spectra can be in raw-data form. All of the modifications available to the complex gamma-ray spectra are available to the reference gamma-ray spectra. In addition, a decay correction is available for the reference gamma-ray spectra. Only the reference gamma-ray spectra that have intensity coefficients which are significant at a prescribed level of significance are retained in the final solution. The intermediate solutions, i.e., those solutions that contain reference gamma-ray spectra which have nonsignificant intensity coefficients at the prescribed level, are printed out. Therefore, several solutions are imbedded in the final solution.IBM360/50; FORTRAN IV Level G; OS/360.

22560 **(ANL/NESC—417) ATHENA4; inelastic scattering form factors.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Satchler, G.R. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048417.

Maxima of - 100 wave function components 10 interaction components The reduced matrix elements of the one-body multipole operators may be included automatically in the wave function coefficients. Non-local effects on the wave functions may be included in the local energy approximation.

ATHENA4 computes form factors for inelastic scattering calculations, using single-particle wave functions that are eigenstates of motion in either a Woods-Saxon potential well or a harmonic oscillator well. Two-body forces of Gauss, Coulomb, Yukawa, and a sum of cut-off Yukawa radial dependences are available.IBM360/75,91; FORTRAN IV; OS/360.

22561 **(DOE/ER/10651—T1-Vol.2) Lie-admissible approach to the hadronic structure. Volume II. Covering of the Galilei and Einstein relativities. Hadronic press monographs in theoretical physics Number 2.** Santilli, R.M. (Institute for Basic Research, Cambridge, MA (USA). Div. of Physics). Jul 1982. Contract AC02-80ER10651. 331p. NTIS, PC A15/MF A01. Order Number DE83007251.

Topics covered include: Lie-admissible algebras; Birkhoff-admissible covering of Hamilton's and of Birkhoff's equations; Lie-admissible covering of Lie's theory; symplectic-admissible covering of symplectic geometry; and generalization of Galilei and Einstein special relativity for closed systems with non-Hamiltonian internal forces. (GHT)

22562 **(LA-UR—83-333) Heuristic introduction to gravitational waves.** Sandberg, V.D. (Los Alamos National Lab., NM (USA)). 1982. Contract W-7405-ENG-36. 7p. (CONF-820989—5). NTIS, PC A02/MF A01. Order Number DE83007546.

From Workshop on science underground; Los Alamos, NM, USA (27 Sep 1982).

The purpose of this article is to provide a rough and somewhat heuristic theoretical background and introduction to gravitational radiation, its generation, and its detection based on Einstein's general theory of relativity.

22563 **(LA-UR—83-512) Multiple-scattering corrections to the Beer-Lambert law.** Zardecki, A. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. 9p. (CONF-830420—1). NTIS, PC A02/MF A01. Order Number DE83007564.

From Society of Photo-Optical Instrumentation Engineers conference; Arlington, VA, USA (4 Apr 1983).

The effect of multiple scattering on the validity of the Beer-Lambert law is discussed for a wide range of particle-size parameters and optical depths. To predict the amount of received radiant power, appropriate correction terms are introduced. For particles larger than or comparable to the wavelength of radiation, the small-angle approximation is adequate; whereas for small densely packed particles, the diffusion theory is advantageously employed. These two approaches are used in the context of the problem of laser-beam propagation in a dense aerosol medium. In addition, preliminary results obtained by using a two-dimensional finite-element discrete-ordinates transport code are described. Multiple-scattering effects for laser propagation in fog, cloud, rain, and aerosol cloud are modeled.

22564 **(UCID—18574-82-3) H-Division quarterly report, July-September 1982.** (Lawrence Livermore National Lab., CA (USA)). 31 Jan 1983. Contract W-7405-ENG-48. 55p. NTIS, PC A04/MF A01. Order Number DE83006274.

Topics covered include: theoretical studies on Hugoniots of polybutene and benzene; pseudopotential equation of state for solid and liquid sodium; Thomas-Fermi bag model for equation of state estimates; classical theory of ionization in plasmas; plasma screening effects on inelastic electron-ion collisions; the calculation of spectral line series emission including line broadening, line merging and ionization potential depression; blast attenuation in a shot tunnel using water jets; and specific heat data for liquid copper. (GHT)

22565 **(UCRL—88642) Review of quantum Monte Carlo methods and results for Coulombic systems.** Ceperley, D. (Lawrence Livermore National Lab., CA (USA)). 27 Jan 1983. Contract W-7405-ENG-48. 12p. (CONF-821166—1). NTIS, PC A02/MF A01. Order Number DE83006570.

From Monte Carlo methods in quantum problems conference; Paris, France (29 Nov 1982).

The various Monte Carlo methods for calculating ground state energies are briefly reviewed. Then a summary of the charged systems that have been studied with Monte Carlo is given. These include the electron gas, small molecules, a metal slab and many-body hydrogen.

22566 **Many-body theory in condensed matter physics.** de Llano, M. (Ames Laboratory USDOE and Department of Physics, Iowa State University, Ames, Iowa 50011 and Instituto de Fisica & Facultad de Ciencias, Universidad Nacional de Mexico, 01000 Mexico, DF, Mexico). *American Journal of Physics;* **51**: No. 3, 247-256(Mar 1983). Contract W-7405-ENG-82.

The nonrelativistic, continuous (as opposed to "spin") many-body problem as it relates to condensed matter at absolute zero temperature is reviewed in simple, nontechnical terms, mainly from the standpoint of infinite-order perturbation theory, for physical systems where all the particles have the same mass but which otherwise interact with arbitrary short- or long-range two-body forces.

22567 Random walks on the Bethe lattice. Hughes, B.D.; Sahimi, M. (Department of Chemical Engineering and Materials Science, University of Minnesota, Minneapolis, Minnesota 55455). *Journal of Statistical Physics;* **29**: No. 4, 781-812(Dec 1982).

We obtain random walk statistics for a nearest-neighbor (Polya) walk on a Bethe latttice (infinite Cayley tree) of coordination number z, and show how a random walk problem for a particular inhomogeneous Bethe lattice may be solved exactly. We question the common assertion that the Bethe lattice is an infinite-dimensional system.

22568 Staticial mechanics of red blood cells aggregation: The distribution of Rouleaux in thermal equilibrium. Wiegel, F.W.; Perelson, A.S. (Department of Applied Physics, Twente University of Technology, P. O. Box 217, Enschede, The Netherlands). *Journal of Statistical Physics;* **29**: No. 4, 813-878(Dec 1982).

When placed in suspension red blood cells adhere face-to-face and form long, cylindrical, and sometimes branched structures called rouleaux. We use methods developed in statistical mechanics to compute various statistical properties describing the size and shape of rouleaux in thermodynamic equilibrium. This leads to analytical expressions for (1) the average number of rouleaux consisting of n cells and having m branch points: (2) the average number of cells per rouleau; (3) the average number of branch points per rouleau; and (4) the number of rouleaux with n cells in a system containing a total of N cells. We also derive asymptotic formulas that simplify these analytic expressions, and present numerical comparisons of the exact and asymptotic results.

22569 Optimization of planar metallic nonrefracting transmission-grating profiles for mth-order intensity maximization in the soft-x-ray range. Tatchyn, R.; Csonka, P.L.; Lindau, I. (Standord Synchrotron Radiation Laboratory and Stanford Electronics Laboratorties, Stanford University, Stanford, California 94305). *Journal of the Optical Society of America;* **72**: No. 12, 1630-1638(Dec 1982).

We derive the thickness profiles of metallic transmission-grating bars that maximize either the power throughput into the mth diffracted order or the ratio of the mth-order diffracted power to the total output (in the soft-x-ray range). The derivation is performed for both general and symmetric bar shapes and for the two physically important cases of continuous gratings and gratings with integral bars. The analysis is valid for all cases in which the optical constants are general functions of position in a direction perpendicular both to the light and to the grating bars. Examples of some optimum profiles for gold in the soft-x-ray range are computed on the basis of the presented analysis and are tabulated for convenient reference.

22570 High-temperature free-energy expansion for metal fluids. Wallace, D.C.; Holian, B.L.; Johnson, J.D.; Straub, G.K. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physical Review [Section] A: General Physics;* **26**: No. 5, 2882-2885(Nov 1982).

The cluster expansion of the Helmholtz free energy is based on two-body interactions through a central potential phi(r). For a fluid at fixed density, it is shown that the cluster expansion provides a convergent high-temperature expansion of the free energy. Because phi(r) for a liquid metal depends explicitly on the density, the corresponding cluster expansion of the pressure differs from the ordinary virial series. For a physically realistic interaction, phi(r) is integrable at small r. From this it follows that the two-body-interaction contributions to thermodynamic functions for realistic fluids are bounded at high temperatures. In contrast, for potentials such as Lennard-Jones which are not integrable at small r, these thermodynamic contributions increase without limit as the temperature increases.

22571 Observation of a Pomeau-Manneville intermittent route to chaos in a nonlinear oscillator. Jeffries, C.; Perez, J. (Materials and Molecular Research Division, Lawrence Berkeley Laboratory, and Department of Physics, University of California, Berkeley, California 94720). *Physical Review [Section] A: General Physics;* **26**: No. 4, 2117-2122(Oct 1982).

For a driven nonlinear semiconductor oscillator which shows a period-doubling pitchfork bifurcation route to chaos, we report an additional route to chaos: the Pomeau-Manneville intermittency route, characterized by a periodic (laminar) phase interrupted by bursts of aperiodic behavior. This occurs near a tangent bifurcation as the system driving parameter is reduced by ϵ from the threshold value for a periodic window. Data are presented for the dependence of the average laminar length <l> on ϵ, and also on additive random noise voltage. The results are in reasonable agreement with the intermittency theory of Hirsch, Huberman, and Scalapino. The distribution P(l) is also reported.

22572 Experiments to measure the gravitational acceleration of antimatter. Goldman, T.; Nieto, M.M. (Los Alamos National Lab., NM (USA). Theoretical Div.). *Physics Letters, [Section] B;* **112**: No. 6, 437-440(27 May 1982).

It has never been directly experimentally demonstrated that antimatter is gravitationally attracted to matter. We discuss the theoretical and experimental situation, and propose a new experiment using antiprotons.

22573 Condition of vibrational stabilizability for a class of nonlinear systems. Meerkov, S.M. (Illinois Inst. of Tech., Chicago). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Automatic Control;* **AC-27**: No. 2, 485-487(Apr 1982). Contract AC02-80ER10709.

A notion of vibrational stabilizability for a class of nonlinear systems is introduced and analyzed.

22574 Chaotic attractors of an infinite-dimensional dynamical system. Farmer, J.D. (Univ. of California, Santa Cruz). *Physica D: Nonlinear Phenomena (Amsterdam);* **4**: No. 3, 366-393(Mar 1982).

The chaotic attractors of a delay differential equation are studied. The dimension of several attractors computed directly from the definition agrees to experimental resolution with the dimension computed from the spectrum of Lyapunov exponents according to a conjecture of Kaplan and Yorke. Assuming this conjecture to be valid, as the delay parameter is varied, from computations of the spectrum of Lyapunov exponents, roughly linear increase is observed from two to twenty in the dimension, while the metric entropy remains roughly constant. These results are compared to a linear analysis, and the asymptotic behavior of the Lyapunov exponents is derived.

22575 Statistical mechanical prediction of entropies and free energy functions for small clusters of atoms. Frurip, D.J. (Argonne National Lab., IL); Blander, M.; Chatillon, C. *ACS Symposium Series;* No. 179, 207-218(1982).

Previously successful correlations of thermodynamic data for various simple gaseous molecules are extended to larger molecules. In the statistical mechanical theory one calculates the nonelectronic entropy and free energy function with good precision using as input only the interatomic distance and atomic masses. The general class of molecules MX/sub n/ $(1 \leqq n \leqq 6)$ appears to follow the predictions of the theory. When known thermodynamic data for small homonuclear clusters of atoms, X/sub n/ $(n \leqq 8)$, are tested the resulting correlations with the MX/sub n-1/ data are relatively good, further confirming the insensitivity of the entropy to the exact form of the pair potential.

22576 Magnetic field, vector potential and their derivatives due to currents in closed polygons of wire. Lee, D.K. (Oak Ridge National Lab., TN). *Computer Physics Communications;* **25**: 181-191(1982). Contract W-7405-ENG-26.

A computer program is described which evaluates the magnetic field, the magnetic reactor potential and their partial derivatives for two types of magnetic sources: (1) current-carrying straight wire of finite length and (2) current-carrying closed polygon consisting of three or more straight wires of finite length. (SC)

22577 Nonlinear mode phenomenology for sine-Gordon breather excitations. Bishop, A.R. (Los Alamos Scientific Lab., NM). *Journal of Physics, A;* **14**: 1417-1430(1981).

Hamiltonians in one space dimensions of the phi-four and sine-Gordon classes are considered, emphasizing kink- and breather-like excitations. A calculation of classical dynamic structure factors based on a kink ideal gas phenomenology is reviewed in terms of the central peaks predicted. This phenomenological scheme is extended to include breather excitations. It is suggested that, for correlations of appropriate functions, the breather excitations can give rise to a low-frequency (central) response from their particle-like envelope and a high-frequency response from their internal oscillatory motions, in qualitative accord with molecular dynamics simulations.

22578 **Solutions of the Yvon-Born-Green equation for hard discs at very high densities.** Green, K.A. (Univ. of Tulsa, OK); Luks, K.D.; Kozak, J.J. *Molecular Physics;* **43**: No. 3, 685-696(1981).

The Yvon-Born-Green equation under the superposition closure is solved for a system of hard discs at very high densities. As was found previously for the case of hard spheres, a transition from damped oscillatory g/sup (2)/(x) functions to undamped periodic g/sup (2)/(x) functions is observed. Two distinct branches of solutions, both periodic, are observed beyond the transition point. A reexamination of the YBG equation for a system of hard spheres at very high densities reveals the same type of branching phenomenon, heretofore not fully identified for the dimensionality d = 3.

22579 **Thermodynamic equations for a black planet with nearest-neighbour surface Carnot interaction.** Sertorio, L. (California Univ. (USA). Theoretical Div.; Los Alamos Scientific Lab., NM (USA)). *Nuovo Cimento della Societa Italiana di Fisica, [Sezione] C;* **3**: No. 1, 37-44(Jan-Feb 1980).

This approach provides a quantitative description of the work efficiency of a compound system that has a natural separation between entropy-producing channels and the zero-entropy channel. Within this model a generalization is obtained of the concept of Carnot efficiency no longer between two infinite reservoirs but for a structure that has an internal dynamics put into motion by an external heat source.

22580 **Energy deposition in molecules resulting from multiple infrared photon absorption.** Reiser, C.; Steinfeld, J.I. (Massachusetts Inst. of Tech., Cambridge). *Optical Engineering;* **19**: No. 1, 002-009(Jan 1980). Contract AC02-76ET33056.

The most important factor determining the response of systems to high-intensity infrared radiation is the quantity of vibrational energy deposited in the absorbing molecules. Determination of this quantity is complicated by spatial nonuniformities in the infrared radiation fluence and by distributions over energy in the system. In this paper, we obtain expressions for the infrared fluence distribution in a focused Gaussian beam. This is combined with an empirical model for the excitation function <n>(phi) to calculate energy deposition for a range of parameters. These results are compared with available experimental data on dissociation yields for sulfur hexafluoride, and also to various approximate results. Finally, we consider the advantages and limitations of several possible experimental approaches to determining the absolute excitation level of molecules and microscopic energy distributions in the focal volume of the laser beam.

22581 **Relation between the local field at large distances from a charge or dipole and the dielectric constant.** Pollock, E.L. (Lawrence Livermore Lab., CA); Alder, B.J.; Pratt, L.R. *Proceedings of the National Academy of Sciences of the United States of America;* **77**: No. 1, 49-51(Jan 1980).

The local field at large distances from a charged or dipolar impurity in a nonpolar polarizable fluid is related to the dielectric constant of the medium. The predicted local field agrees accurately with molecular dynamics results. In contrast, the usual continuum theory prediction is only accurate to first order in the polarizability and leads to serious error for realistic values of the polarizability. At smaller distances these relations cannot be used to define a physically reasonable local dielectric constant and consequently the local field is more satisfactorily described in terms of a screening function.

22582 **Elementary principles of spectral distributions.** French, J.B. (Univ. of Rochester, NY). pp 1-16 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

It is a common observation that as we add particles, one by one, to a simple system, things get steadily more and more complicated. For example if the system is describable in shell-model terms, i.e., with a model space in which m particles are distributed over N single-particle states, then as long as m << N, the dimensionality increases rapidly with particle number. On the other hand, for the usual (1 + 2)-body Hamiltonian, the (m ≧ 2)-particle spectrum and wave functions are determined by operators defined in the one-particle space (for the single-particle energies) and the two-particle space (for the interactions). We may say then that the input information becomes more and more fragmented as the particle number increases, the fixed amount of information being distributed over more and more matrix elements. On the other hand there arise also new simplicities whose origin is connected with the operation of statistical laws. There is a macroscopic simplicity corresponding to the fact that the smoothed spectrum takes on a characteristic shape defined by a few parameters (low-order moments) of the spectrum. There is a microscopic simplicity corresponding to a remarkable spectral rigidity which extends over the entire spectrum and guarantees us that the fluctuations from uniformity in the spectrum are small and in many cases carry little information. The purpose of spectral-distribution theory, as applied to these problems, is to deal with the complexities by taking advantage of the simplicities.

22583 **Special topics in spectral distributions.** French, J.B. (Univ. of Rochester, NY). pp 91-108 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

We discuss two problems which relate to the foundations of the subject, and a third about asymptotic properties of spectral distributions. We give also a brief list of topics which should be further explored.

22584 **Averages of operators in finite Fermion systems.** Ginocchio, J.N. (Los Alamos Scientific Lab., NM). pp 109-127 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

The important ingredients in the spectral analysis of Fermion systems are the average of operators. In this paper we shall derive expressions for averages of operators in truncated Fermion spaces in terms of the minimal information needed about the operator. If we take the operator to be powers of the Hamiltonian we can then study the conditions on a Hamiltonian for the eigenvalues of the Hamiltonian in the truncated space to be Gaussian distributed. The theory of scalar traces is reviewed, and the dependence on nucleon number and single-particle states is reviewed. These results are used to show that a dilute non-interacting system will have Gaussian distributed eigenvalues, i.e., its cumulants will tend to zero, for a large number of Fermions. The dominant terms in the cumulants of a dilute interacting Fermion system are derived. In this case the cumulants depend crucially on the interaction even for a large number of Fermions. Configuration averaging is briefly discussed. Finally, comments are made on averaging for a fixed number of Fermions and angular momentum. (WHK)

22585 **Spectral distributions and symmetries.** Quesne, C. (Univ. Libre de Bruxelles, Belgium). pp 257-272 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

As it is now well known, the spectral distribution method has both statistical and group theoretical aspects which make for great simplifications in many-Fermion system calculations with respect to more conventional ones. Although both aspects intertwine and are equally essential to understand what is going on, we are only going to discuss some of the group theoretical aspects, namely those connected with the propagation of information, in view of their fundamental importance for the actual calculations of spectral distributions. To be more precise, let us recall that the spectral distribution method may be applied in principle to many-Fermion spaces which have a direct-product structure, i.e., are obtained by distributing a certain number n of Fermions over N single-particle states ($O \leqq n \leqq N$), as it is the case for instance for the nuclear shell model spaces. For such systems, the operation of a central limit theorem is known to provide us with a simplifying principle which, when used in conjunction with exact or broken symmetries, enables us to make definite predictions in those cases which are not amendable to exact shell model diagonalizations. The distribution (in energy) of the states corresponding to a fixed symmetry is then defined by a small number of low-order energy moments. Since the Hamiltonian is defined in few-particle subspaces embedded in the n-particlespace, the low-order moments, we are interested in, can be expressed in terms of simpler quantities defined in those few-particle subspaces: the information is said to propagate from the simple subspaces to the more complicated ones. The possibility of actually calculating spectral distributions depends upon the finding of simple ways to propagate the information. (WHK)

22586 **Group symmetries and information propagation.** Draayer, J.P. (Louisiana State Univ., Baton Rouge). pp 287-306 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

Spectroscopy concerns itself with the ways in which the Hamiltonian and other interesting operators defined in few-particle spaces are determined or determine properties of many-particle systems. But the action of the central limit theorem (CLT) filters the transmission of information between source and observed so whether propagating forward from a few-particle defining space, as is usual in theoretical studies, or projecting backward to it from measured things, each is only sensitive to averaged properties of the other. Our concern is with the propagation of spectroscopic information in the presence of good symmetries when filtering action of the CLT is effective. Specifically, we propose to address the question, What propagates and how. We begin with some examples, using both scalar and isospin geometries to illustrate simple propagation. Examples of matrix propagation are studied; contact with standard tensor algebra is established and an algorithm put forward for the expansion of any operator in terms of another set, complete or not; shell-model results for ^{20}Ne using a realistic interaction and two trace-equivalent forms are presented; and some further challenges are mentioned. (WHK)

22587 **Spectral methods applied to Ising models.** DeFacio, B. (Ames Lab., IA); Hammer, C.L.; Shrauner, J.E. pp 327-361 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980). Contract W-7405-ENG-82.

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

Several applications of Ising models are reviewed. A 2-d Ising model is studied, and the problem of describing an interface boundary in a 2-d Ising model is addressed. Spectral methods are used to formulate a soluble model for the surface tension of a many-Fermion system. (WHK)

22588 **Partition function as a Laplace transform of a positive measure in the strength parameter.** Bessis, D. (Centre d'Etudes Nucleaires de Saclay, France). pp 363-369 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

We shall consider the partition function Z(λ), of an N-body system whose Hamiltonian reads: H = H/sub O/ + λH/sub I/. H/sub O/ is an exactly solvable Hamiltonian, one for which, for example all thermodynamical quantities can be calculated. H/sub I/ is the perturbation. We are interested in the analytic properties in the strength parameter λ of the partition function Z(λ) = Tr e/sup -β[H_0 + λH/sub I/]/ where for convenience the volume V and inverse temperature β dependence has been suppressed on the left hand side. The representation for Z(λ) is given and discussed, and applications are described. (WHK)

22589 **Application of spectral distributions in effective interaction theory.** Chang, B.D. (Univ. of Pittsburgh, PA). pp 371-387 of Theory and applications of moment methods in many-fermion systems. Dalton, B.J.; Grimes, S.M.; Vary, J.P.; Williams, S.A. (eds.). New York, NY; Plenum Press (1980).

From Conference on theory and applications of moment methods in many fermion systems; Iowa City, IA, USA (10 Sep 1979).

The calculation of observable quantities in a large many-particle space is very complicated and often impractical. In effective interaction theory, to simplify the calculation, the full many-particle space is truncated to a small, manageable model space and the operators associated with the observables are renormalized to accommodate the truncation effects. The operator that has been most extensively studied for renormalization is the Hamiltonian. The renormalized Hamiltonian, often called the effective Hamiltonian, can be defined such that it not only gives the eigenvalues, but also the projections of the full-space (true) eigen-functions onto the model space. These projected wave functions then provide a convenient basis for renormalization of other operators. The usual framework for renormalization is perturbation theory. Unfortunately, the conventional perturbation series for effective Hamiltonians have problems with convergence and their high order terms (especially 4th or higher) are also difficult to calculate. The characteristics of spectral distributions can be helptul in determining the model space and calculating the effective Hamiltonian. In this talk applications of spectral distributions are discussed in the following areas: (1) truncation of many particle spaces by selection of configurations; (2) orthogonal polynomial expansions for the effective Hamiltonian; and (3) establishing new criteria for the effective Hamiltonian. 22590 **(DOE/ER/10651—T1-Vol.1) Lie algebras and flexible Lie-admissible algebras. Hadronic press monographs in mathematics Number 1.** Myung, H.C. (University of Northern Iowa, Cedar Falls (USA). Dept. of Mathematics; Institute for Basic Research, Cambridge, MA (USA). Div. of Physics). Nov 1982. Contract AC02-80ER10651. 338p. NTIS, PC A15/MF A01. Order Number DE83007252.

Topics covered includes: nonassociative algebras; polynomial mappings; Lie algebras of characteristic O; split semisimple Lie algebras of characterisitic O; representations of semisimple Lie algebras; flexible Lie-admissible algebras with A^- semisimple; and Lie-admissable algebras of arbitrary characteristic. (GHT)

22591 Boundary conditions for the numerical solution of elliptic equations in exterior regions. Bayliss, A. (Langley Research Center, Hampton, VA); Gunzburger, M.; Turkel, E. *SIAM (Society for Industrial and Applied Mathematics) Journal on Applied Mathematics;* **42**: No. 2, 430-451(Apr 1982). Contract AC02-76ER03077.

Elliptic equations in exterior regions frequently require a boundary condition at infinity to ensure the well-posedness of the problem. Examples of practical applications include the Helmholtz equation and Laplace's equation. Computational procedures based on a direct discretization of the elliptic problem require the replacement of the condition at infinity by a boundary condition on a finite artificial surface. Direct imposition of the condition at infinity along the finite boundary results in large errors. A sequence of boundary conditions is developed which provides increasingly accurate approximations to the problem in the infinite domain. Estimates of the error due to the finite boundary are obtained for several cases. Computations are presented which demonstrate the increased accuracy that can be obtained by the use of the higher order boundary conditions. The examples are based on a finite element formulation but finite difference methods can also be used.

22592 Solving symmetric-definite quadratic λ-matrix problems without factorization. Scott, D.S. (Univ. of Texas, Austin); Ward, R.C. *SIAM Journal on Scientific and Statistical Computing;* **3**: No. 1, 58-67(Mar 1982). Contract W-7405-ENG-26.

Algorithms are presented for computing some of the eigenvalues and their associated eigenvectors of the quadratic λ-matrix $M \lambda^2 C \lambda + K$. M, C, and K are assumed to have special symmetry-type properties which insure that theory analogous to the standard symmetric eigenproblem exists. The algorithms are based on a generalization of the Rayleigh quotient and the Lanczos method for computing eigenpairs of standard symmetric eigenproblems. Monotone quadratic convergence of the basic method is proved. Test examples are presented.

22593 Spectral methods for a nonlinear initial value problem involving pseudo differential operators. Pasciak, J.E. (Brookhaven National Lab., Upton, NY). *SIAM (Society for Industrial and Applied Mathematics) Journal on Numerical Analysis;* **19**: No. 1, 142-154(Feb 1982). Contract AC02-76CH00016.

Spectral methods (Fourier methods) for approximating the solution of a nonlinear initial value problem involving pseudo differential operators are defined and analyzed. A semidiscrete approximation to the nonlinear equation based on an L^2 projection is described. The semidiscrete L^2 approximation is shown to be a priori stable and convergent under sufficient decay and smoothness assumptions on the initial data. It is shown that the semidiscrete method converges with infinite order, that is, higher order decay and smoothness assumptions imply higher order error bounds. Spectral schemes based on spacial collocation are also discussed.

22594 Transient solutions of the Bloch equations for inhomogeneously broadened lines. Friesner, R.; McCracken, J.L.; Sauer, K. (Lawrence Berkeley Lab., CA). *Journal of Magnetic Resonance;* **43**: 343-356(1981). Contract W-7405-ENG-48.

The transient EPR response of a spin-polarized, inhomogeneously broadened line under conditions of magnetic field modulation is determined. Numerical solutions of the Bloch equations for spin packets with off-resonance Larmor frequencies are obtained. These solutions are then demodulated, averaged over the initial phase of the field modulation cycle and the distribution of resonant frequencies to obtain the experimentally observed lineshape. The results of these calculations are characterized for both slow and rapid passage conditions, and the effects of spin relaxation and experimental parameters on the signal-averaged output of the phase-sensitive detector are described.

70 FUSION ENERGY

22596 (AD-A—115329/5) XUV and x-ray spectra from Texas Experimental Tokamak plasmas. Memorandum report 1981-1982. Bleach, R.D.; Burkhalter, P.G.; Nagel, D.J.; Rowan, W. (Naval Research Lab., Washington, DC (USA)). 28 May 1982. 23p. (NRL-MR—4822). NTIS, PC A02/MF A01.

The first XUV and x-ray spectra were recorded from TEXT with a grazing-incidence grating spectrograph and new crystal spectrographs. Time and space-integrated data yielded a qualitative description of the plasma. Line radiation from O, Cr, Fe, and Ni ions were recorded and identified with the aid of ab initio atomic structure calculations.

22597 (CONF-811040—192) Driver options for steady-state tokamak reactors. Ehst, D.A. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01. Order Number DE83007858.

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

This paper presents results from two theoretical studies of wave-driven currents in large tokamaks. A lower hybrid (LH) system was designed in detail for STARFIRE, a full-scale commercial reactor. The results of this first study indicated that the LH system was workable from an engineering and maintenance viewpoint, but accessibility constraints on the wave prevented wave penetration to the high density plasma interior. In consequence, STARFIRE would have to operate with a hollow current density equilibrium which is stable at only moderate beta ($\beta = 0.067$). Generally speaking, the maximum stable beta increases as the plasma current increases and achieves a broad centrally peaked profile. Hence, to improve upon the STARFIRE results a survey of other wave drivers was conducted in order to identify those waves which more efficiently generate centrally-peaked current density. All calculations in this second study were applied to a demonstration tokamak power reactor (DEMO) which is similar to INTOR in size ($R = 5.2$ m, $a = 1.3$ m, $B_0 = 4.8$ T) but has a high current ($I = 9$ MA) and high beta ($\beta = 0.080$). The goal of our survey is to find which wave maximizes the net electrical power produced by the DEMO.

22598 (CONF-811040—194) Study of plasma-edge conditions for a commercial tokamak reactor. Boley, C.D.; Brooks, J.N. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01. Order Number DE83007699.

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

Particle and energy fluxes to the first wall and pumped limiter of a commercial-size tokamak power reactor have been studied with a one-dimensional, time-dependent plasma transport code. The plasma is operated in an enhanced radiation mode, with iodine as the high-Z impurity, whereby the transport power to the limiter is held to about half of the alpha-heating power. Recycling of neutral hydrogen and helium is followed in detail. The ion flux to the limiter and the neutral flux to the first wall are found to depend on the removal efficiency of the limiter/vacuum system. These fluxes also depend strongly on whether gas puffing or pellet injection is used for fueling.

22599 (DOE/ER/10676—3) Semi-empirical studies of atomic structure. Progress report, 1 July 1982-1 February 1983. Curtis, L.J. (Toledo Univ., OH (USA). Dept. of Physics and Astronomy). 1983. Contract AS05-80ER10676. 14p. NTIS, PC A02/MF A01. Order Number DE83006556.

A program of studies of the properties of the heavy and highly ionized atomic systems which often occur as contaminants in controlled fusion devices is continuing. The project combines experimental measurements by fast-ion-beam excitation with semi-empirical data parametrizations to identify and exploit regularities in the properties of these very heavy and very highly ionized systems. The increasing use of spectroscopic line intensities as diagnostics for determining thermonuclear plasma temperatures and densities requires laboratory observation and analysis of such spectra, often to accuracies that exceed the capabilities of ab initio theoretical methods for these highly relativistic many electron systems. Through the acquisition and systematization of empirical data, remarkably precise methods for predicting excitation energies, transition wavelengths, transition probabilities, level lifetimes, ionization potentials, core polarizabilities, and core penetrabilities are being developed and applied. Although the data base for heavy, highly ionized atoms is still sparse, parametrized extrapolations and interpolations along isoelectronic, homologous, and Rydberg sequences are providing predictions for large classes of quantities, with a precision that is sharpened by subsequent measurements.

22600 (DOE/ER/53131—T1) Quarterly technical status report, December 1, 1982-February 28, 1983. (Austin Research Associates, Inc., TX (USA)). 1983. Contract AC05-82ER53131. 19p. (I-ARA—83-U-16(ARA-481)). NTIS, PC A02/MF A01. Order Number DE83008367.

It was shown that for magnetic field strengths expected near the outer plasma edge of an INTOR device, for any passive magnetic material the linear response regime is well exceeded and the material would be completely saturated. Further, it was shown that nested shells of magnetic material is inferior to the use of a single magnetic shell. Finally, for realistic sizes the amount of field reduction obtainable is small. In summary, it was shown that use of passive magnetic material is not a viable means of obtaining field-free transport of ion beams.

22601 (DOE/ER/53134—1) Theory of rf heating of toroidal plasmas. (Auburn Univ., AL (USA). Dept. of Physics). 1982. Contract AS05-82ER53134. 75p. NTIS, PC A04/MF A01. Order Number DE83008267.

Principal accomplishments includes the completion of graphic output with color-coded multiple rays, a more extensive parameter study, a large new section of coding for focusing effects, an analytic study of a simple integrable system to help understand the failure of the WKB method at mode conversion layers, exploration of techniques for doing ray-tracing in a numerically computed equilibrium, introduction of the effects of oblique incidence on a 4th-order mode conversion problem, derivation of a Green function for a 6th-order mode conversion problem, derivation of a new system of equations governing arbitrarily high-order mode conversion layer, a new numerical technique for solving mode conversion problems, calculation of quasimode decay growth rates in the LHTOR code, a demonstration that quasimode decay may be a candidate to explain the observed lower-hybrid current drive high density cutoff, and installation of a Remote User Service Station (RUSS) for the MFECC Network.

22602 (DOE/ET/53016—80) Experimental observations of MHD instabilities in the high-beta tokamak Torus-II. Machida, M. (Columbia Univ., New York (USA)). 1982. Contract AC02-76ET53016. 105p. NTIS, PC A06/MF A01. Order Number DE83008131.

The CO_2 laser scattering and interferometry diagnostics have been used to study the MHD instabilities in the high-beta tokamak Torus-II. Detailed measurements of the density and density fluctuation profiles have been performed. In order to measure density fluctuations with wavelengths longer than 2 cm, an interferometric like, phase matching technique has been developed. The toroidal and poloidal mode numbers have been measured using a double-beam, two-position technique. Working at high-beta values, average $\beta \geqq 10\%$, we have found parameters where the growing instabilities are created or suppressed. The plasma lifetime for both cases is seen to be about the same and the loss of the plasma appears to be caused by the decay in the external fields. The growing instability parameters are within the MHD regime, and it only grows at the outer edge of the plasma. This is in agreement with the theoretical Ballooning mode instability. The frequency and mode number measurements also agree with the Kinetic theory description of Ballooning modes. The comparison with possible other modes, such as Tearing and Drift instabilities, is performed and the Ballooning growth rate is shown to be the best fit to the experimental values.

22603 (DOE/ET/53136—3) Theoretical aspects of mirror fusion. Annual progress report, 1 July 1982-31 March 1983. Nicholson, D.R.; Knorr, G.E. (Iowa Univ., Iowa City (USA). Dept. of Physics and Astronomy). Mar 1983. Contract AC02-82ER53136. 9p. NTIS, PC A02/MF A01. Order Number DE83007924.

The techniques of theoretical and computational plasma physics were applied to two important problems in mirror fusion. First, we have found that electron collisions with neutral gas play an important role in determining the leak width of a cusp confined plasma. Second, we have found that mirror plasmas are susceptible to parametric instabilities during electron cyclotron resonance heating.

22604 (GA-A—16984) Theory of lower-hybrid-current drive at low densities. Chan, V.S.; Liu, C.S.; McClain, F.W.; Rosenberg, M. (GA Technologies, Inc., San Diego, CA (USA)). Feb 1983. Contract AT03-76ET51011. 6p. (CONF-830210—1). NTIS, PC A02/MF A01. Order Number DE83006950.

From 5. topical conference on radio frequency plasma heating; Madison, WI, USA (21 Feb 1983).

Efficient toroidal current sustainment by LH waves has been demonstrated experimentally on a number of tokamaks at low densities. A theoretical model invoking the nonlinear excitation of magnetized plasma waves has been proposed to explain many interesting features observed in these experiments which include enhanced SXR, cyclotron emissions and electrostatic fluctattions. Analysis of a set of moment equations deduced from this analytical mode predicts the existence of relaxation oscillations in perpendicular temperature and plasma wave energy which have subsequently been observed experimentally in certain situations. Due to the excessive stiffness of the moment equations, it is not possible to ascertain the conditions under which relaxation oscillations will occur. It is thus necessary to resort to a detailed kinetic analysis. We have constructed a Fokker-Planck wave kinetic code which takes into account the nonlinear excitation of the plasma waves and follows the temporal evolution of these waves as well as the electron distribution during the RF current drive. Studies with the code show either relaxation oscillations or a steady-state with significantly higher plasma wave energy depending on rf power level. The details of this and other dependences and comparison with experiments will be reported.

Reprint of IPP-JET--6.

This report describes the Soft-X-Ray Diode Array Diagnostic System for JET. It was designed by the IPP under an Article 14 contract for Phase I. The diagnostics will be capable of measuring the Soft-X-ray emission from H and D plasmas in JET with high resolution in space and time. Two slot-hole cameras with 150 detectors viewing the same toroidal cross-section of the plasma are foreseen. Thin beryllium and aluminium filters in the line of sight of the detectors allow simultaneous measurements within different limits of the X-ray spectrum. Heavy shielding against neutron and gamma radiation is provided in order to reduce radiation induced signals and to increase detector lifetimes. The signals of 100 detectors can be simultaneously sampled with a sampling rate variable up to 250 KHz and stored in 12 bit memories of about 20 Kwords size.

22623 **(LA-UR—83-413) Two parallel formulations of particle-in-cell models.** Buzbee, B.L. (Los Alamos National Lab., NM (USA)). 1982. Contract W-7405-ENG-36. 10p. (CONF-8209107—1). NTIS, PC A02/MF A01. Order Number DE83007558.

From Workshop on algorithmically-specialized computer organizations; West Lafayette, IN, USA (27 Sep 1982).

This paper discusses parallel formulation of PIC models for master/slave architectures and ring architectures. Because interprocessor communication can be a decisive factor in the overall efficiency of a parallel system, we show how to divide these models into large granules that can be executed in parallel with relatively little need for communication. We also report measurements of speed-up obtained from experiments on the UNIVASC 1100/84 and the Denelcor HEP.

22624 (LA-UR—83-463) Spheromak heating with Alfven waves. Knox, S.O.; Spencer, R.L.; Tataronis, J.A.; Kieras, C.E. (Los Alamos National Lab., NM (USA); Wisconsin Univ., Madison (USA)). 1983. Contract W-7405-ENG-36. 5p. (CONF-830210—5). NTIS, PC A02/MF A01. Order Number DE83007562.

From 5. topical conference on radio frequency plasma heating; Madison, WI, USA (21 Feb 1983).

The temperature of present spheromak plasmas will need to be raised in order to test the feasibility of the confinement concept. In addition, a spatially-selective rf heating pulse can be used to study transport. As the ohmic heating power within a spheromak can be quite large (6-MW), low frequencies where large amounts of power are available are preferred. For the Los Alamos spheromak experiment CTX, we propose to add heating energy via a shear Alfven wave resonance. This resonance can be made to occur upon a particular flux surface, thus depositing most of the energy locally. A 2-dimensional equilibrium code (toroidally symmetric) is used to establish flux surfaces and magnetic field values for the desired configuration, either with or without plasma pressure.

22625 (LBL—15672) Eikonal theory of the transition to phase incoherence. Kaufman, A.N.; Rosengaus, E. (Lawrence Berkeley Lab., CA (USA)). Feb 1983. Contract AC03-76SF00098. 7p. (CONF-830210—6). NTIS, PC A02/MF A01. Order Number DE83008396.

From 5. topical conference on radio frequency plasma heating; Madison, WI, USA (21 Feb 1983).

When a monochromatic electromagnetic wave propagates through a nonuniform plasma (of n dimensions), its refraction may be studied in terms of its family of rays in 2n-dimensional phase space (k,x). These rays generate and n-dimensional surface. Imbedded in the phase space. The wave amplitude and phase are defined on this surface. As the rays twist and separate (from the dynamics of the ray Hamiltonian), the surface develops pleats and becomes convoluted. Projection of the surface onto x-space then yields a multivalued k(x). The local spectral density, as a function of k for given x, exhibits sharp spikes at these k(x), in the ray-optics limit. The next correction yields a finite width to these spikes. As the surface becomes more and more ppleated, these spectral peaks overlap; the spectrum changes qualitatively from a line spectrum to a continuous spectrum. Correspondingly, the two-point spatial correlation function loses its long-range order, as the correlation volume contracts. This phenomenon is what we call the transition to incoherence.

22626 (NASA-TM—81339) A numerical method for solving the Vlasov equation. Satofuka, N. (National Aeronautics and Space Administration, Moffett Field, CA (USA). Ames Research Center). Feb 1982. 23p. NTIS, PC A02/MF A01.

REFS.

A numerical procedure is derived for the solution of the Vlasov-Poisson system of equations in two phase-space variables. Derivatives with respect to the phase-space variables are approximated by a weighted sum of the values of the distribution function at property chosen neighboring points. The resulting set of ordinary differential equations is then solved by using an appropriate time intergration scheme. The accuracy of the proposed method is tested with some simple model problems. The results for the free streaming case, linear Landau damping, and nonlinear Landau damping are investigated and compared with those of the splitting scheme. The proposed method is found to be very accurate and efficient.

22627 (ORNL/Sub—7676/3) Research support for plasma diagnostics on Elmo Bumpy Torus. Observations of EBT ring geometry by means of diamagnetic field measurements using a compensated ferromagnetic resonance magnetometer, and a preliminary numerical study of EBT flux penetration dynamics. Carpenter, K.H.; Booker, R.H. (Missouri Univ., Rolla (USA). Dept. of Electrical Engineering). Oct 1982. Contract W-7405-ENG-26. 116p. NTIS, PC A06/MF A01. Order Number DE83007883.

A preliminary numerical study of flux penetration dynamics has been made assuming a bumpy cylinder geometry for the EBT vacuum vessel. Estimates made by this study show that the diamagnetic signal from the rings should penetrate the vacuum vessel in a time on the order of 100 mS when the plasma is changed. This penetration time appears qualitatively reasonable.

22628 (ORNL/TM—8553) Computer data-acquisition and control system for Thomson-scattering measurements. Stewart, K.A.; Foskett, R.D.; Kindsfather, R.R.; Lazarus, E.A.; Thomas, C.E. (Oak Ridge National Lab., TN (USA)). Mar 1983. Contract W-7405-ENG-26. 30p. NTIS, PC A03/MF A01. Order Number DE83008167.

The Thomson-Scattering Diagnostic System (SCATPAK II) used to measure the electron temperature and density in the Impurity Study Experiment is interfaced to a Perkin-Elmer 8/32 computer that operates under the OS/32 operating system. The calibration, alignment, and operation of this diagnostic are all under computer control. Data acquired from 106 photomultiplier tubes installed on 15 spectrometers are transmitted to the computer by eighteen 12-channel, analog-to-digital integrators along a CAMAC serial highway. With each laser pulse, 212 channels of data are acquired: 106 channels of signal plus background and 106 channels of background only. Extensive use of CAMAC instrumentation enables large amounts of data to be acquired and control processes to be performed in a time-dependent environment. The Thomson-scattering computer system currently operates in three modes: user interaction and control, data acquisition and transmission, and data analysis. This paper discusses the development and implementation of this system as well as data storage and retrieval.

22629 (TRITA-EPP—81-05) Very strong double layers in a magnetized plasma column. Torven, S. (Royal Inst. of Tech., Stockholm (Sweden)). Dec 1981. 18p. NTIS, PC A02/MF A01.

REFS.

Observations of double layers with potential drops up to 1000 V are reported. The experiments were done in a triple plasma device where a magnetized plasma column is maintained in the central chamber by two plasma sources. Axial potential profiles are presented as well as probe measurements, showing the existence of an energetic electron beam on the high potential side of the layer. Experimental evidence of the validity of the Langmuir condition is given. The double layers are stable for a wide range of parameter values, but instabilities leading to large amplitude fluctuations can be introduced.

22630 (TRITA-EPP—81-08) High frequency probe circuits for plasma diagnostics. Lindberg, L. (Royal Inst. of Tech., Stockholm (Sweden)). Dec 1981. 29p. NTIS, PC A03/MF A01.

REFS.

Probe circuits used in quantitative measurement of high frequency electric fields in plasmas are analyzed. Badly defined circuits are shown to respond partly to potential, partly to electric field fluctuations, thus giving ambiguous results. Twin probes for electric field measurements overcome this difficulty. The design and optimum operation of a high frequency interferometer is described as well as its use in measuring the dispersion function and degree of coherence of a field created by beam-plasma interaction.

22631 (UCID—19692) Review of intense-ion-beam propagation with a view toward measuring ion energy. Garcia, M. (Lawrence Livermore National Lab., CA (USA)). 25 Aug 1982. Contract W-7405-ENG-48. 68p. NTIS, PC A04/MF A01. Order Number DE83008204.

The subject of this review is intense ion beam propagation and the possibilities of measuring time dependent ion energy in the beam. Propagation effects discussed include charge separation, charge and current autoneutralization, electron thermalization and current neutralization decay. The interaction of a plasma beam with material obstacles, like collimators, and with transverse magnetic fields is also described. Depending on beam energy, density and pulse length, these interactions can include material ablation with plasmadynamic flow and undeflected propagation across transverse magnetic fields by a polarization drift. On the basis of this review I conclude that three diagnostics: a single floating potential probe, net current probes (Faraday cups) and a Rutherford scattering spectrometer appear capable of giving prompt, time dependent ion energy measurements.

22632 **(UCID—19731) Nonlocal Boltzmann theory of plasma channels.** Yu, S.S.; Melendez, R.E. (Lawrence Livermore National Lab., CA (USA)). 3 Jan 1983. Contract W-7405-ENG-48. 24p. NTIS, PC A02/MF A01. Order Number DE83008310.

The mathematical framework for the LLNL code NUTS is developed. This code is designed to study the evolution of an electron-beam-generated plasma channel at all pressures. The Boltzmann treatment of the secondary electrons presented include all inertial, nonlocal, electric and magnetic effects, as well as effects of atomic collisions. Field equations are advanced simultaneously and self-consistently with the evolving plasma currents.

22633 **(UCRL—88541) Experiments on hot-electron ECRH in the Tandem Mirror Experiment-Upgrade.** Stallard, B.W. (Lawrence Livermore National Lab., CA (USA)). 18 Feb 1983. Contract W-7405-ENG-48. 8p. (CONF-830210—4). NTIS, PC A02/MF A01. Order Number DE83007364.

From 5. topical conference on radio frequency plasma heating; Madison, WI, USA (21 Feb 1983).

Experiments have begun on the Tandem Mirror Experiment Upgrade (TMX-U) using electron-cyclotron resonant heating (ECRH) to generate the hot electron populations required for thermal barrier operation (Energy E/sub eh/ $\sim$ 50 keV, density n/sub eh/ < 5 x 10^{12}, and hot-to-cold fraction n/sub eh/n $\sim$ 0.9). For this operation, rf power produced by 28-GHz gyrotrons is injected with extraordinary mode polarization at both fundamental and second harmonic locations. Our initial experiments, which concentrated on startup of the hot electrons, were carried out at low density (< 1 x 10^{12} cm^{-3}) where Fokker-Planck calculations predict high heating efficiency when the electron temperature (T/sub e/) is low. Under these conditions, we produced substantial hot electron populations (diamagnetic energy $>$ 400 J, E/sub eh/ in the range of 15 to 50 keV, and n/sub eh//n $>$ 0.5).

22634 **Mass resolving charge-exchange system on the poloidal divertor experiment.** Davis, S.L.; Mueller, D.; Keane, C.J. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08540). *Review of Scientific Instruments;* **54**: No. 3, 315-327(Mar 1983). Contract AC02-76CH03073.

The charge-exchange system used on the Poloidal Divertor Experiment is comprised of four, ten-channel, mass-resolved, charge-exchange analyzers. Each analyzer is constructed with parallel electric and magnetic fields and is calibrated over an energy range of 0.5—40 keV. The mass rejection between hydrogen and deuterium has been measured as better than 1000 to 1. For Ohmic heated discharges the system can provide single shot radial ion temperature profiles (four point) with 1-ms time resolution. For neutral beam heated discharges, complete radial and temporal profiles can be obtained in two to four shots. The system is also equipped with a vertically aimed diagnostic neutral beam to allow local ion-energy distribution measurements. This report describes the analyzer system and its calibration, and presents results from Ohmic and neutral beam heated discharges.

22635 **Generation of plasma targets for a negative ion neutralizer.** Hershcovitch, A.I.; Kovarik, V.J. (Brookhaven National Laboratory, Associated Universities, Inc., Upton, New York 11973). *Review of Scientific Instruments;* **54**: No. 3, 328-331(Mar 1983).

Hollow cathode discharge plasmas have been generated in a closed-loop, D-shaped solenoidal magnetic field. This configuration, which is adequate to serve as a neutralizer in a negative ion based neutral beam line, was used to generate argon and hydrogen plasma neutralizer targets. Based on scaling of the observed power dependence of target thickness, this neutralizer concept should be very attractive for application to neutral beam systems.

22636 **Frozen magnetic flux in a tokamak discharge.** Osborne, T.H.; Dexter, R.N.; Prager, S.C. (Department of Physics, University of Wisconsin, Madison 53706). *Physics of Fluids;* **26**: No. 2, 350-351(Feb 1983).

The magnetic flux at the center and the safety factor profile are found to remain stationary (or frozen) during the rapid change in electron temperature that accompanies the sawtooth oscillation. This is consistent with the classical expectation.

22637 **Rigid ballooning modes in tandem mirrors.** Kaiser, T.B.; Nevins, W.M.; Pearlstein, L.D. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Physics of Fluids;* **26**: No. 2, 351-353(Feb 1983). Contract W-7405-ENG-48.

Stability of tandem mirrors to rigid-displacement ballooning modes is studied using vacuum field geometry. Results show substantial improvement in values of beta over those predicted by "infinite-m" theory. Previous work has shown that kinetic effects stabilize these latter short-wavelength modes, suggesting that only the rigid mode survives.

22638 **Observation of suprathermal electrons produced by stimulated Raman scattering processes.** Berger, R.G.; Brooks, R.D.; Pietrzyk, Z.A. (Aerospace and Energetics Research Program, University of Washington, Seattle, Washington 98195). *Physics of Fluids;* **26**: No. 2, 354-356(Feb 1983). Contract AS08-81DP40137.

Fast electrons (with $E >> T$/sub e/) have been observed as pulses correlated in time with stimulated Raman backscatter pulses during CO_2 laser interaction with cold underdense plasmas. Time-integrated electron spectra have a Maxwellian energy distribution, with discharge to discharge temperatures of 29—105 keV. Because the density is less than quarter critical and suprathermal electrons are seen only during discharges when stimulated Raman scattering occurs, it is concluded that Raman processes create the hot electrons.

22639 **Ion-cyclotron resonance heating in a strongly inhomogeneous magnetic field.** Nozaki, K.; Fried, B.D.; Morales, G.J.; Fukuyama, A. (University of California, Department of Physics, Los Angeles, California 90024). *Physics of Fluids;* **26**: No. 2, 487-495(Feb 1983).

Single particle ion-cyclotron resonance heating in a strongly inhomogeneous magnetic field with constant scale length κ^{-1} is studied for a uniform rf field. Because the ion-cyclotron frequency is energy dependent, ions get out of resonance, exhibiting superadiabatic response with no time-averaged energy gain. However, the anharmonicity of the motion results in resonances at multiple energy values, and for rf field amplitudes above a critical value E/sub c/, these resonances overlap, resulting in stochastic heating. Explicit analytic expressions are given for the particle orbits and for E/sub c/ as a function of energy and rf frequency.

22640 **Transport and isomorphic equilibria.** Boozer, A.H. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Physics of Fluids;* **26**: No. 2, 496-499(Feb 1983). Contract AC02-76CH03073.

It is shown that large classes of plasma equilibria can have identical drift orbits and associated transport. Such equilibria are called isomorphic. In particular, the neoclassical coefficients are given for all equilibria in which the magnetic field strength depends on one helicity.

22641 **Magnetohydrodynamic and double adiabatic stability of compact toroid plasmas.** Grossmann, W.; Hameiri, E.; Weitzner, H. (Courant Institute of Mathematical Sciences, New York University, New York, New York 10012). *Physics of Fluids;* **26**: No. 2, 508-519(Feb 1983). Contract AC02-76ER03077.

The linear stability of compact toroids is examined in the magnetohydrodynamic and double adiabatic models. The long-thin approximation in ideal magnetohydrodynamics is used to investigate tilting and shifting modes in field reversed configurations without toroidal fields. A necessary and sufficient condition is obtained and used to show that the combination of flux surface shaping and profile flatness results in stability to a class of transverse modes in a region about the O point. The double adiabatic model yields for general confined plasmas a sufficient condition for stability in the form of six ordinary differential equations along each field line. Further reduction of the condition to a single second-order equation depends on the sign of partialS/partialB, where S(psi,B) = p/sub parallel/B^5/p^3/sub perpendicular/ is a combination of the two entropies. Strong stabilizing effects of pressure anisotropy are shown.

22642 **Some minimum-energy toroidal equilibria.** Bhattacharjee, A.; Wiley, J.C. (Institute for Fusion Studies, The University of Texas at Austin, Austin, Texas 78712). *Physics of Fluids;* **26**: No. 2, 520-525(Feb 1983). Contract AC05-76ET53036;FG05-80ET53088.

Equilibria with minimum energy are constructed from a variational principle in which the energy of a plasma is minimized subject to a recently proposed set of global invariants. The equilibrium equation is solved in axisymmetric, toroidal geometry. In order to compute toroidal equilibria the variational principle is exploited to obtain a reduced set of ordinary differential equations which we solve numerically. Tokamaklike and pinchlike solutions of minimum energy are found in toroidal geometry. Based on the ideal and resistive stability studies of the cylindrical limit of these solutions, it is argued that some of these equilibria should have robust stability to modes of low m and n number.

22643 **Energy principle with global invariants: Applications.** Bhattacharjee, A.; Dewar, R.L.; Glasser, A.H.; Chance, M.S.; Wiley, J.C. (Institute for Fusion Studies, University of Texas at Austin, Austin, Texas 78712). *Physics of Fluids;* **26**: No. 2, 526-534(Feb 1983). Contract FG05-80ET53088.

Minimum-energy equilibrium states of a pressureless cylindrical plasma are constructed subject to a recently proposed set of constraints appropriate to turbulent relaxation dominated by a tearing mode of single helicity. Stability to ideal and resistive modes is examined. It is found that the relaxed states of minimum energy are always stable to the dominant mode, as well as a class of other low m and n modes, but that there are typically high n residual instabilities in the case of the pitch branch, and a residual m = 3, n = 2 resistive instability is found for an otherwise stable narrow window in the tokamak branch. It is argued that the residual instabilities may be compatible with experimental observations.

22644 **Confinement of a high-beta plasma column.** Brunel, F.; Tajima, T. (Institute for Fusion Studies, University of Texas at Austin, Austin, Texas 78712). *Physics of Fluids;* **26**: No. 2, 535-544(Feb 1983). Contract AM03-76SF00010.

Hydromagnetic aspects of confinement of a high-beta linear plasma column, including the reverse field configurations, are investigated. The previous theoretically predicted diverging confinement time of a sharp-boundary plasma column as $\beta \rightarrow 1$ is removed by properly taking into account the magnetic tension effect near the column throats. The obtained end loss rate is tested through simulation: the present simulation results in slab geometry are in good agreement with theory and are also close to other simulation and experimental values. The confinement time tau of a plasma with thickness a and length L at $\beta = 1$ is found to be tau = 3/4 (3/2π)/sup 1/2/(L/2c/sub s/)(L/a)/sup 1/2/. When the magnetic field inside the column is reversed, the plasma end loss much improves: the end loss induces the reconnection of the field lines near the throats, which produces closed field lines (islands). Those islands are found to be unstable against the tilting instability. The tilting-induced reconnection of the island field line and the mirror field line is a very fast process even for negligibly resistive plasmas and this helps to rapidly spill out the plasma confined in the islands. The significance of these processes for the spheromaks and reversed field (theta) pinches is discussed.

22645 **Gyrokinetic approach in particle simulation.** Lee, W.W. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Physics of Fluids;* **26**: No. 2, 556-562(Feb 1983). Contract AC02-76CH03073.

A new scheme for particle simulation based on the gyrophase-averaged Vlasov equation has been developed. It is suitable for studying linear and nonlinear low-frequency microinstabilities and the associated anomalous transport in magnetically confined plasmas. The scheme retains the gyroradius effects but not the gyromotion; it is, therefore, far more efficient than conventional ones. Furthermore, the reduced Vlasov equation is also amenable to analytical studies.

22646 **Determination of electron and ion thermal conductivities by analysis of Alcator-A profile data.** Liewer, P.C.; Pfeiffer, W.; Waltz, R.E. (Department of Applied Physics, California Institute of Technology, Pasadena, California 91125). *Physics of Fluids;* **26**: No. 2, 563-570(Feb 1983). Contract AM03-76SF00767.

Profile data from the Alcator-A tokamak are analyzed using the onetwo transport code to study thermal conductivities and power balance. It is found that the observed central ion temperatures can be explained by assuming an ion thermal conductivity equal to the neoclassical value as calculated recently by Bolton and Ware. For low density, n-bar = 1 x 10^{14} cm^{-3}, the possible anomaly in the ion conductivity is small: +- 30% of the Bolton—Ware value. The anomalous electron thermal conductivity as deduced from the profile data is <K/sup exp//sub e/> = <nchi/sup exp//sub e/> ≅2.5(+- 1.5) x 10^{17} cm^{-1} sec^{-1}. The power balance study shows that at low densities, electron energy losses from radiation and thermal conduction are equally important, and both are larger than the exchanges loss to the ions. At higher densities, n-bar> or =2 x 10^{14} cm^{-3}, electron energy losses by thermal conduction and exchange are equally important, and both are larger than the radiation loss. Convective losses, as calculated from measured particle confinement times, are negligible for all densities analyzed.

22647 **Time-resolved observations of stimulated Raman scattering from laser-produced plasmas.** Turner, R.E.; Phillion, D.W.; Campbell, E.M.; Estabrook, K. (University of California, Lawrence Livermore National Laboratory, Livermore, California 94550). *Physics of Fluids;* **26**: No. 2, 579-581(Feb 1983). Contract W-7405-ENG-48.

Temporally and spectrally resolved measurements of stimulated Raman scattering from high-intensity, 0.532 μm laser—plasma experiments on disk targets are reported. The observed scattering is principally from densities below quarter-critical, and is observed to occur nearly simultaneously over a wide range of wavelengths (0.72 $\mu m < \lambda < 0.9$ μm), in short (<50 psec) bursts. Several possible explanations of these data are briefly discussed.

22648 **Frequency-shift of self-trapped light.** Langdon, A.B.; Lasinski, B.F. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Physics of Fluids;* **26**: No. 2, 582-587(Feb 1983). Contract W-7405-ENG-48.

A decrease in the frequency of self-trapped light by as much as a factor of two has been observed in computer simulations of several physical situations. The frequency shift is due to a decrease in the resonant frequency of the plasma cavity as it deepens and expands shortly after the light becomes trapped. Three examples are presented: a model problem in an initially uniform plasma, trapping of laser light in cavities at critical density, and modulational instability and self-trapping of Raman-scattered light at quarter-critical density in a nonuniform, expanding plasma. This effect is essential in the analysis of the evolution and stability of such cavities, and such large frequency changes limit the applicability of models using a nonlinear Schroedinger equation to represent the high-frequency fields.

22649 **Method and apparatus for the formation of a spheromak plasma.** Furth, H.P.; Stix, T.H.; Todd, A.M.; Yamada, M. (to Dept. of Energy). US Patent 4,363,776. 14 Dec 1982. Filed date 30 Jul 1980. vp.

PAT-APPL-173555.

A method and apparatus for forming a detached, compact toroidally shaped spheromak plasma by an inductive mechanism. A generally spheroidal vacuum vessel houses a toroidally shaped flux ring or core which contains poloidal and toroidal field generating coils. A plasma discharge occurs with the pulsing of the toroidal field coil, and the plasma is caused to expand away from the core and toward the center of the vacuum vessel. When the plasma is in an expanded state, a portion of it is pinched off in order to form a separate, detached spheromak plasma configuration. The detached plasma is supported by a magnetic field generated by externally arranged equilibrium field coils.

22650 **Influence exerted by the plasma edge potential on recycling, sputtering and impurity accumulation.** Oren, L.; Keller, L.; Schwirzke, F.; Talmadge, S.; Taylor, R.J. (California Univ., Los Angeles (USA). Center for Plasma Physics and Fusion Engineering). *Journal of Nuclear Materials;* **111**: 34-38(Nov-Dec 1982). Contract AM03-76SF00010.

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

Control of the plasma edge potential appears to influence the overall impurity evolution and transport in a tokamak. The plasma in Macrotor usually assumes a positive potential with respect to the wall. Reversed radial electric fields can be set up by biasing the magnetic surfaces at the edge negative. The resulting negative potential well of up to -800 V is rather uniform in toroidal and poloidal directions. Impurities are observed to accumulate in the plasma with no sign of recycling under these conditions. Steady state is only observed for positive potentials accompanied by sputtering and rapid recycling.

22651 **Edge plasma transport experiments in the Caltech tokamak.** Zweben, S.; Liewer, P.C.; Gould, R.W. (California Inst. of Tech., Pasadena, CA (USA). Dept. of Applied Physics). *Journal of Nuclear Materials;* **111**: 39-43(Nov-Dec 1982).

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

This paper describes two experiments on edge plasma transport in the Caltech Research Tokamak (Bsub(T) = 4 kG, R = 45 cm, a = 15 cm, T(edge) approx. equal to 25 eV, n(edge) approx. equal to 2 x 10^{12} cm^{-3}). The first aims to understand the mechanism of edge plasma cross-field transport by attempting to measure with Langmuir probes the local E tilde and n and their correlation in order to compute the fluctuation-induced particle flux GAMMAsub(rad) = c x <E tildesub(pol) x n >/Bsub(T). The second experiment aims at demonstrating control of the plasma-limiter interaction through use of a local divertor coil mounted inside the limiter itself.

22652 **Impurity-induced desorption mechanism for releasing light impurities in Tokapole II.** Brickhouse, N.S.; Dexter, R.N. (Wisconsin Univ., Madison (USA)). *Journal of Nuclear Materials;* **111**: 50-55(Nov-Dec 1982).

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

The release mechanism for light impurities in Tokapole II, a tokamak with a four-node poloidal divertor, has been characterized through impurity gas puffing experiments. The desorption process responsible for the light impurity concentrations during the current-rise phase of the discharge depends on the mass of the particles in the discharge. During switch-over from H_2 to D_2 filling gas the oxygen concentration increases as the deuterium-to-hydrogen ratio increases. Puffing with small but increasing amounts of any gas studied (H_2, D_2, He, N_2, O_2, Ne, Ar, Kr, Xe) usually produces linear increases in the early-time radiation of O, C, and N. These impurity increases are proportional to the mass of the injected impurity as might be expected for a momentum transfer process. O and N signals increase faster than linearly with concentration of O_2 and N_2, respectively, since both dopant-induced desorption and direct population of the plasma and wall occur. A model for early-time desorption is discussed.

22653 **Dye laser fluorescence spectroscopy on the Doublet III tokamak.** Muller, C.H. III; Eames, D.R.; Burrell, K.H. (General Atomic Co., San Diego, CA (USA)); Bates, S.C. (Oak Ridge National Lab., TN (USA)). *Journal of Nuclear Materials;* **111**: 56-60(Nov-Dec 1982).

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

Measurements of edge-region TiI impurity densities and central-region deuterium (n = 2) densities have been obtained in the Doublet III tokamak using laser-induced fluorescence spectroscopy. TiI densities range from 10^{12} to 10^{13} m^{-3} in ohmically heated D_2 discharges and a factor of 2-5 times less in H_2 discharges. Edge-region TiI equilibration times following neutral-beam injection are in good agreement with central-region ion confinement times suggesting that energetic charge-exchange neutrals from the plasma center are responsible for TiI impurities. Resonance fluorescence scattering from deuterium atoms in the plasma center has been observed using a broadband (8 nm) dye laser source and a narrow band detector to investigate the feasibility of determining ion temperatures.

22654 **Measurement of the density and velocity distribution of sputtered Al in EBT-S by laser-induced fluorescence.** Dullni, E.; Hintz, E. (Bochum Univ. (Germany, F.R.); Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.)); Roberto, J.B.; Colchin, R.J.; Richards, R.K. (Oak Ridge National Lab., TN (USA)). *Journal of Nuclear Materials;* **111**: 61-66(Nov-Dec 1982). Contract W-7405-ENG-26.

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

The density and the velocity distribution of neutral Al released from the vacuum wall in the EBT-S fusion device have been measured using laser-induced fluorescence. Al I was excited at the 308 nm resonance transition using a frequency-doubled dye laser. Absolute Al-densities (approx. equal to $10^{8}/cm^{3}$) were determined at distances between 5 cm and 14 cm from the wall and for various plasma conditions, by comparison of the intensity of induced fluorescence with that obtained from Rayleigh scattering. Al-velocity distributions perpendicular to the wall were determined by scanning the laser through the Doppler-broadened absorption line. The influence of geometry and ionization on the shape of the distributions is given special attention to. From these distributions mean velocities were derived (approx. equal to 2.6 x 10^{5} cm/s), and along with the measured densities Al-fluxes were calculated. The results indicate sputtering, the possible mechanisms of which are discussed.

22655 **Infrared thermometer for tokamak limiter surface temperature measurements.** Ulrickson, M.; Pearson, G.G. (Princeton Univ., NJ (USA). Plasma Physics Lab.). *Journal of Nuclear Materials;* **111**: 91-94(Nov-Dec 1982).

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

A device has been constructed which achieves about 7 ms time response for taking two dimensional limiter surface temperatures in the range 100°C to 3000°C. The instrument is capable of two color measurements which permits in situ determination of the infrared emissivity under the restrictions discussed above. The accuracy and temporal response are adequate for tokamak experiments.

22656 **Calorimeter probe studies of PDX and PLT.** Manos, D.M.; Budny, R.; Satake, T.; Cohen, S.A. (Princeton Univ., NJ (USA). Plasma Physics Lab.). *Journal of Nuclear Materials;* **111**: 130-136(Nov-Dec 1982).

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

Using a combined electrostatic-calorimeter probe, a comprehensive survey of energy flux in the edge plasmas of low field ohmic and beam-heated PDX and PLT discharges has been made. Ions are shown to carry the majority of the power to floating probes. The intercepted energy is found to increase nearly linearly with applied heating power. The scrape-off distances, ranging from 0.5 cm for a 4 null diverted discharge to 2.5 cm for inside dee diverted discharge, are independent of heating power. Direct evidence is presented for the prompt loss to the walls and limiters in PDX of energetic beam ions.

22657 **Determination of species yield of ion sources used for intense neutral beam injector.** Tsai, C.C.; Barnett, C.F.; Haselton, H.H.; Langley, R.A.; Stirling, W.L. (Oak Ridge National Lab., TN (USA). Fusion Energy Div.). *Journal of Nuclear Materials;* **111**: 153-158(Nov-Dec 1982). Contract W-7405-ENG-26.

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

For efficient plasma heating, ion sources of neutral beam injectors should be capable of producing ion beams with an atomic fraction of 90% or higher. Diagnostic techniques for quantitatively determining source species yield have been developed and evaluated. These include a magnetic momentum analysis of the unneutralized ions passing through the neutralizer, an energy analysis of the atomic beam by electrostatic separation of ions emanating from a stripping cell, and a quantity versus implantation depth analysis of hydrogen implanted in a crystal by the Secondary Ion Mass Spectrometer (SIMS) technique. The operational features and the advantages and disadvantages of each technique will be discussed. If the effects of beamlet optics, energy straggling in the accelerator, and neutralizer gas scattering are taken into account, the results of the measurements using the three techniques are shown to be mutually consistent within experimental error.

22658 **Deposition probe measurements in EBT-S.** Zuhr, R.A.; Clausing, R.E.; Heatherly, L.; Richards, R.K. (Oak Ridge National Lab., TN (USA)). *Journal of Nuclear Materials;* **111**: 177-179(Nov-Dec 1982). Contract W-7405-ENG-26.

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

Aperture transmission onto deposition probe substrates has been shown to be a useful technique for plasma edge measurements even on a machine of relatively low ion energy like EBT-S. Although the method was not sensitive enough to completely unfold the ion energy distribution, a good fit to the data was achieved using a 20 eV Maxwellian with a 3 kT sheath potential. Thus the technique was used to make the first determination of ion flux and energy (approx. equal to 1 x 10^{17}/cm^2 s at 20 eV, Maxwellian) at the outer edge of the EBT plasma, resulting in a density of approx. equal to 1 x 10^{11}/cm^3, which is in reasonable agreement with edge densities anticipated from line average densities of approx. equal to 1 x 10^{12}/cm^3 as measured by microwave interferometry.

22659 **N-dependence in the classical one-component plasma Monte Carlo calculations.** Slattery, W.L.; Doolen, G.D.; DeWitt, H.E. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physical Review* [*Section*] *A: General Physics;* **26**: No. 4, 2255-2258(Oct 1982).

We calculate the internal energy of the classical one-component plasma using a Monte Carlo technique for 128, 250, 432, 686, and 1024 particles for $1<\Gamma<300$ in order to determine the effect of a differing number of particles on the thermodynamics. By fitting the internal energy to a function of Γ and N (the particle number), we find the free energy for both the liquid and solid for an infinite number of particles.

22660 **Laser-wavelength dependence of mass-ablation rate and heat-flux inhibition in laser-produced plasmas.** Fabbro, R.; Fabre, E.; Amiranoff, F.; Garban-Labaune, C.; Virmont, J.; Weinfeld, M.; Max, C.E. (Groupe de Recherches Coordonnees I.L.M., Laboratoire de Physique des Milieux Ionises, Ecole Polytechnique, 91128 Palaiseau Cedex, France). *Physical Review* [*Section*] *A: General Physics;* **26**: No. 4, 2289-2292(Oct 1982).

Thin-foil experiments at 1.06, 0.53, and 0.26 μm have been realized in order to measure mass-ablation rate m^0 as a function of absorbed laser flux phi/sub a/ and laser wavelength λ. The results can be put in the form m^0(kg/s cm^2)roughly-equal110 [phi/sub a/ (W/cm^2)/10^{14}]/sup 1/3/ λ/sup -4/3//sub mum/. Hydrodynamical simulations of these experiments show that heat-flux inhibition occurs at each wavelength, but the mechanisms are very different.

22661 **VMOMS - A computer code for finding moment solutions to the Grad-Shafranov equation.** Lao, L.L.; Wieland, R.M.; Houlberg, W.A.; Hirshman, S.P. (Oak Ridge National Lab., TN (USA)). *Computer Physics Communications;* **27**: No. 2, 129-146(Aug 1982).

This code finds approximate solutions to the Grad-Shafranov equation describing scalar pressure-balance equilibria for axisymmetric tokamak plasmas. A Fourier series expansion of the flux surface coordinates (R, Z) is made in terms of two new coordinate (rho, theta), and the resulting equation is convenieF reduced to a system of ordinary differential equations (ODE's) using a variational principle. The solution of these simple equations with pressure and current as driving functions yields, in principle, a complete description of the equilibrium.

22662 **One and one and one half dimensional profile calculations in torodial plasmas.** Baxter, D.C.; Byrne, R.N. (Science Applications, Inc., P.O. Box 2351, La Jolla, CA 92037). *Transactions of the American Nuclear Society;* **41**: 319(Jun 1982). (CONF-820609—).

From American Nuclear Society annual meeting; Los Angeles, CA, USA (6 Jun 1982).

22663 **Finite temperature and wall effects on the absorption of electron cyclotron waves in an EBT plasma.** Uckan, T. (Oak Ridge National Lab., TN). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Plasma Science;* **PS-9**: No. 3, 96-101(Sep 1981). Contract W-7405-ENG-26.

The absorption of electron cyclotron waves propagating along an externally applied magnetic field in a uniform plasma surrounded by a cylindrical metallic cavity wall is studies. In the model, the cavity wall, the vacuum-plasma interface, and the effects of finite electron temperature are considered, and the dispersion relation for the wave propagation is derived. The results are than applied to the ELMO Bumpy Torus (EBT-I) plasma, and the propagation characteristics are computed. The wave absorption in the ordinary mode is found to be a result of the wall effects, which cannot be predicted with the infinite plasma theory. The loaded quality factor Q/sub L/ is also estimated from the model to be about 14, which is in good agreement with the experimentally observed value.

22664 **Alternative lines with magnetic plasma confinement.** Wobig, H. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). pp vp of Annual meeting on nuclear technology '81. Specialists' meeting: Fusion. Eggenstein-Leopoldshaften, Germany; Fachinformationszentrum Mathematik (1981). (In German)

From Annual meeting on nuclear technology; Dusseldorf, F.R. Germany (24 Mar 1981).

Plasma confinement with the aid of a magnetic field is the most common and also the most frequently investigated principle on the way to controlled nuclear fusion. Apart from the Tokamak principle, which is the most advanced principle as far as fusion-relevant plasma parameters are concerned, also other approaches are being investigated, e.g. the mirror device, the bumpy tons, and the stellarator. In principle, all three concepts permit 'stationary' plasma confinement in a stationary fusion reactor. Compared with the pulsed Tokamak reactor, this is a considerable advantage. (orig./GG).

22665 Neutral-beam-induced alteration in impurity transport. Burrell, K.H. pp 113-115 of IAEA Technical Committee meeting on divertors and impurity control. Keilhacker, M.; Daybelge, U. (eds.). Garching, Germany; Max-Planck-Institut fuer Plasmaphysik (1981).

From IAEA Technical Committee meeting on divertors and impurity control in tokamaks; Garching (Germany, F.R.) (6 - 9 Jul 1981).

One of the techniques proposed for expelling impurities from plasma is based on the use of the momentum from a neutral beam. The purpose of the present work is to review the experimental results and then set forth an extension of the rotation theory that seems to be able to match the data qualitatively and quantitatively. (This theory contains no free parameters.) As a serendipitous result, this theory, coupled with the neoclassical theory of intrinsic plasma rotation, appears to be able to explain the difference between the long term confinement of injected silicon in Ohmic ISX-B discharges and the much shorter confinement seen in ALCATOR A.

22666 Impurity transport in the ISX-B tokamak. Isler, R.C.; Murray, L.E.; Kasai, S.; Sheffield, J. pp 128 of IAEA Technical Committee meeting on divertors and impurity control. Keilhacker, M.; Daybelge, U. (eds.). Garching, Germany; Max-Planck-Institut fuer Plasmaphysik (1981).

From IAEA Technical Committee meeting on divertors and impurity control in tokamaks; Garching (Germany, F.R.) (6 - 9 Jul 1981).

Recent theoretical calculations indicate that co-injection of neutral beams can inhibit impurity accumulation, but counter-injection can enhance accumulation.

22667 Helium transport experiments in PLT. Chrien, R.E.; Eubank, H.P.; Meade, D.M.; Strachan, J.D. pp 132 of IAEA Technical Committee meeting on divertors and impurity control. Keilhacker, M.; Daybelge, U. (eds.). Garching, Germany; Max-Planck-Institut fuer Plasmaphysik (1981).

From IAEA Technical Committee meeting on divertors and impurity control in tokamaks; Garching (Germany, F.R.) (6 - 9 Jul 1981).

The central ^{3}He density was deduced from the ratio of the measured ^{3}He(d,p)α and d(d,d(d,n)^{3}He fusion reaction rates during deuterium neutral beam injection into PLT plasmas.

22668 Rf-assisted current startup in FED. Borowski, S.K.; Peng, Y.K.M.; Kammash, T. (Oak Ridge Natl Lab, TN, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 507-510(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

Auxiliary rf heating of electrons before and during the current rise phase in FED is examined as a means of reducing both the initiation loop voltage and resistive flux expenditure during startup. Prior to current initiation, 1 to 2 MW of electron cyclotron resonance heating (ECRH) power at approximately 90 GHz is used to create a small volume of high conductivity plasma near the upper hybrid resonance (UHR) region. This plasma conditioning permits a small radius (a/sub o/ approximately 0.2-0.4 m) current channel to be established with a relatively low initial loop voltage (<25 V). During the subsequent plasma expansion and current ramp phase, additional rf power is introduced to reduce volt-second consumption due to plasma resistance. The physics models used for analyzing the UHR heating and current rise phases are also discussed.

22669 Plasma engineering analyses of tokamak reactor operating space. Houlberg, W.; Attenberger, S.E. (Oak Ridge Natl Lab, TN, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 688-691(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

A comprehensive method is presented for analyzing the potential physics operating regime of fusion reactor plasmas with detailed transport codes. Application is made to the tokamak Fusion Engineering Device (FED). The relationships between driven and ignited operation and supplementary heating requirements are examined. The reference physics models give a finite range of density and temperature over which physics objectives can be reached. Uncertainties in the confinement scaling and differences in supplementary heating methods can expand or contract this operating regime even to the point of allowing ignition with the more optimistic models.

22670 Plasma losses from a magnetic well. Kutbi, I.I.; Valfells, A. (Iowa State Univ, Ames, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 704-707(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The particle losses from a magnetic well having an octahedral symmetry are considered. The cusp, classical diffusion, and Bohm diffusion losses are computed. Results show that: Cusp losses can be compensated for by ion beam in the Hershkowitz equation prevails. Otherwise, the losses will have to be diminished by some other means; Classical diffusion losses are relatively small; and Bohm diffusion losses are very large, should it prevail, but that is unlikely to be the case in the configuration under consideration.

22671 Production of hollow gas cylinder and pulsed gas insulated discharge. Miyamoto, T.; Yoshioka, N.; Sogo, N.; Sato, M.; Kobatga, T. (Nihon Univ, Tokyo, Japan). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1905-1908(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

A method to create a hollow gas cylinder with a high density gradient using supersonic gas flows is pressure gas cylinder which is transient but steady enough for a pulsed discharge.

22672 Electrical design of a multi-channel far infrared interferometer for TFTR. Anderson, H.; Johnson, L.C.; Mansfield, D.K. (Princeton Univ, NJ, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1063-1066(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The Multichannel Far Infra-Red Interferometer (MIRI) is one of the many diagnostics on TFTR. It will be used to simultaneously measure line average electron density and poloidal field distributions along ten vertical chords at a single azimuthal location. Maximum expected values are 5 x 10/sup 1/4 electrons/cm/sup 3/ and /plus or minus/5 x 10/sup 3/ Gauss (+35?20/degree/Faraday rotation). This paper describes the design of the MIRI control and processing electronics.

22673 Miri - a multichannel far infra-red interferometer for TFTR. Foote, V.S. (Princeton Univ, NJ, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1067-1070(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

One of the primary diagnostics for TFTR will be a far infrared (119/mu/m) interferometer to provide temporally and spatially resolved measurements of electron density along ten vertical chords through the plasma in one radial plane. In addition, the system will provide means for measuring poloidal field distributions by detecting the plasma-induced Faraday rotation of the polarized probing beams. The optical and mechanical arrangement of this diagnostic are briefly described, showing its evolution from the single-channel prototype in successful operation on the PDX device at Princeton.

22674 Mechanical design of epithermal neutron diagnostic for TFTR. Groo, R.C. (Princeton Univ, NJ, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1082-1085(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The mechanical design of the Epithermal Neutron Diagnostic for TFTR is described. This fission detector system measures the time resolution of the neutron flux for folding into the Neutron Activation system and also provides continuous, wide range coverage of all expected fusion reaction rates.

22675 Diagnostics for TFTR first plasma. Goldfarb, S.; Young, K.M. (Princeton Univ, NJ, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* No. 81, 1106-1109(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

TFTR will be operated initially with ohmic heating only. During the first year, as additional equipment comes into operation, the plasma parameters will improve with a plasma current of about 1 MA anticipated before installation of neutral beam heating. The diagnostics described in this paper provide the information necessary for interpreting plasma properties and for verifying diagnostic interfaces for the full diagnostic system of which these diagnostics are a subset. A further, but less important, objective is that initial diagnostics be installed easily, because of the short time scheduled for this activity between tokamak vacuum tests and first plasma. The diagnostics selected for initial operation of TFTR are listed with a statement of function and status at first plasma. The initial configuration of TFTR is briefly described and the general arrangement of diagnostics for first plasma is illustrated.

22676 Mechanical design of an x-ray pulse-height analysis system for TFTR. Moshey, E.A.; Martinez, E. (Princeton Univ, NJ, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1118-1121(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The TFTR X-Ray Pulse-Height Analyzer (PHA) is used to measure the plasma soft x-ray emission in the 1-60 keV region. The time-dependent spatial profiles of the x-ray spectrum provide a measure of the electron temperature and high-Z impurity concentrations. The TFTR system will ultimately consist of 12 Pulse-Height Analyzers viewing vertically upward. The PHA System spans the TFTR Vacuum Vessel radially on five inch to eleven and one-half inch centers. This paper describes the mechanical aspects of a typical, single, PHA assembly which will be part of a 12 assembly system. The paper concentrates on the Day-1 PHA Systems.

22677 Mechanical design of an x-ray imaging system for TFTR. Moshey, E.A. (Princeton Univ, NJ, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1126-1129(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The X-Ray Systems (XIS) described herein will operate on TFTR during hydrogen (HH and DH) and Deuterium (DD) discharges only. This paper describes the mechanical aspects of the design of an XIS which serves as a multi-function instrument for determining how well plasma discharges are proceeding by monitoring profiles of x-ray emission in order to: (a) measure the major radius position of the plasma by viewing from above along 76 chords, (b) measure the vertical position of the plasma by viewing horizontally, (c) determine the power loss from radiation in the energy region 0.1 <E <50keV, and (d) reconstruct the MHD fluctuation emissivity profiles from one horizontal and two vertical view using the natural rotation at frequencies up to /similar/ 100kHz.

22678 Design, fabrication, and testing of the TFTR Rogowski coil and diamagnetic loop. McCormack, B.; Thomas, J.P. (Princeton Univ, NJ, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1130-1133(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The Rogowski Coil is one of the most basic and most important of the Tokamak diagnostics from a measurement and control aspect. The Diamagnetic Loop measures the change of toroidal flux caused by the presence of the plasma and the currents flowing in it; this leads to the measurement of the poloidal beta ratio. The final design resulted in stainless steel mandrels being used with the resultant diffculties of electrical insulation. The design details are presented, both mechanical and electrical, along with the details of the fabrication process.

22679 TFTR diagnostics grounding. Norris, M.E. (Princeton Univ, NJ, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1134-1137(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The TFTR (Tokamak Fusion Test Reactor) now under construction at Princeton Plasma Physics Laboratory (PPPL) is scheduled to begin tune-up in 1982 with neutral beam systems operational in 1983. TFTR diagnostic systems are distributed throughout the space surrounding the Tokamak (Test Cell), and under the Tokamak in the Test Cell Basement. Both diagnostics equipment and the cable runs are subject to electromagnetic interference (EMI) from the Tokamak, high power ancillary systems, and from diagnostic-to-diagnostic crosstalk.

22680 Kinetic study of sheath region near the first wall for tokamak fusion reactors. Schwager, L.A. *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 487-490(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

Theoretical profiles of density, temperature, drift velocity, and electric field are calculated for the sheath region between the plasma and first wall of a tokamak fusion reactor. It is shown that gyro-orbit effects on charged particle diffusion across the magnetic field create a sheath potential of 6 e/phi/sub k/T/sub e/ that strongly repels ions. This effect becomes important in the evaluation of sputtering and secondary electron emission at the first wall due to ion bombardment.

22681 Study of plasma edge conditions for a commercial tokamak reactor. Boley, C.D.; Brooks, J.N. (Argonne Natl Lab, IL, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 491-494(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

Particle and energy fluxes to the first wall and pumped limiter of a commercial-size tokamak power reactor have been studied with a one-dimensional, time-dependent plasma transport code. The plasma is operated in an enhanced radiation mode, with iodine as the high-Z impurity, whereby the transport power to the limiter is held to about half of the alpha-heating power. Recycling of neutral hydrogen and helium is followed in detail. The ion flux to the limiter and the neutral flux to the first wall are found to depend on the removal efficiency of the limiter/vacuum system. These fluxes also depend strongly on whether gas puffing or pellet injection is used for fueling.

22682 Proposed experimental study of fast ion driven electromagnetic instabilities at low thresholds. Sutton, W.R.; Choi, C.K.; Miley, G.H. (Univ of Ill, Urbana, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 511-514(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

Thermonuclear driven microinstabilities have potentially significant system level effects. experiments conducted to date, while confirming quasi-linear theory, have been performed at low densities, low temperatures and high threshold fractions. The feasibility of performing an experimental of the beam driven, fast magnetosonic mode at dramatically reduced threshold fraction (approximately 10/sup 1/5-10-/sup 4/) is demonstrated for an ISX-B plasma.

22683 Pole extraction from real-frequency information. Brittingham, J.N.; Miller, E.K.; Willows, J.L. (Lawrence Livermore Lab., CA). *Proceedings of the IEEE (Institute of Electrical and Electronics Engineers);* 68: No. 2, 263-273(Feb 19

This paper describes a procedure, analogous to Prony's method, for extracting the complex-frequency poles of electromagnetic transfer functions. The method is refined mathematically and is applied to both electrical and mechanical test cases. The paper explains a multiple processing technique, involving the overlaying of several pole sets, by which redundant data are used to separate actual from curve-fitting poles. Identification of an unknown target by comparing its scattered field with the poles sets of known targets is also illustrated for simple targets.

7002 Fusion Power Plant Technology

22684 (AD-A—118065/2) **One dimensional analysis of inertially confined plasmas. Master's thesis.** DeBruyne, D.A. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Mar 1982. 220p. NTIS, PC A10/MF A01.

Energy transfer processes in a thermonuclear plasma including Coulombic phenomena, bremsstrahlung, and Compton scatter are critically reviewed. These processes are incorporated in a three temperature, inertially confined fusion computer simulation which uses a one dimensional, spherical, Lagrangian hydrodynamics scheme. The computer code, still in the validation phase, uses separate subroutines to model hydrodynamics, thermonuclear burn, neutron heating, alpha particle heating, and energy transfer processes in CGS units.

22685 (AD-A—120052/6) **Perform experiments on LINUS-O and LTX imploding liquid liner fusion systems. Final report 8 Sep 80-30 Sep 81.** Scannell, E.P. (JAYCOR, Alexandria, VA (USA)). 27 Aug 1982. 26p. NTIS, PC A03/MF A01.

The Plasma Physics Division of the Naval Research Laboratory (NRL) has been conducting investigations of imploding liquid liner fusion systems for several years (Reference 1). This effort attained a significant milestone in 1978 with the construction of two machines: HELIUS and LINUS-O. LINUS-O is a 60 MJ rotor system where a cylindrical liquid sodium - potassium (NaK) metal liner is radially compressed from a 30 cm to 1 cm diameter by gas pressure from multiple high explosive charges. These charges act on an annular piston in contact with the liquid NaK liner material. HELIUS is a half-scale vertical axis version of LINUS-O using high pressure helium to drive the annular piston. HELIUS is designed to be a test bed for new concepts and to permit testing of new modifications to LINUS-O. The principal virtue of HELIUS is its capability for ten to twenty shots per day as compared to two or three shots per day for LINUS-O. In addition, HELIUS is designed to provide higher drive pressures than were previously obtainable with water models for liner hydrodynamic studies and a magnetic flux compression capability up to approx. 100 kG.

22686 (ANL/NESC—873) **COAST4; costing & sizing of tokamak reactors.** Sink, D.A.; Iwinski, E.M. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Fusion Power Systems Dept.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048873.

Devices which can be sized and costed include: TFTR (Tokamak Fusion Test Reactor), The Next Step (TNS) devices, fusion-fission hybrids, engineering demonstration reactors, and power producing reactors. Both the ignition mode and the neutral-beam-driven mode of plasma operation are modeled. The plasma engineering calculations involve zero-dimensional models which account for energy balance, particle balance, alpha-particle effects, slowing-down theory, plasma-plasma and beam-plasma fusion reaction rates, impurity effects, and profile effects. The tokamak engineering calculations account for poloidal and toroidal magnetic field coil assemblies (both superconducting and copper conductors are possible), neutral beam injectors, blanket/shield assemblies, plasma fueling, divertors, heat dissipation systems, and related power supplies. The reactor cell containing the tokamak device, the turbine-generator plant and facility, and balance-of-plant systems are taken into account. The amount of output produced is controlled by user-specified input. The output data may consist of simply a summary table of the main plasma, engineering, and cost data, or may be expanded to include a complete set of results characterizing the plasma during burn as well as start-up; the neutral beam system; the fusile fuel system loads; blanket/shield assembly sizing; divertor parameters; poloidal field coil geometry, electrical data, self and mutual inductances, and time profiles of currents, voltages, powers, and energy utilization; toroidal field coil assembly and power supply data; heat and electrical power generation data; device radial and vertical geometry tables; detailed electrical data; component costs; annual operating costs; and a summary of the Fusion Reactor Economic Evaluation.

22687 (ANL/NESC—875) **TSOAK-M1; analysis of fusion detritiation data.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Minkoff, M. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048875.

Maximum of - 500 experimental data points.

TSOAK-M1 analyzes the reaction/adsorption/release mechanisms taking place in a large enclosure following release of large quantities of tritium. It is designed to analyze experimental tritium cleanup data in terms of these mechanisms and to perform correlations with and extensions to actual building enclosures.IBM370,303x; FORTRAN IV; OS/370; 400K bytes of memory are required.

22688 (CONF-781247—10) **Development of high-energy heavy ions for inertial-confinement fusion: a phased approach.** Martin, R.L. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 13p. NTIS, PC A02/MF A01. Order Number DE83007777.

From 2. international conference on energy storage, compression and switching; Venice, Italy (5 Dec 1978).

High-energy heavy ions appear very promising as the ignition source for Inertial Confinement Fusion (ICF). As a first stage in developing the feasibility of heavy ions for this application, Argonne has designed a minimal facility capable of both demonstrating all of the accelerator techniques required in a power-plant-size facility and also of performing several physics experiments of interest to heavy-ion fusion. This design, called Phase I, would make optimal use of existing facilities made available by the termination of operation of the Zero Gradient Synchrotron (ZGS), a 12-GeV proton synchrotron for high-energy physics, in 1979. The Phase I facility would produce xenon beams of 6.4 GeV containing up to 10 kJ of beam energy at 4 TW suitable for focusing onto foils for energy-deposition experiments and studies of various beam-plasma instability experiments.

22689 (CONF-810831—100) **Materials selection for the US INTOR divertor collector plate.** Mattas, R.F.; Misra, B.; Smith, D.L.; Morgan, G.D.; Delaney, M.; Gold, R. (Argonne National Lab., IL (USA); McDonnell Douglas Astronautics Co., St. Louis, MO (USA); Westinghouse Electric Corp., Pittsburgh, PA (USA)). 1981. Contract W-31-109-ENG-38. 6p. NTIS, PC A02/MF A01. Order Number DE83007871.

From Fusion reactor materials meeting; Seattle, WA, USA (9 Aug 1981).

The divertor collector plate in the INTOR reactor will be subjected to high heat, particle, and neutron fluxes, making it the most severely damaged torus component. The collector plate is composed of a protection plate, which is directly exposed to the particle flux, and a heat sink which provides support for the protection plate and carries the water coolant. The high-Z refractory metals have been considered for use as the protection plate material, and austenitic stainless steels and copper alloys have been considered as the heat sink material. Tungsten and Type 316 stainless steels have been selected for the protection plate and heat sink, respectively. The protection plate has a sputtering lifetime of 1.75 y at a 50% duty factor, while the heat sink is expected to last the lifetime of the reactor.

22690 **(CONF-810831—101) Neutron-source characterization for fusion-materials studies.** Greenwood, L.R. (Argonne National Lab., IL (USA)). Jun 1981. Contract W-31-109-ENG-38. 6p. NTIS, PC A02/MF A01. Order Number DE83007829.

From Fusion reactor materials meeting; Seattle, WA, USA (9 Aug 1981).

Neutron-flux and energy-spectrum measurements are conducted for all major fusion-materials irradiation facilities, including fission reactors and accelerators. Dosimetry-characterization experiments and integral cross section measurements have been performed. Multiple activation and helium-production measurements are performed routinely to provide materials experimenters with neutron-exposure parameters including fluence, spectrum, displacements, gas production, and transmutation with typical accuracies of 10 to 15%. Such data are crucial to the fusion-materials program in order to correlate materials-property changes between irradiations and facilities and to confidently predict the performance of materials in fusion reactors.

22691 **(CONF-811040—190) Redeposition of the sputtered surface in limiters.** Brooks, J.N.; McGrath, R.T. (Argonne National Lab., IL (USA); Pennsylvania State Univ., University Park (USA)). 1981. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01. Order Number DE83007756.

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

Erosion of the surface coating of a pumped limiter by sputtering may be a critical life-limiting issue for future tokamak reactors. Redeposition of the sputtered material, however, may extend the coating life significantly. This subject has now been studied through the use of a code which models the redeposition of sputtered material which gets ionized in the scrape-off layer. The code also treats the transfer of wall-sputtered material to the limiter. The code uses models of the plasma density and temperature in the scrape-off zone, sheath potential, sputtering coefficients, spatial distribution of the sputtered atoms, and electron impact ionization coefficient for the sputtered atoms. The studies were made for high flux and low flux edge conditions corresponding to FED and STARFIRE limiters and assumed plasma-edge parameters. The results indicate that substantial redeposition from the scrape-off layer ionized neutrals occurs in the cases considered.

22692 **(CONF-811040—191) INTOR radiation shielding for personnel access.** Gohar, Y.; Abdou, M. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 5p. NTIS (US Sales Only). Order Number DE83007698.

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The INTOR reactor shield system consists of the blanket, bulk shield, penetration shield, component shield, and biological shield. The bulk shield consists of two parts: (a) the inboard shield; and (b) the outboard shield. The distinction between the different components of the shield system is essential to satisfy the different design constraints and achieve various objectives.

22693 **(CONF-811040—193) Self-sustaining erosion-resistant low-Z coatings for first wall and limiter applications. I. Theory.** Krauss, A.R.; Gruen, D.M.; DeWald, A.B. (Argonne National Lab., IL (USA); Georgia Inst. of Tech., Atlanta (USA)). 1981. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01. Order Number DE83007701.

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

It has been suggested that dilute alkali-metal alloys at surface facing a Tokamak plasma might be used to provide a self-sustaining low-Z alkali-metal surface which would shield the structural component of the alloy from erosion. At the same time, the alkali-metal overlayer could be expected to primarily sputter as secondary ions, which are returned to the wall and limiter without entering the plasma. In order to achieve this goal, a number of conditions which may be mutually exclusive must be met. Several of these conditions are analyzed, providing information on the feasibility and expected limits of performance for dilute alloys of Li in Al, Si, and Cu.

22694 **(CONF-811040—195) Physical sputtering code for fusion applications.** Smith, D.L.; Brooks, J.N.; Post, D.E. (Argonne National Lab., IL (USA); Princeton Univ., NJ (USA). Plasma Physics Lab.). Oct 1981. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01. Order Number DE83007700.

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

A computer code, DSPUT, has been developed to compute the physical sputtering yields for various plasma particles incident on candidate fusion-reactor first-wall materials. The code, which incorporates the energy and angular-dependence of the sputtering yield, treats both high- and low-Z incident particles bombarding high- and low-Z wall materials. The physical sputtering yield is expressed in terms of the atomic and mass numbers of the incident and target atoms, the surface binding energy of the wall materials, and the incident angle and energy of the particle. An auxiliary code has been written to provide sputtering yields for a Maxwellian-averaged incident particle flux. The code DSPUT has been used as part of a Monte Carlo code for analyzing plasma-wall interactions.

22695 **(CONF-811040—196) Can wall and limiter erosion be eliminated in fusion reactors.** Norem, J.H. (Argonne National Lab., IL (USA)). Oct 1981. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01. Order Number DE83007695.

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

A pump limiter system is described which is compatible with in-situ recoating of the limiter surface. The recoating could be done during normal tokamak operation. We have shown how this system is compatible with most of the constraints of fusion reactor operation and might provide a significant advantage over magnetic diverter and some other pump limiter geometries.

22696 **(CONF-811040—197) Initial progress in the first wall, blanket, and shield Engineering Test Program for magnetically confined fusion-power reactors.** Herman, H.; Baker, C.C.; Maroni, V.A. (Argonne National Lab., IL (USA)). Oct 1981. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01. Order Number DE83007790.

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The first wall/blanket/shield (FW/B/S) Engineering Test Program (ETP) progressed from the planning stage into implementation during July, 1981. The program, generic in nature, comprises four Test Program Elements (TPE's), the emphasis of which is on defining the performance parameters for the Fusion Engineering Device (FED) and the major fusion device to follow FED. These elements are: (1) nonnuclear thermal-hydraulic and thermomechanical testing of first wall and component facsimiles with emphasis on surface heat loads and heat transient (i.e., plasma disruption) effects; (2) nonnuclear and nuclear testing of FW/B/S components and assemblies with emphasis on bulk (nuclear) heating effects, integrated FW/B/S hydraulics and mechanics, blanket coolant system transients, and nuclear benchmarks; (3) FW/B/S electromagnetic and eddy current effects testing, including pulsed field penetration, torque and force restraint, electromagnetic materials, liquid metal MHD effects and the like; and (4) FW/B/S Assembly, Maintenance & Repair (AMR) studies focusing on generic AMR criteria, with the objective of preparing an AMR designers guidebook; also, development of rapid remote assembly/disassembly joint system technology, leak detection and remote handling methods.

22697 **(CONF-811046—19) First-wall and blanket engineering development for magnetic-fusion reactors.** Baker, C.; Herman, H.; Maroni, V.; Turner, L.; Clemmer, R.; Finn, P.; Johnson, C.; Abdou, M. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 28p. NTIS, PC A03/MF A01. Order Number DE83007643.

From Meeting and workshop on fusion reactor design and technology; Tokyo, Japan (5 Oct 1981).

A number of programs in the USA concerned with materials and engineering development of the first wall and breeder blanket systems for magnetic-fusion power reactors are described. Argonne National Laboratory has the lead or coordinating role, with many major elements of the research and engineering tests carried out by a number of organizations including industry and other national laboratories.

22698 (CONF-811274—1) **Charge, quantum state, and energy distributions of impurities released in plasma-wall interaction processes.** Gruen, D.M. (Argonne National Lab., IL (USA)). 1981. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01. Order Number DE83007758.

From Institute of Plasma Physics conference; Nogoya, Japan (14 Dec 1981).

Conventional wisdom has it that total sputtering yields correlate with high Z-impurity levels found in fusion plasmas. The charge, quantum states and energy distributions of sputtered atoms have been virtually ignored in these considerations. Impurity transport from the wall or limiter to the plasma is, however, strongly influenced by these factors which may play a crucial role in determining impurity levels in the deeper plasma regions. Preliminary calculations have shown that positively charged impurities would most likely be redeposited on their surfaces of origin. The conditions leading to charged or excited state atoms emission and the energy distributions of such species are reviewed. Techniques for measuring these quantities are discussed and the need for a wider data base in this field is pointed out.

22699 (CONF-820545—22) **Oxygen and titanium sputtering yields as determined by laser fluorescence and Auger electron spectroscopy for monolayer oxygen coverage of polycrystalline Ti.** Pellin, M.J.; Young, C.E.; Mendelsohn, M.H.; Gruen, D.M.; Wright, R.B.; DeWald, A.B. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 22p. NTIS, PC A02/MF A01. Order Number DE83007683.

From 5. international conference on plasma surface; Gatlinburg, TN, USA (3 May 1982).

The presence of an oxide layer can strongly influence the charge-state of species ejected from ion-bombarded metal surfaces, as well as the total sputtering yield. These quantities directly affect the influx of metallic impurities from the wall region into the plasmas of fusion devices. Surface coverage can also modify the distribution of sputtered atoms among electronic states and thus the apparent impurity density detected by the laser fluorescence spectroscopy (LFS) technique. The measurements reported here provide LFS data on number density and electronic state populations for the species Ti and Ti^+ as a function of surface oxygen coverage in a laboratory apparatus providing for direct monitoring by Auger analysis.

22700 (CONF-820838—3) **Review of commercial tokamak fusion-reactor conceptual design studies.** Baker, C.C.; Conn, R.W. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 42p. NTIS, PC A03/MF A01. Order Number DE83007569.

From Future engineering development needs for magnetic fusion workshop; Washington, DC, USA (3 Aug 1982).

A summary of the design developments for tokamaks is given. In general, these design developments have emphasized less complex, more reliable components and systems. Several of these developments are applicable to other reactor concepts (e.g., nondivertor impurity control, rf heating, maintenance concepts, and simplified energy conversion systems. Some of these ideas are reasonably well supported by current experiments and theory (e.g., projected size of tokamaks for ignition) while some of the other concepts (e.g., non-divertor impurity control, steady-state operation, solid tritium breeders) require much more research and development.

22701 (CONF-821108—25) **Safety and stability of superconducting magnets for fusion using internally cooled conductors.** Turner, L.R.; Ryne, R.D. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01. Order Number DE83007728.

From Applied superconductivity conference; Knoxville, TN, USA (30 Nov 1982).

Vincent Arp's computer code for the stability analysis of internally cooled conductors (ICC) has been combined with ANL's TASS code to create the code SSICC for the analysis of the safety and stability of ICC. The code has been tested against the ICC experiments of Lue, Miller, and Dresner, and applied to the FED TF coil conductor.

22702 (CONF-830406—3) **Tritium-assisted deuterium-based fusion breeders.** Greenspan, E.; Miley, G.H. (Illinois Univ., Urbana (USA). Fusion Studies Lab.). 1983. Contract AC02-76ET52040. 2p. (COO—2218-268). NTIS, PC A02/MF A01. Order Number DE83005315.

From 5. topical meeting on technology of fusion energy; Knoxville, TN, USA (26 Apr 1983).

This study investigates the economic prospects of T-assisted D-based Fusion Breeders (FB's) in comparison with a conventional D-T FB.The D-based driver uses the Tritium-Catalyzed-Deuterium (TCD) mode of operation where the ^3He leaking out from the plasma is converted into T in the blanket (by neutron capture). The T produced is then added back to the plasma. TCD operation is selected because it offers a significantly higher neutron yield and support-ratio than the standard Catalyzed-D. It offers also higher neutron yield and better plasma energy balance than the standard Semi-Catalyzed-D mode.

22703 (DOE/DP/40166—1) **Wavelength scaling of the two-plasmon decay and stimulated Raman-scattering instabilities. Annual progress report, September 10, 1981-September 9, 1982.** Chen, F.F.; Joshi, C.; Ebrahim, N.A. (California Univ., Los Angeles (USA). Dept. of Electrical Engineering; Yale Univ., New Haven, CT (USA). Dept. of Applied Mechanics). Mar 1983. Contract AS08-81DP40166. 24p. NTIS, PC A02/MF A01. Order Number DE83007905.

This report contains description of the joint work done by the UCLA-Yale Users' Group at NLUF, LLE Rochester on the two plasmon decay and stimulated Raman scattering instabilities at 0.35 μm laser wavelength. A brief summary of the theoretical work on how SBS influences SRS is also given.

22704 (DOE/ER—0045/9) **Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.** (Oak Ridge National Lab., TN (USA)). Feb 1983. Contract W-7405-ENG-26. 345p. NTIS, PC A15/MF A01. Order Number DE83006357.

Separate abstracts were prepared for 19 of the included sections. (MOW)

22705 (DOE/ER—0045/9, pp 6-16) **Neutron source characterization for materials experiments.** Greenwood, L.R. (Argonne National Lab., IL). Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

Measurements and calculations are presented for the ORR-MFE4A spectral-tailoring experiment after an irradiation of 406 full power days (30 MW) between June 12, 1980 and April 26, 1982. The maximum fluence inside the capsule was 1.76 x 10^{22} n/cm^2 producing 4.67 DPA and 63 appm He in stainless steel (13%) Ni). Values outside the sample holders were 1.88 x 10^{22} n/cm^2, 4.94 DPA and 73 appm He in stainless steel. Helium calculations include epithermal effects and the extra displacements from the energetic ^{56}Fe recoils.

22706 (DOE/ER—0045/9, pp 21-31) **HFIR/FFTF irradiation experiment: final design phase.** Ermi, A.M.; Greenslade, D.L.; Vitek, J.M. Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

The combined HFIR/FFTF experiment on the Path A Prime Candidate Alloy and the Path D Long-Range Ordered Alloys is in the final design stage. A sodium-filled test assembly to be used for the HFIR irradiation has been designed, the main features of which are described. The updated proposed test matrix is also presented.

22707 (DOE/ER—0045/9, pp 38-43) **Irradiation creep in path A alloys irradiated to 5 dpa in the ORR-MFE-4A spectral tailoring experiment.** Grossbeck, M.L. (Oak Ridge National Lab., TN). Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

Pressurized tubes have been irradiated to 4.8 dpa at 330 and 400°C in the ORR-MFE-4A spectral tailoring experiment. At 330°C, 20%-cold-worked type 316 stainless steel (CW 316) and path A PCA demonstrated irradiation creep similar to predictions of the irradiation creep equation developed in the Fast Breeder Reactor Program. The creep rate for path A PCA was approximately 25% higher than that of type 316 stainless steel.

22708 (DOE/ER—0045/9, pp 44-62) **Swelling and microstructural development in path A PCA and type 316 stainless steel irradiated in HFIR to about 22 dpa.** Maziasz, P.J.; Braski, D.N. (Oak Ridge National Lab., TN). Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

Irradiation of several microstructural variants of PCA and 20%-cold-worked N-lot type 316 stainess steel (CW 316) in HFIR to about 10 dpa produced no visible cavities at 300°C, bubbles at 400°C, and varying distributions of bubbles and voids at 500 and 600°C. The PCA-B1 swells the most and CW 316 (N-lot) the least at 600°C. Irradiations have been extended to about 22 dpa. The PCA-Al swells 0.06%/dpa at 600°C but at a much lower rate at 500°C. The PCA-A3 shows the lowest swelling at 600°C, about the half the swelling rate of type 316 stainless steel.

22709 (DOE/ER—0045/9, pp 63-70) **Tensile properties of unirradiated path A PCA.** Braski, D.N.; Maziasz, P.J. (Oak Ridge National Lab., TN). Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

The tensile properties of PCA in the Al (solution annealed), A3 (25%-cold worked), and B2 (aged, cold worked, and reaged) conditions were determined from room temperature to 600°C. The tensile behavior of PCA-A1 and -A3 was generally similar to that of titanium-modified type 316 stainless steel with similar microstructures. The PCA-B2 was weaker than PCA-A3, especially above 500°C, but demonstrated slightly better ducility.

22710 (DOE/ER—0045/9, pp 71-77) **Tensile properties and swelling of 20%-cold-worked type 316 stainless steel irradiated in HFIR.** Klueh, R.L.; Grossbeck, M.L. (Oak Ridge National Lab., TN). Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

Immersion density and elevated-temperature tensile properties were determined on 20%-cold-worked type 316 stainless steel irradiated in the HFIR to fluences of 3.5 to 6.3 x 10^{26} neutrons/m^2 (>0.1 MeV), which resulted in 25 to 49 dpa and 1650 to 3100 at. ppM He. These data were combined with the data previously obtained after irradiation to lower fluences (<4.0 x 10^{26} neutrons/m^2).

22711 (DOE/ER—0045/9, pp 78-88) **Microstructural development of 20%-cold-worked type 316 stainless steel irradiated in ORR at 250 to 500°C.** Maziasz, P.J. (Oak Ridge National Lab., TN). Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

No voids, bubbles, or precipitation are observed in 20%-cold-worked (ref.-heat) type 316 stainless steel irradiated in ORR at 250 to 500°C to produce 5 dpa and 38.7 at. ppM He. There is some recovery of the cold-worked structure at 500°C, but not at 250 to 450°C. The total dislocation structure is quite dense from 250 to 450°C due to the presence of many Frank loops and a high concentration of fine loops (black dots). No significant effect of helium could be determined, but bubble formation appears retarded in ORR compared with that in HFIR.

22712 (DOE/ER—0045/9, pp 90-120) **Ductility behavior of irradiated path B alloys.** Yang, W.J.S.; Hamilton, M.L. (Westinghouse Hanford Co., Richland, WA). Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

The objective of this study was to assess the practicality of using five Path B alloys in their current form as structural materials in the Fusion First-Wall/Blanket by evaluating both their postirradiation ductility and the corresponding microstructures.

22713 (DOE/ER—0045/9, pp 122-142) **Mechanical property evaluations of path C vanadium scoping alloys.** Gold, R.E.; Bajaj, R. Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

Creep/stress-rupture tests were performed on sheet specimens of the three Path C vanadium Scoping Alloys in the temperature range 650 to 800°C. These specimens had been intentionally contaminated with nominal additions of 600 and 1200 wppm oxygen by controlled gas-metal reactions. The effects of oxygen additions on the creep behavior of the vanadium alloys, over the limited range of stress-temperature conditions examined, did not appear to be significant. Creep strengths and ductilities appeared to be affected very little compared to tests at similar conditions on noncontaminated specimens of the vanadium alloys. These results are different in that regard from similar comparisons of tensile properties of contaminated and noncontaminated vanadium alloy specimens where a partial change in the fracture behavior was observed for the oxygen-contaminated specimens.

22714 (DOE/ER—0045/9, pp 144-157) **Microstructure of welds in an iron-base long-range-ordered alloy.** Braski, D.N.; David, S.A. (Oak Ridge National Lab., TN). Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

The microstructure of gas tungsten arc (GTA) welds of a $(Ni,Fe)_3(V,Ti)$ LRO alloy has been investigated. Crack-free welds were produced in which the heat-affected zone (HAZ) and fusion zone were disordered and softened. A postweld heat treatment increased the hardness of both zones by reordering the structure and produced additional hardening in the fusion zone due to precipitation of small VC particles on grain boundaries and matrix dislocations.

22715 (DOE/ER—0045/9, pp 178-219) **Fractographic examination of HT-9 and 9Cr-1Mo Charpy specimens irradiated in the AD-2 test.** Gelles, D.S.; Hu, W.L. (Westinghouse Hanford Co., Richland, WA). Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

Fracture surface topologies have been examined using scanning electron microscopy for 20 selected half sized Charpy impact specimens of HT-9 and Modified 9Cr-1Mo in order to provide improved understanding of fracture toughness degradation as a result of irradiation for Path E alloys. The specimen matrix included unirradiated specimens and specimens irradiated in EBR-II in the AD-2 experiment. Also, hardness measurements have been made on selected irradiated Charpy specimens. The results of examinations indicate that irradiation hardening due to G-phase formation at 390°C is responsible for the large shift in ductile-to-brittle transition temperature (DBTT) found in HT-9. Toughness degradation in HT-9 observed following higher temperature irradiations is attributed to precipitation at delta ferrite stringers. Reductions in toughness as a consequence of irradiation in Modified 9Cr-1Mo are attributed to in-reactor precipitation of (V,Nb)C and $M_{23}C_6$. It is shown that crack propagation rates for ductile and brittle failure modes can be measured, that they differ by over an order of magnitude and that unexpected multiple shifts in fracture mode from ductile to brittle failure can be attributed to the effect of delta ferrite stringers on crack propagation rates.

22716 (DOE/ER—0045/9, pp 221-229) **Fracture toughness of unirradiated HT-9 and modified 9Cr-1Mo welds.** Huang, F.H. (Westinghouse Hanford Co., Richland, WA). Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

The fracture toughness of HT-9 weld metal, HT-9 HAZ and modified 9Cr-1Mo weld metal was measured using electropotential techniques. Circular (2.54 mm thick) compact tension specimens were fabricated from welded materials with the notch orientation parallel to the fusion line. Tests were performed at 93, 205, 427 and 538°C. The test results were analyzing using the J-integral approach. It was found that the fracture toughness of HT-9 and modified 9Cr-1Mo was not significantly reduced due to welding.

22717 (DOE/ER—0045/9, pp 231-243) **Effect of melt practice (ESR vs. AOD) on the toughness of HT-9 laser welds.** Lippold, J.C. (Sandia National Labs., Livermore, CA). Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

The toughness behavior of laser welded AOD- and ESR-processed material from the National Fusion Heat was evaluated. In general, the fusion zone toughness was equivalent, if not superior, to that of the base metal. The microstructural refinement which results from weld solidification is probably responsible for the improvement in properties. The chemical inhomogeneity due to paritioning during solidification is probably responsible for the improvement in properties. The chemical inhomogeneity due to partitioning during solidification appears to exert only a small effect on the properties. The fracture mode is analogous to that of the base material; lower shelf failure exhibits a cleavage mode while upper shelf failure occurs by ductile rupture.

22718 (DOE/ER—0045/9, pp 244-251) **Effect of quench rate and refrigeration on the mechanical properties of ESR processed HT-9.** Garrison, W.M. Jr.; Hyzak, J.M. (Sandia National Labs., Livermore, CA). Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

HT-9 contains about 9 volume percent retained austenite when air cooled after austenitizing. To reduce the retained austenite content of HT-9 from that of the air cooled (AC) condition, two other treatments after austenitizing were employed: oil quenching (OQ) and oil quenching followed by refrigeration in liquid nitrogen (OQLN). The OQ structure contained 6% retained austenite and the OQLN structure had only 4% retained austenite. Preliminary Charpy impact data indicate some beneficial effect of these treatments. The Charpy impact values of specimens tempered at 750°C were 78, 80 and 97 ft-lbs for the AC, OQ and OQLN structures respectively.

22719 (DOE/ER—0045/9, pp 255-272) **Miniature Charpy impact test results for irradiated ferritic alloys.** Hu, W.L. (Westinghouse Hanford Co., Richland, WA). Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

Impact tests of irradiatd Charpy specimens made of ferritic alloys were conducted at temperatures from -65° to 250°C. The specimens involve four different material stocks, namely, HT-9 base metal, HT-9 weld metal, HT-9 heat-affected-zone (HAZ) and modified 9Cr-1Mo base metal. The specimens were irradiated in EBR-II to a peak exposure of approximately 13 dpa at temperatures of 390, 450, 500 and 550°C. Specimens made of unirradiated HT-9 base metal and modified 9Cr-1Mo base metal were also tested.

22720 (DOE/ER—0045/9, pp 290-303) **Corrosion of path A PCA, type 316 stainless steel and Fe-12 Cr-1 MoVW steel in flowing lithium.** Tortorelli, P.F.; DeVan, J.H. (Oak Ridge National Lab., TN). Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

Results from lithium thermal-convection loop (TCL) experiments with the path A prime candidate alloy (PCA), type 316 stainless steel, and Fe-12 Cr-1 MoVW are presented. The short-term (< 3050 h) weight losses of PCA in flowing lithium were just slightly higher than those of type 316 stainless steel and may be attributable to the higher nickel concentration of PCA. The corrosion response of PCA specimens was not affected by cold work. A surface analysis of type 316 stainless steel specimens exposed in the hot leg of a TCL for over 7000 h confirmed earlier observations regarding preferential leaching of nickel and chromium and deposition of pure chromium. These analyses also showed that exposure temperature strongly affects surface porosity and that molybdenum enrichment occurs on surfaces undergoing dissolution. Weight loss data as a function of time for Fe-12 Cr-1 MoVW steel exposed to lithium at 500°C yielded the same dissolution rate as the steady-state value for nickel-depleted type 316 stainless steel. Significant weight losses were measured in the cold leg of this loop, and they appeared to be related to chromium depletion (possibly as a result of impurity reactions).

22721 (DOE/ER—0045/9, pp 304-313) **Environmental effects on properties of structural alloys.** Chopra, O.K.; Smith, D.L. Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

Compatibility tests were conducted with several ferritic and austenitic steels at 700 and 755 K to study the corrosion behavior in flowing lithium, and fatigue tests were performed with Type 316 stainless steel in lithium at 755 K. The results indicate that an increase in the nitrogen content in lithium increases the dissolution rate, whereas the depth of internal penetration is not affected significantly. The dissolution rate of ferritic steels is an order of magnitude lower than for the austenitic stainless steel. The austenitic steels develop a very porous ferrite layer, whereas the ferritic steels exhibit little or no penetration. For the austenitic stainless steels, depth of internal penetration increases with time and the penetration rates at 755 K range from 50 to 180 μm/year. Preliminary data on Type 316 stainless steel yield similar penetration rates at 700 and 755 K. The fatigue life of annealed Type 316 stainless steel in lithium at 755 K is a factor of 3 to 8 greater than in air.

22722 (DOE/ER—0045/9, pp 314-322) **Corrosion of ferrous alloys in static Pb and Pb-17 at. % Li.** Tortorelli, P.F.; DeVan, J.H. (Oak Ridge National Lab., TN). Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

Specimens of type 316 stainless steel were exposed to static pure lead for 1000 and 3000 h at 400, 500, and 600°C, respectively. Weight losses measured in these tests were compared with those measured in similar tests with Pb-17 at. % Li. The data showed that the addition of 17 at. % Li to lead has some effect on its dissolution behavior relative to type 316 stainless steel; however, the weight losses in both the lead-lithium and pure lead melts were much larger than in pure lithium. Preliminary results from compositional analyses of type 316 stainless steel exposed to static Pb-17 at. % Li showed surface depletion of nickel at 500°C.

22723 (DOE/ER—0045/9, pp 323-338) **Compatibility studies of structural alloys with solid breeder materials.** Chopra, O.K.; Smith, D.L. (Argonne National Lab., IL). Feb 1983. NTIS, PC A15/MF A01.

In Alloy development for irradiation performance. Semiannual progress report for period ending September 30, 1982.

The compatibility of ferritic and austenitic steels with Li_2O pellets has been investigated at 823 K (550°C) in flowing helium containing 93 ppM H_2O and 1 ppM H_2. The results indicate that both steels develop an iron-rich outer scale and a chromium-rich subscale. The reaction rates for ferritic and austenitic steels are comparable and yield a value of ~ 85 μm/year for penetration rate. The Li_2O pellets exposed with the various alloys lose weight. The weight loss follows a parabolic law, predicting a value of ~ 4.8%/year.

22724 **(DOE/ET/52040—T7) Effects of nuclear elastic scattering and modifications of ion-electron equilibration power on advanced-fuel burns.** Galambos, J.D. (Illinois Univ., Urbana (USA). Dept. of Nuclear Engineering). 1983. Contract AC02-76ET52040. 126p. (COO—2218-258). NTIS, PC A07/MF A01. Order Number DE83007190.

The effects of Nuclear Elastic Scattering (NES) of fusion products and modifications of the ion-electron equilibration power on D-T and D-based advanced-fuel fusion plasmas are presented. The processes causing the modifications to the equilibration power included here are: (1) depletion of low-energy electrons by Coulomb collisions with the ions, and (2) magnetic field effects on the energy transfer between the ions and the electrons. A Hot Ion Mode (HIM) analysis was used to investigate the changes in the minimum ignition requirements for Cat-D and D-^{3}He plasmas, due to the changes in the allowable T/sub i//T/sub e/ for ignition from NES and equilibration modifications. Both of these effects have the strongest influence on the ignition requirements for high temperature (>50 keV), low beta (<15%) plasmas, where the cyclotron radiation power loss from the electrons (which is particularly sensitive to changes in the electron temperature) is large.

22725 **(EGG-FT—6138) Ohmically heated toroidal experiment (OHTE) mobile ignition test reactor facility concept study.** Masson, L.S.; Watts, K.D.; Piscitella, R.R.; Sekot, J.P.; Drexler, R.L. (EG and G Idaho, Inc., Idaho Falls (USA)). Feb 1983. Contract AC07-76ID01570. 49p. NTIS, PC A02/MF A01. Order Number DE83008006.

This report presents the results of a study to evaluate the use of an existing nuclear test complex at the Idaho National Engineering Laboratory (INEL) for the assembly, testing, and remote maintenance of the ohmically heated toroidal experiment (OHTE) compact reactor. The portable reactor concept is described and its application to OHTE testing and maintenance requirements is developed. Pertinent INEL facilities are described and several test system configurations that apply to these facilities are developed and evaluated.

22726 **(GA-A—16818) Data-acquisition systems for the present and the future.** Drobnis, D.D. (GA Technologies, Inc., San Diego, CA (USA)). Sep 1982. Contract AT03-76ET51011. 50p. (CONF-820944—7). NTIS, PC A03/MF A01. Order Number DE83007186.

From Workshop on diagnostics for fusion reactor conditions; Varenna, Italy (6 Sep 1982).

Basic components of today's acquisition systems are surveyed. These include front-end tools such as microprocessors, programmable controllers, and CAMAC interfaces. Some key concepts in large central real-time systems are examined: Hardware and Software architecture, and data base structure. Some trends in present data acquisition system design are analyzed, including increasing distribution of system functions and expansion to hierarchical multiprocessor netowrks. With the evolution of microprocessors, front-end intelligence is growing into front-end computing power. Real-time host systems are becoming increasingly sophisticated human interface and data base management tools, with increasingly complex operating systems, and increasing amounts of memory, mass storage, and computing power. And the ultimate analysis of plasma data is becoming increasingly sophisticated.

22727 **(HEDL-TME—82-9) Review of active neutron-spectrometry methods for the energy range of 1 to 50 MeV.** Fuller, J.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1983. Contract AC06-76FF02170. 84p. NTIS, PC A05/MF A01. Order Number DE83008078.

In support of the Fusion Materials Irradiation Test (FMIT) Facility, active neutron spectrometry methods for the energy range 1 to 50 MeV are reviewed from reports in the literature. The general operating characteristics of each type of spectrometer are summarized and conclusions drawn concerning applicability to the FMIT. The most useful system are: (1) liquid organic scintillators and (2) short path time-of-flight (TOF) telescopes. A magnetic spectrometer systems also is worthy of consideration.

22728 (INIS-SU—110, pp B-4) **Exact analytical force-free three-dimensional toroidal equilibria of arbitrary cross section.** Ferdinand, F.C. (Innsbruck Univ. (Austria)). 1981. NTIS (US Sales Only).

22736 **(IPP—2/259) Vacuum magnetic field and modular coil system of the advanced stellarator Wendelstein VII-AS.** Rau, F.; Kisslinger, J.; Wobig, H. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). Jun 1982. 44p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE83750190.

The vacuum field and the modular coils of the advanced stellarator WENDELSTEIN VII-AS are described. Each of the five field periods contains 9 different twisted coils, one of them with increased dimensions and current in order to provide sufficient access. The standard vacuum field configuration (B=3 T, t=0.39, aspect ratio approx. equal to 10, low shear, and magnetic well) can be varied by toroidal and vertical fields, or by changing independently the current in the large special coils. From a study of magnetic field perturbations some estimates are derived for the admissible coil tolerances.

22737 **(IPPJ—551) Workshop on first wall coating.** Kamada, K.; Fukutomi, M. (Nagoya Univ. (Japan)). Mar 1982. 230p. NTIS, PC A11/MF A01.

REFS Workshop held at Nagoya, Japan, 28-29 Nov. 1980.

Impurity control and first wall design in the JT 60 long pulse Tokamak is discussed. The present state of coating technology in Japan is reviewed with emphasis on fabrication methods and the characterization of thin coated films available by plasma spraying and chemical and physical vapor deposition. Surface preparation, radiation damage, internal stress, crystal structure and bonding are considered as well as the application of silicon carbide, titanium nitride, titanium carbide, titanium boride, and chromium nitride coatings by magnetron sputtering, long plating, electron beam evaporation, and gas absorption and reactive r.f. sputtering.

22738 (LA—9629-PR) **Transport and reactor theory. Progress report, July 1-September 30, 1982.** O'Dell, R.D.; Alcouffe, R.E. (Los Alamos National Lab., NM (USA)). Jan 1983. Contract W-7405-ENG-36. 28p. NTIS, PC A03/MF A01. Order Number DE83008276.

Research and development progress in transport and reactor theory by the Los Alamos National Laboratory's Group T-1 for the fourth quarter of FY 82 is reported. Included are tasks in the areas of Fission Reactor Neutronics, Transport Methods Supporting Research, Reactor Safety Analysis, Fusion Reactor Nucleonics, and Special Projects.

22739 (LBL—15066-Summ.) **Efficient, radiation-hardened, 800-keV neutral beam injection system.** Anderson, O.A.; Cooper, W.S.; Goldberg, D.A.; Ruby, L.; Soroka, L.; Fink, J.H. (Lawrence Berkeley Lab., CA (USA); Lawrence Livermore National Lab., CA (USA)). Oct 1982. Contract AC03-76SF00098. 3p. (CONF-830406—1-Summ.). NTIS, PC A02/MF A01. Order Number DE83002557.

From 5. topical meeting on technology of fusion energy; Knoxville, TN, USA (26 Apr 1983).

Recent advances and new concepts in negative ion generation, transport, acceleration, and neutrailzation make it appear likely that an efficient, radiation-hardened neutral beam injection system could be developed in time for the proposed FED-A tokamak. These new developments include the operation of steady-state H^- ion sources at over 5 A per meter of source length, the concept of using strong-focussing electrostatic structures for low-gradient dc acceleration of high-current sheet beams of negative ions and the transport of these beams around corners, and the development of powerful oxygen-iodine chemical lasers which will make possible the efficient conversion of the negative ions to neutrals using a photodetachment scheme in which the ion beam passes through the laser cavity.

22740 (LBL—15483) **Neutral-particle-beam production and injection.** Post, D.; Pyle, R. (Lawrence Berkeley Lab., CA (USA); Princeton Univ., NJ (USA). Plasma Physics Lab.). Jul 1982. Contract AC03-76SF00098. 43p. (CONF-820731—2). NTIS, PC A03/MF A01. Order Number DE83006966.

From North Atlantic Treaty Organization Advanced Study Institute conference on atomic and molecular processes in controlled thermonuclear research; Palermo, Italy (19 Jul 1982).

This paper is divided into two sections: the first is a discussion of the interactions of neutral beams with confined plasmas, the second is concerned with the production and diagnosis of the neutral beams. In general we are dealing with atoms, molecules, and ions of the isotopes of hydrogen, but some heavier elements (for example, oxygen) will be mentioned. The emphasis will be on single-particle collisions; selected atomic processes on surfaces will be included.

22741 (NRL-MR—5003) **New measurement techniques using tracers within laser-produced plasmas.** Herbst, M.J.; Burkhalter, P.G.; Duston, D. (Naval Research Lab., Washington, DC (USA)). 6 Jan 1983. Contract AI08-79DP40092. 35p. (CONF-821089—7). NTIS, PC A03/MF A01. Order Number DE83007231.

From 6. international workshop on laser interaction and related plasma phenomena; Monterey, CA, USA (25 Oct 1982).

The use of locally embedded tracers within laser-irradiated solid targets has led to a new class of diagnostic methods for laser-produced plasmas. Demonstrated uses of tracers include the first visualizations of hydrodynamic flow of laser-ablated material and improved spectroscopic measurements of plasma density and temperature profiles; comparisons with a two-dimensional hydrodynamics computer code are shown. Proposed future uses of tracers include the first measurements of fluid velocity profiles and improved determinations of mass ablation rates.

22742 (REPT—81-139) **The belt-shaped screw-pinch reactor.** Bustreaan, M.; Brandt, B.; Damstra, G.C.; Hoekzema, J.A.; Klippel, H.T.; Lievense, K. (FOM-Instituut voor Plasmafysica, Rijnhuizen (Netherlands)). Dec 1981. 70p. NTIS, PC A04/MF A01.

REFS Sponsored by Euratom and Nederlandse Organisatie voor Zuiver-Wetenschappelijk Onderzoek (ZWO).

Economic and technical aspects of a BSPRIL are considered. Force-free currents in a low density outer plasma envelope enable beta to rise to values on the order of 50%. Reactor operation consists of the formation, heating and ignition of a very small amount of the fuel to be burnt in one pulse by the fields generated by normal or superconducting coils. Then follows injection of the greater part of the fuel by DT pellets and consequent plasma heating and expansion by nuclear reactions without undue disturbing of the plasma current configuration. Technical requirements include an insulating first wall and fast rising magnetic fields produced by superconducting coils. A BSPRIL with pulsed superconducting coils is an economically attractive alternative to other toroidal pinch reactors and Tokamaks.. A BSPRIL with normal conducting copper coils is not much more expensive than reactors with stationary superconducting coils.

22743 (UCID—19682) **Improbability of a resonance breakdown in quasi-optical ECRH beam systems for the Magnetic Fusion Test Facility and other mirror systems.** Shearer, J.W. (Lawrence Livermore National Lab., CA (USA)). Feb 1983. Contract W-7405-ENG-48. 20p. NTIS, PC A02/MF A01. Order Number DE83008480.

Quasioptical electron-cyclotron resonant heating (ECRH) beam transmission systems have been proposed for mirror systems as an alternative to pressurized waveguides. An important concern in these systems is the possibility of breakdown and plasma buildup in the fundamental resonance region in the vacuum outside of the plasma. We consider some simple physical arguments concerning both plasma breakdown and Budden tunneling and conclude that breakdown and plasma buildup can be avoided. Our summary lists six steps to consider taking when designing such a quasioptical beam system.

22744 (UCID—19730) **Fusion-neutron effects on magnetoresistivity of copper stabilizer materials.** Guinan, M.W.; Van Konynenburg, R.A. (Lawrence Livermore National Lab., CA (USA)). 24 Feb 1983. Contract W-7405-ENG-48. 27p. NTIS, PC A03/MF A01. Order Number DE83008084.

The objective of this work is to quantify the changes which occur in the magnetoresistivity of coppers (having various purities and pretreatments, and at magnetic fields up to 12 T during the course of sequential fusion neutron irradiations at about 4°K and anneals to room temperature. In conjunction with work in progress by Coltman and Klabunde of ORNL, the results should lead to engineering design data for the stabilizers of superconducting magnets in fusion reactors. These magnets are expected to be irradiated during reactor operation and warmed to room temperature periodically during maintenance.

22745 (UCID—19733) **Preliminary conceptual design study of a suppressed-fission tokamak hybrid.** Grady, D.; Berwald, D.; Garner, J.; Jassby, D.; Karbowski, J.; DeVan, J.; Lee, J.D.; Moir, R.W. (Lawrence Livermore National Lab., CA (USA)). Jan 1983. Contract W-7405-ENG-48. 52p. NTIS, PC A04/MF A01. Order Number DE83008428.

A preliminary design concept for a commercial-size tokamak fusion breeder with a suppressed fission blanket and emphasis on ^{233}U breeding has been formulated. The design is based upon a similar tandem mirror hybrid concept and addresses particular concerns relating to the use of a tokamak for the suppressed fission blanket application. The single most important departure from the tandem mirror reference blanket concept is the substitution of

FLIBE for the liquid lithium used for cooling and in-situ tritium breeding. A concern for excessive MHD-related problems drove the decision to replace the more highly conductive lithium. As a result of the new coolant selection, material compatibility issues mandated changes in the composition of the mobile fuel pellets. In addition, the higher operating temperatures associated with the FLIBE placed more stringent constraints on structural requirements and reduced several design margins. Neutronics analyses predicted relatively poor blanket performance with tritium breeding of 1.02 and fissile ^{233}U breeding of 0.34.

22746 (UCRL—15514) Central-cell blanket-module-maintenance approach for the MARS high-temperature blanket. Young, N.; Sutliff, D.; Tait, D.; Siebert, R.; Coulahan, J.; Garner, J.K.; Gordon, J.D. (Ebasco Services, Inc., New York (USA); General Dynamics Corp., St. Louis, MO (USA); TRW Energy Development Group, Redondo Beach, CA (USA)). Dec 1982. Contract W-7405-ENG-48. 5p. (CONF-830406—2). NTIS, PC A02/MF A01. Order Number DE83004309.

From 5. topical meeting on technology of fusion energy; Knoxville, TN, USA (26 Apr 1983).

The general maintenance philosophy for replacement of modules is reviewed in this paper. This includes a discussion of the method for disassembly of the spent module in a hot bay area. An initial equipment requirements list is developed to support the maintenance approach.

22747 (UCRL—52000-82-12, pp 18-29) **Feasibility of inertial confinement fusion.** Dec 1982. NTIS, PC A02/MF A01.

In Energy and Technology Review.

Recent encouraging experiments are cited that demonstrate the efficient coupling of laser light to targets and new ideas for economically competitive power plants are discussed.

22748 (UCRL—88511) Atomic processes in high-density plasmas. More, R.M. (Lawrence Livermore National Lab., CA (USA)). 21 Dec 1982. Contract W-7405-ENG-48. 43p. (CONF-820731—3). NTIS, PC A03/MF A01. Order Number DE83007360.

From North Atlantic Treaty Organization Advanced Study Institute conference on atomic and molecular processes in controlled thermonuclear research; Palermo, Italy (19 Jul 1982).

This review covers dense atomic plasmas such as that produced in inertial confinement fusion. The target implosion physics along with the associated atomic physics, i.e., free electron collision phenomena, electron states I, electron states II, and nonequilibrium plasma states are described. (MOW)

22749 (UCRL—88552) Initial ICRF heating experiments in the TMX-U central cell. Molvik, A.W.; Falabella, S.; Moore, T. (Lawrence Livermore National Lab., CA (USA)). 18 Feb 1983. Contract W-7405-ENG-48. 5p. (CONF-820210—3). NTIS, PC A02/MF A01. Order Number DE83007362.

From NEPCON '82 WEST; Anaheim, CA, USA (23 Feb 1982).

An ion-cyclotron range of frequencies (ICRF) heating system has been installed in the Tandem Mirror Experiment-Upgrade (TMX-U) central cell. Our initial objective is to heat low density ions in the near field of the antenna. This heating reduces the collisionality of central cell ions, which decreases the filling rate of the thermal barrier by passing ions from the central cell. From power- and particle-balance calculations, we determined that 60 kW of absorbed power is sufficient to heat plasma densities of up to 2×10^{13} cm^{-3}. These power requirements are consistent with ion heating results from the Phaedrus tandem mirror. Based on this, we have installed a 200-kW oscillator/power amplifier, tunable to as low as 1.5 MHz. It drives a 110°, 9 1/2-turn loop antenna that has a commercially built Faraday shield and matching network. The system has been tuned with plasma and is being used for the initial heating studies at the ion-cyclotron frequency ω/sub ci/.

22750 (UCRL—88553) ICRF pumping in the TMX-U transition region. Cummins, W.F.; Rensink, M.E. (Lawrence Livermore National Lab., CA (USA)). 18 Feb 1983. Contract W-7405-ENG-48. 8p. (CONF-830210—2). NTIS, PC A02/MF A01. Order Number DE83007361.

From 5. topical conference on radio frequency plasma heating; Madison, WI, USA (21 Feb 1983).

These studies indicate that ICRF transition pumping is feasible in the TMX-U experiment using moderate frequencies and power levels. Some degree of latitude must be included in the final design to compensate the rough calculations. The possibility of coupling near 2 ω/sub ci/ is attractive but awaits a clearer exposition of the theory and an adequate computer code.

22751 Ablative acceleration of planar targets to high velocities. Grun, J.; Obenschain, S.P.; Ripin, B.H.; Whitlock, R.R.; McLean, E.A.; Gardner, J.; Herbst, M.J.; Stamper, J.A. (Naval Research Laboratory, Washington, D. C. 20375). *Physics of Fluids;* **26**: No. 2, 588-597(Feb 1983).

Laser irradiated targets are ablatively accelerated to velocities near those required for fusion pellet implosions while remaining relatively cool and uniform. The target velocities and velocity profiles are measured using a double-foil method, which is described in detail. Also, the ablation plasma flow from the target surface is spatially resolved, and the scalings with absorbed irradiance of the ablation pressure, ablation velocity, and mass ablation rate are determined. Results are compared with hydrodynamic code calculations.

22752 (LA-tr—83-4) Numerical modeling of the formation of H$^-$ ion beams in surface-plasma sources. Davydenko, V.I.; Khavin, N.G. (Los Alamos National Lab., NM (USA)). 1983. Contract W-7405-ENG-36. Translation of IIAF—79-27, 1979. 10p. NTIS, PC A02/MF A01. Order Number DE83007270.

Numerical methods were used to study the formation of H$^-$ ion beams in surface-plasma sources. It was established that changes of the geometry of the beam formation system weakly affect the emittance of the resultant beam, but unevenness of the emission current flux and resonance recharging in the accelerating gap substantially increase it. It was shown that the main distortions in the transverse beam phase volume occur in the very beginning stage of formation.

22753 Solid evacuated microspheres of hydrogen. Foster, C.A.; Hendricks, C.D.; Turnbull, R.J. (to Dept. of Energy). US Patent 4,366,112. 28 Dec 1982. Filed date 22 Jun 1976. vp.

PAT-APPL-698555.

A method is provided for producing solid, evacuated microspheres comprised of hydrogen. The spheres are produced by forming a jet of liquid hydrogen and exciting mechanical waves on the jet of appropriate frequency so that the jet breaks up into drops with a bubble formed in each drop by cavitation. The drops are exposed to a pressure less than the vapor pressure of the liquid hydrogen so that the bubble which is formed within each drop expands. The drops which contain bubbles are exposed to an environment having a pressure just below the triple point of liquid hydrogen and they thereby freeze giving solid, evacuated spheres of hydrogen.

22754 Experimental evidence for self-generated magnetic fields and remote energy deposition in Laser-irradiated targets. Yates, M.A.; van Hulsteyn, D.B.; Rutkowski, H.; Kyrala, G.; Brackbill, J.U. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physical Review Letters;* **49**: No. 23, 1702-1704(6 Dec 1982).

In a series of experiments using two-, four-, and eight-beam 10.6-μm-laser irradiation of a variety of target geometries, a significant amount of energy was found to be deposited in regions remote from the focal spots. The deposition patterns can be predicted with a self-generated magnetic field model.

22755 **In-pile tritium permeation experiment.** Longhurst, G.R.; Miller, L.G.; Watts, K.D. (Idaho National Engineering Lab., Idaho Falls (USA)); Kershner, C.J.; Rogers, M.L. (Monsanto Research Corp., Miamisburg, OH (USA). Mound Facility). *Journal of Nuclear Materials;* **111**: 660-662(Nov-Dec 1982).

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

The experiments in progress are examining various aspects of the permeation of hydrogen isotopes through fusion materials. Of particular importance will be the measurement of permeation due to ion implantation in the presence of a neutron radiation field. Theoretical and early experimental results for these experiments have suggested that sufficient tritium will permeate fusion reactor interior structures that development of a permeation barrier will be needed.

22756 **Deuterium implantation in first wall candidate materials by exposure in the Princeton large torus.** Chang, J.; Tobin, A. (Grumman Aerospace Corp., Bethpage, NY (USA). Research and Development Center); Manos, D. (Princeton Univ., NJ (USA). Plasma Physics Lab.). *Journal of Nuclear Materials;* **111**: 168-172(Nov-Dec 1982).

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

Titanium alloys are of interest as a first wall material in fusion reactors because of their excellent thermophysical and thermomechanical properties. A major concern with their application to the first wall is associated with the known affinity of titanium for hydrogen and the related consequences for fuel recycling, tritium inventory, and hydrogen embrittlement. Little information exists on trapping and release of hydrogen isotopes implanted at energies below 500 eV. This work was undertaken to measure hydrogen isotope trapping and release at the first wall of the Princeton Large Torus Tokamak (PLT).

22757 **Measurement of erosion and deposition of aluminium in EBT.** Clausing, R.E.; Heatherly, L.; Emerson, L.C.; Colchin, R.J. (Oak Ridge National Lab., TN (USA). Metals and Ceramics Div.). *Journal of Nuclear Materials;* **111**: 180-181(Nov-Dec 1982). Contract W-7405-ENG-26.

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

Published in summary form only.

22758 **Gas-fueling studies in the PDX tokamak.** Dylla, H.F.; Blanchard, W.R.; Budny, R.; Fonck, R.J.; Owens, D.K.; Schmidt, G.L. (Princeton Univ., NJ (USA). Plasma Physics Lab.). *Journal of Nuclear Materials;* **111**: 211-217(Nov-Dec 1982).

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

The characteristics of gas-fueling of high power discharges in the PDX tokamak have been investigated using gas-flow, neutral pressure, plasma density, and Hsub(α) emission measurements. The efficiency of gas-fueling was measured for various plasma configurations by comparison of the measured gas-influx rates to the particle exhaust rates inferred from particle decay time measurements. We observe that the fueling efficiency decreases significantly with increasing plasma density as the ionization length for thermal neutrals becomes shorter than the width of the boundary plasma. Gas fueling rates required to maintain a given plasma density are considerably higher (by factors of 5-10) for diverted discharges compared to limiter discharges. This result is attributed to a lower effective recycling coefficient for diverted plasmas. We discuss the dependence of the particle balance on the following experimentally measured parameters: the particle containment time, system pumping speed, and neutral pressure in the vicinity of the active pumps.

22759 **Recycling studies in the ISX-B by monitoring the hydrogen alpha emission.** Young, R.; Thomas, E.W.; Legg, K.O. (Georgia Inst. of Tech., Atlanta (USA). School of Physics); Emmoth, B. (Forskningsinstitutet foer Atomfysik, Stockholm (Sweden)); Cook, T.B. (Oak Ridge National Lab., TN (USA)). *Journal of Nuclear Materials;* **111**: 218-220(Nov-Dec 1982).

From 5. international conference on plasma surface interactions in controlled fusion devices; Gatlinburg, TN, USA (3 - 7 May 1982).

Preliminary studies are reported of hydrogen recycling in the ISX-B Tokamak using Balmer alpha radiation to monitor the local density of hydrogen. Calibrated detectors comprising a narrow band filter, lens and photodiode have been set up at various points around the Tokamak to record Hsub(α) emission from a column intersecting the plasma sheath. For constant plasma conditions the optical signal is shown to be proportional to the local flux of hydrogen entering the plasma from the wall. The response of this signal to gas, neutral beam and pellet injection has been studied in a number of discharges.

22760 **Fracture strength of sintered and siliconized SiC and SiC joints.** Trantina, G.G. (GE, Schenectady, NY, USA). *American Ceramic Society Bulletin;* **61**: No. 5, 555-558(May 1982).

Fracture strength properties that are related to the design of ceramic structures were evaluated. Methods to increase the strength of silicon carbide are described. 13 refs.

22761 **Tensile and torsional fatigue of fiber-reinforced composites at cryogenic temperatures.** Wang, S.S.; Chim, E.S.M.; Socie, D.F.; Gauchel, J.V.; Olinger, J.L. (Univ of Ill, Urbana, USA). *Journal of Engineering Materials and Technology;* **104**: No. 2, 121-127(Apr 1982).

A study of the fundamental fatigue behavior of G-10 grade, glass fiber-reinforced composite laminate in a liquid nitrogen environment is presented. Both uniaxial tensile and pure torsional fatigue failure of the fiber composite are investigated. Cryogenic fatigue degradation of the composite in terms of stiffness reduction, energy dissipation, and cyclic fracture is examined in detail. Influences of loading mode, fiber orientation, surface condition, and geometric variables are studied also. Fatigue damage mechanisms at cryogenic temperatures under various loading conditions are discussed. 29 refs.

22762 **Biaxial fatigue of fiber-reinforced composites at cryogenic temperatures - 1. Fatigue fracture life and mechanisms.** Wang, S.S.; Chim, E.S.M.; Socie, D.F. (Univ of Ill, Urbana, USA). *Journal of Engineering Materials and Technology;* **104**: No. 2, 128-136(Apr 1982).

A study of biaxial fatigue of glass fiber-reinforced composites subjedted to in-phase, cyclic tensile and torsional loading at cryogenic temperatures is presented. Fatigue failure of the composite is investigated in terms of cyclic fracture, stiffness degradation, and energy dissipation. Fatigue fracture lives of the cryogenic composite are obtained for the cases of various combinations of cyclic tensile and torsional stresses. A power-law realtionship is established between the range of cyclic octahedral shear stress and the number of cycles to fracture. Influences of hydrostatic mean stress and stress biaxiality ratio on fatigue fracture of the fiber composite are determined. Fracture mechanisms in the material during the cryogenic biaxial fatigue are examined by using optical and scananing electron microscopes. 21 refs.

22763 **Intertial confinement fusion.** Keefe, D. (Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Annual Review of Nuclear Science;* **32**: No. 1, 391-441(1982). Contract AC03-76SF00098.

The application of laser fusion to the generation of electric power is discussed. (AIP)

22764 **Large magnets: where we are, and where we must go.** Montgomery, D.B. (MIT, Cambridge, MA, USA). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics;* **MAG-17**: No. 5, 1541-1550(Sep 1981). (CONF-810340—).

From 7. international conference on magnet technology; Karlsrube, F.R. Germany (30 Mar 1981).

There is a great deal of interest in magnet technology. There are major projects in construction and serious planes for significant scale-ups; it is therefore of particular value to examine the process of scale-up. For example, some of the future magnets considered by the MHD and Fusion Communities seem very large relative to the present level of accomplishment. Topics discussed include large magnets for high energy physics, energy storage magnets, the Mirror fusion program as well as the tokamak program. Recommendations for a realistic test program are considered. 56 refs.

22765 **EBT-R magnet system concept.** Lieurance, D.W. (Gen Dyn, San Diego, CA). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics;* **MAG-17**: No. 5, 1695-1698(Sep 1981). (CONF-810340—).

From 7. international conference on magnet technology; Karlsrube, F.R. Germany (30 Mar 1981).

The Elmo Bumpy Torus fusion concept has been extrapolated to a 1,200 Mw electrical power plant. The toroidal magnets required will store more than 2,500 times the energy of those proposed for EBT-P. EBT-reactor (EBT-R) magnets may each store 3.5 gigajoules of energy and weigh approximately 750,000 kg. 3 refs.

22766 **Preliminary magnet design for a stellarator fusion reactor.** Van Sciver, S.W.; Derr, J.; Shalil, A.; Sviatoslavsky, I.N. (Univ of Wis, Madison, USA). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics;* **MAG-17**: No. 5, 1703-1706(Sep 1981). (CONF-810340—).

From 7. international conference on magnet technology; Karlsrube, F.R. Germany (30 Mar 1981).

Conceptual design of the superconducting magnets for a stellarator fusion power reactor UWTOR-M are presented. The emphasis in the magnet design is toward modularity and maintainability by approximating the continuous helical coil geometry with a number of discrete windings. Magnetic field requirements are reasonable (B/sub max/ approximately 10 T) allowing for modest extrapolations of present technology. The unique features of the design are: (1) use of NbTiTa with superfluid helium cooling to achieve high current density cryo-stability; (2) a monolithic conductor, made possible by the lack of pulsed magnetic fields; and (3) an innovative construction technique required by nonaxisymmetric geometry of the magnets. 8 refs.

22767 **Light propagation through large laser systems.** Simmons, W.W.; Hunt, J.T.; Warren, W.E. (Lawrence Livermore National Lab., CA). *IEEE (Institute of Electrical and Electronics Engineers) Journal of Quantum Electronics;* **QE-17**: No. 9, 1727-1744(Sep 1981). Contract W-7405-ENG-48.

The evolution of solid-state laser systems over the past decade, both through technological advances and through increased understanding of the interplay between nonlinear effects and linear diffraction, is reviewed. The role of numerical methods to simulate the several physical processes (diffraction, self-focusing, gain saturation) involved in coherent beam propagation through large laser systems is discussed. A comprehensive simulation code for modeling all of the pertinent physical phenomena observed in laser operations (growth of small-scale modulation, spatial filtering, imaging, gain saturation, and beam induced damage) is described in detail. The realism and accuracy of results obtained with this numerical code stem from an unambiguous identification of the sources of spatial noise, and from the use of spatial filters in modern lasers to limit the transverse beam modulation scale within the practical computational range of a two-dimensional numerical analysis. Several comparisons between code results and solid-state laser output performance data are presented. Finally, the design and performance estimation of the large Nova laser system presently under construction at the Lawrence Livermore National Laboratory (LLNL) are given.

22768 **Short-pulse oscillator development for the Nd:glass laser-fusion systems.** Kuizenga, D.J. (Lawrence Livermore National Lab., CA). *IEEE (Institute of Electrical and Electronics Engineers) Journal of Quantum Electronics;* **QE-17**: No. 9, 1694-1708(Sep 1981). Contract W-7405-ENG-48.

This paper describes the development of an actively modelocked and Q-switched (AMQ) Nd:YAG oscillator system that generates a single pulse at 1.06 μm in the range of 100 ps to 1 ns, with energy of ~ 250 μJ, and with good stability and reliability. A stable single axial mode Q-switched oscillator is also described that generates a long smooth pulse out of which pulses in the ns range are sliced. Synchronization of these two oscillators is also discussed.

22769 **Light ion ignitors for inertial confinement fusion: Progress toward proof-of-principle.** Quintenz, J.P.; Kuswa, G.W. (Sandia National Labs., Albuquerque, NM (USA)). pp vp of Annual meeting on nuclear technology '81. Specialists' meeting: Fusion. Eggenstein-Leopoldshaften, Germany; Fachinformationszentrum Mathematik (1981).

From Annual meeting on nuclear technology; Dusseldorf, F.R. Germany (24 Mar 1981).

The progress which has been made forward proof-of-principle using lylet ion ignitors, as well as the remaining problems, are detailed in this paper. Some of the main points are: Target requirements and performance, ion diodes for beam generation, plasma channels for beam transport, pulse power development, reactor concepts, target injection, production of ion beams, and wall protection. (GG).

22770 **Hybrid reactors.** Moir, R.W. (California Univ., Livermore (USA). Lawrence Livermore National Lab.). pp 68 of Annual meeting on nuclear technology '81. Specialists' meeting: Fusion. Eggenstein-Leopoldshaften, Germany; Fachinformationszentrum Mathematik (1981).

From Annual meeting on nuclear technology; Dusseldorf, F.R. Germany (24 Mar 1981).

The rationale for hybrid fusion-fission reactors is the production of fissile fuel for fission reactors. A new class of reactor, the fission-suppressed hybrid promises unusually good safety features as well as the ability to support 25 light-water reactors (LWRs) of the same nuclear power rating, or even more high-conversion-ratio reactors such as the heavy-water type. One 4000-MW nuclear hybrid can produce 7200 kg of ^{233}U per year. To obtain good economics, injector efficiency times plasma gain (etasub(i)Q)-should be greater than 2, the wall load should be greater than 1 MW x m^{-2}, and the hybrid should cost less than 6 times the cost of a light-water reactor. Introduction rates for the fission-suppressed hybrid are unusually rapid. (orig.).

22771 **Material problems in plasma fusion.** Ullmaier, H. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Festkoerperforschung). pp 68 of Annual meeting on nuclear technology '81. Specialists' meeting: Fusion. Eggenstein-Leopoldshaften, Germany; Fachinformationszentrum Mathematik (1981). (In German)

From Annual meeting on nuclear technology; Dusseldorf, F.R. Germany (24 Mar 1981).

In this report the radiation defects in the interior of material of the first wall and the blanket structure are discussed, which are induced by fast neutrons. (GG).

22772 **Overview of the U.S. programme on particle control and divertors.** Oktay, E. pp 17-19 of IAEA Technical Committee meeting on divertors and impurity control. Keilhacker, M.; Daybelge, U. (eds.). Garching, Germany; Max-Planck-Institut fuer Plasmaphysik (1981).

From IAEA Technical Committee meeting on divertors and impurity control in tokamaks; Garching (Germany, F.R.) (6 - 9 Jul 1981).

In this overview, the particle control and divertor issues are reviewed briefly, the status of the U.S. experimental programs relevant to this topic are mentioned, and the future direction of the program is discussed. The results of experiments will be presented by the participants from the U.S. laboratories.

22773 **Recent PDX results.** Bol, K. pp 20-22 of IAEA Technical Committee meeting on divertors and impurity control. Keilhacker, M.; Daybelge, U. (eds.). Garching, Germany; Max-Planck-Institut fuer Plasmaphysik (1981).

From IAEA Technical Committee meeting on divertors and impurity control in tokamaks; Garching (Germany, F.R.) (6 - 9 Jul 1981).

PDX Group.

In this paper the authors first summarize the machine aspects that bear on impurity control, then impurity injection experiments, fueling of the discharge and energy flow with and without beam injection, and finally the present status of the beam injection experiment and the encouraging results that have been obtained.

22774 **Expanded boundary divertor experiments in Doublet III.** Wesley, J.C.; Brooks, N.; De Boo, J.C.; DeGrassie, J.S.; Groebner, R.J.; Hsieh, C.L.; Mahdavi, M.A.; Ohyabu, N.; Stambaugh, R.D.; Taylor, T. pp 32-34 of IAEA Technical Committee meeting on divertors and impurity control. Keilhacker, M.; Daybelge, U. (eds.). Garching, Germany; Max-Planck-Institut fuer Plasmaphysik (1981).

From IAEA Technical Committee meeting on divertors and impurity control in tokamaks; Garching (Germany, F.R.) (6 - 9 Jul 1981).

The expanded boundary divertor is a simplified poloidal divertor configuration where the outermost flux surfaces of the plasma are expanded and diverted to interact the walls near the midplane of the vacuum vessel by coils located outside the vessel. Impurity exhaust is discussed and desirable divertor 'geometry aspects'.

22775 **Remote radiative cooling and helium ash exhaustion with single-null poloidal divertor in Doublet III.** Nagami, M.; Shimada, M.; Ioki, K.; Izumi, S.; Maeno, M.; Yokomizo, H.; Shinya, K.; Yoshida, H.; Brooks, N.; Hsieh, C.L. pp 35-37 of IAEA Technical Committee meeting on divertors and impurity control. Keilhacker, M.; Daybelge, U. (eds.). Garching, Germany; Max-Planck-Institut fuer Plasmaphysik (1981).

From IAEA Technical Committee meeting on divertors and impurity control in tokamaks; Garching (Germany, F.R.) (6 - 9 Jul 1981).

This work presents the remote radiative cooling at the divertor and helium exhaustion function with the single null poloidal divertor in Doublet III, discusses the formation of divertor equilibrium and impurity control with this simplified divertor, localized particle accumulation and recycling at the divertor, remote radiative cooling, helium ash exhaustion.

22776 **Divertor scrape-off studies.** Owens, D.K. pp 38 of IAEA Technical Committee meeting on divertors and impurity control. Keilhacker, M.; Daybelge, U. (eds.). Garching, Germany; Max-Planck-Institut fuer Plasmaphysik (1981).

From IAEA Technical Committee meeting on divertors and impurity control in tokamaks; Garching (Germany, F.R.) (6 - 9 Jul 1981).

The investigation of the scrape-off plasma in the Poloidal Divertor Experiment plasma parameters, energy balance and particle flow in diverted discharges. A simple particle flow model has been used to provide a framework for interpreting the measurements and to suggest the physical processes which must be included in any model of the plasma. The topics for which experimental results are presented and discussed include particle and energy flow in double and single null divertor configurations, energy balance and edge plasma density dependence on main plasma density, fueling by gas puff, edge plasma parameters, and recycling from the divertor. Initial results from pellet injection and neutral beam heating as these topics relate to fueling and edge plasma conditions are also presented.

22777 **Divertor modelling.** Schmidt, J.A. pp 55-57 of IAEA Technical Committee meeting on divertors and impurity control. Keilhacker, M.; Daybelge, U. (eds.). Garching, Germany; Max-Planck-Institut fuer Plasmaphysik (1981).

From IAEA Technical Committee meeting on divertors and impurity control in tokamaks; Garching (Germany, F.R.) (6 - 9 Jul 1981).

Models have been developed for the behavior of poloidal divertor channels in tokamaks. The purpose of these computer codes is to improve our understanding of present divertor experiments and project the conditions for future divertor operation. The most advanced codes include a Monte Carlo analysis of the multispecies neutral behavior coupled to a plasma model comprising a particle and energy flow algorithm. Initial studies with these codes indicate an important mode of divertor operation with very little neutral backflow from the divertor channel. The associated plasma influx to the divertor is also small, producing a high density, relatively low temperature edge condition.

22778 **Numerical simulations of the bundle divertor.** Howe, H.; Wootton, A.J. pp 64 of IAEA Technical Committee meeting on divertors and impurity control. Keilhacker, M.; Daybelge, U. (eds.). Garching, Germany; Max-Planck-Institut fuer Plasmaphysik (1981).

From IAEA Technical Committee meeting on divertors and impurity control in tokamaks; Garching (Germany, F.R.) (6 - 9 Jul 1981).

Published in summary form only.

22779 **TFTR impurity control.** Meade, D.M. pp 88-90 of IAEA Technical Committee meeting on divertors and impurity control. Keilhacker, M.; Daybelge, U. (eds.). Garching, Germany; Max-Planck-Institut fuer Plasmaphysik (1981).

From IAEA Technical Committee meeting on divertors and impurity control in tokamaks; Garching (Germany, F.R.) (6 - 9 Jul 1981).

TFTR is a high-energy-density beam-driven tokamak that will utilize both two-component and thermonuclear DT reactions to achieve 'approximate energy breakeven' in the mid 1980's. High-energy-density plasmas, disruptions and DT operation impose severe design constraints on the TFTR impurity control system. The TFTR energy removal system consists primarily of a large area axisymmetric toroidal limiter covered with TiC coated graphite tiles. Recycling control is accomplished with a regenerable Zr Al getter pump that covers approx. equal to 10% of the torus wall. The performance of TFTR will depend significantly on the success of the TFTR impurity control system. This paper gives a status report on the requirements, design concepts and prototype tests for the moveable limiter, bellows cover plates, bumper limiter, and surface pumping system.

22780 **Modelling of the INTOR poloidal divertor.** Post, D.E.; Petravic, M.; Schmidt, J.A.; Heifetz, D. pp 96 of IAEA Technical Committee meeting on divertors and impurity control. Keilhacker, M.; Daybelge, U. (eds.). Garching, Germany; Max-Planck-Institut fuer Plasmaphysik (1981).

From IAEA Technical Committee meeting on divertors and impurity control in tokamaks; Garching (Germany, F.R.) (6 - 9 Jul 1981).

Computational models have been used to assist in the design of a poloidal divertor system for INTOR. The divertor is to be used to handle and control the expected particle and heat outflux from INTOR of approx. equal to 10^{23} particles/sec and 80-100 MW of thermal plasma energy. The divertor must be able to handle the heat load without excessive cooling requirements for the neutralizer plates and divertor walls, and without large erosion rates for the divertor walls and neutralizer plates. Large erosion rates would lead to unacceptably large impurity levels in the main plasma and require frequent replacement of the divertor structure. 100 MW of fusion thermal power corresponds to a production of approx. equal to 2 x 10^{20} alpha particles/sec. This helium ash must be removed from the discharge to allow long pulse (approx. equal to 50 sec) operation. A two dimensional model was constructed to examine these questions. The neutral gas transport is calculated using Monte Carlo techniques. The collisions of neutrals and ions with the walls are handled using experimental reflection data. The relevant atomic collision processes are included.

22781 TFTR impurity control prototype tests. Cecchi, J.L.; Dylla, H.F.; Fonck, R.J.; Knize, R.J.; Kugel, H.W.; Okabayashi, M.; Owens, D.K.; Ulrickson, M.; Sredniawski, J.J. pp 97 of IAEA Technical Committee meeting on divertors and impurity control. Keilhacker, M.; Daybelge, U. (eds.). Garching, Germany; Max-Planck-Institut fuer Plasmaphysik (1981).

From IAEA Technical Committee meeting on divertors and impurity control in tokamaks; Garching (Germany, F.R.) (6 - 9 Jul 1981).

The control of impurities and hydrogen recycling in TFTR are essential elements in realizing the most favorable operating parameters for the device. Work in this area has included calculations to optimize limiter configurations. Another major effort has been the investigation of possible surface pumping systems to control impurities and recycling while being compatible with the TFTR radiated heat load and the requirement to generate adsorbed tritium. We have undertaken a series of prototype experiments which are described.

22782 ISX divertor program. Jernigan, T.C.; Lyon, J.F.; Montgomery, D.B.; Sheffield, J.; Wing, W.R.; Rome, J.A.; Hively, L.M.; Wootton, A.J.; Wysor, R.B.; Yang, T.F. pp 101 of IAEA Technical Committee meeting on divertors and impurity control. 22784 Mechanical divertors design considerations. Schmidt, J.A. pp 123-125 of IAEA Technical Committee meeting on divertors and impurity control. Keilhacker, M.; Daybelge, U. (eds.). Garching, Germany; Max-Planck-Institut fuer Plasmaphysik (1981).

From IAEA Technical Committee meeting on divertors and impurity control in tokamaks; Garching (Germany, F.R.) (6 - 9 Jul 1981).

Tokamak experiments wich mechanical limiters have demonstrated their acceptability under present operating conditions. The simplicity of mechanical limiter configurations make them a good candidate for future tokamak edge control. To be acceptable for reactor applications, provision must be made for the removal of helium ash. Present design studies indicate that limiters with pumping channels will facilitate helium removal. An experimental data base has been developed which supports the use of limiters in this role.

22785 Pumped limiter development on ISX. Mioduszewski, P.K.; Edmonds, P.H.; Sheffield, J. pp 127 of IAEA Technical Committee meeting on divertors and impurity control. Keilhacker, M.; Daybelge, U. (eds.). Garching, Germany; Max-Planck-Institut fuer Plasmaphysik (1981).

From IAEA Technical Committee meeting on divertors and impurity control in tokamaks; Garching (Germany, F.R.) (6 - 9 Jul 1981).

Pumped limiter configurations are being suggested for FED and INTOR for helium ash exhaust and fuel particle control. The goal of the pump limiter studies in ISX is the selection of the most promising concept and its evaluation in the ISX-C device under the following conditions: 1. quasi steady state operation (<= 30s), 2. high edge power densities, 3. particle control by means of mechanical devices. We are considering various options, including particle scraper and ballistic particle collection concepts as well as the current FED design. In ISX-B we will test a full-size pump limiter and directly compare the heat removal and particle control capabilities with a bundle divertor. In ISX-C the steady state operation characteristics of pump limiters will be explored.

22786 PDX mechanical divertor experiments. Jacobsen, R. pp 130-131 of IAEA Technical Committee meeting on divertors and impurity control. Keilhacker, M.; Daybelge, U. (eds.). Garching, Germany; Max-Planck-Institut fuer Plasmaphysik (1981).

From IAEA Technical Committee meeting on divertors and impurity control in tokamaks; Garching (Germany, F.R.) (6 - 9 Jul 1981).

A preliminary plasma edge particle scoop limiter has been installed on the equator of the Princeton Divertor Experiment (PDX), a large tokamak. The scoop limiter is unique in that it is designed such that the plasma plugs the entrance throat thereby impeding the return flow of neutralized gas to the discharge. Neutral gas pressures of the order of 50 microns were measured inside the scoop. The pressure dependence on electron density in the scrapeoff plasma at the throat entrance was stronger than linear. A full size scoop limiter is under construction and will soon be installed on PDX. It has been designed to be sufficiently thermally robust so as to act as the sole limiter in a PDX discharge with 1.5 MW of neutral beam heating.

22787 Cluster beam ionizer having the self-acceleration mechanism. Be, S.H.; Yano, K.; Kodaira, K.; Kawai, S. (Inst of Phys and Chem Res, Saitama, Japan). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1506-1509(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The purpose of the present paper is to describe the results of the computer simulation and the experiment on the new cluster ionizer proposed before. The gradient of the space-potential in the ionizer has an axial component that favors the cluster ion beam flow. This was ascertained from the results of the computer simulation and the experiment.

22788 Structural performance of plasma chamber design concepts for EBT-P. Ruester, D.E.; Delaney, M.J. (McDonnell Douglas Astronaut Co, St. Louis, MO, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1709-1712(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The plasma chamber for the Elmo Bumpy Torus - Proof of Principle (EBT-P) must maintain a vacuum tight enclosure under an intense x-ray and microwave heating environment. A conceptual design study was conducted to determine the feasibility of a stainless steel plasma chamber that uses metal seals. Due to the low thermal conductivity of stainless steel, life of the plasma chamber is very design dependent. However, a stainless steel integrally cooled plasma chamber design was shown to satisfy a 10-year life requirement for EBT-P.

22789 Fuel density-radius diagnostic for inertial confinement fusion experiments. Blue, T.E.; Durham, J.S.; Reyes, J.J.; Wehring, B.W.; Blue, J.W. (Univ of IL, Urbana, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1051-1054(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The fuel density-radius product (/rho/R) is an important parameter in inertial confinement fusion (ICF) experiments. A number of methods for measuring the tamper and fuel /rho/R of ICF targets have been proposed and developed. This paper considers a diagnostic for the direct measurement of fuel /rho/R in D/sub 2/ filled ICF targets.

22790 Fusion-product energy-loss measurements from laser-imploded micro-balloons. Miley, G.H.; Choi, C.K.; Blue, T.E.; Bennish, A.H.; Coggeshall, S.V.; Harris, D.B. (Univ of Ill, Urbana, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1055-1057(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

Measurements of charged fusion-product-energy spectra as a diagnostic for the determination of /rho/R of the fuel and tamper in inertial-confinement targets, and the study of possible anomalous effects in the slowing down of the charged fusion-products in extremely high density and temperature plasmas is performed.

22791 Infrared monitoring of the Doublet III beam armor plate. McMahon, T.; Kamperschroer, J.; Colleraine, A.; Kim, J.; McColl, D.; Tooker, J.; Treglio, J. (Gen At Co, San Diego, CA, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1071-1073(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

An 80 keV, 3.6 MW neutral beam injection system has recently been installed on Doublet III, and the installation of a second system is scheduled within several months. Armor plate consisting of /approximately equals/100 graphite tiles (10 cm x 10 cm) coated with TiC has been plated over portions of the inner vacuum wall lying in the line of sight of the ion sources. In order to monitor the condition of the armor plate an infrared camera and a set of optical pyrometers have been installed alongside the beamline and view the armor plate through a CaF/sub 2/ window. The pyrometers measure the temperature of the armor plate associated with the maximum of the intensity distribution of each ion source.

22792 CAMAC module for waterflow calorimetry. Jacobson, V.; Fiddler, J.; Greer, J. (Lawrence Berkeley Lab, CA, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1078-1081(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

Waterflow calorimetry would seem to be a natural diagnostic for Neutral Beam Injectors: it requires simple transducers, is non-destructive and directly measures the 'bottom line' number of delivered neutral power. Real Time Systems Group, Lawrence Berkeley Laboratory has developed a micro-processor based CAMAC module for doing waterflow calorimetry which gives an energy measure accurate to better than 2% within 1 minute after a shot. The modules are relatively inexpensive and have been proven in normal operation at LBL's Neutral Beam System Test Facility. This paper describes the module and experience gained in its development and operation.

22793 Design and analysis of a stable support structure for TFTR diagnostics. Zatz, I.J.; Lontai, L.; Goldfarb, S. (Princeton Univ, NJ, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1122-1125(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The Multichannel Far Infra Red Interferometer (MIRI) for TFTR employs phase comparison of 119 micrometer radiation in a Michelson (double pass) configuration for measurement of plasma electron density. MIRI accommodates up to ten vertical probing beams approximately evenly spaced across the plasma minor diameter. To reduce relative movement of critical components of these diagnostics, a stiff, damped, isolated structure was designed. Long-term drifts such as thermal effects and creep are compensated just prior to the measuring interval. The structure is designed to provide short term stability with excitation from machine electromagnetic fields and building vibration during the nominal one second measuring period. The design process allowing for this stability was aided and optimized by using dynamic applications of the finite element method.

22794 Fusion engineering development plan. Haas, G.M. (US DOE, Washington, DC, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 15-19(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The Fusion Engineering Development Plan (FEDP) is a lengthy document over a hundred pages, representing a substantial amount of detail. This paper presents the background and the thinking that went into putting this Plan together, rather than to explore in detail the material that is in the Plan. Discussed are the objectives and the elements of FEDP. They include plasma systems, nuclear systems, reactor systems, and system integration.

22795 Perspective on the industrial role in fusion. Kummer, D.L. (McDonnel Douglas Astronaut Co, St. Louis, MO, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 20-22(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The paper discusses the variety of industrial companies working with fusion. It lists the reasons why industry should be involved in the fusion development phase. How industry might be involved in fusion is summarized. Also discussed are some of the major subsystems and areas of work in fusion programs, and some of the factors that determine the choice.

22796 Technology transfer: the key to fusion commercialization. Burnett, S.C. (Gen At Co, San Diego, CA, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 23-25(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The paper brings to light some of the reasons why technology transfer is difficult in fusion, examines some of the impediments to the process, and finally looks at a successful example of technology transfer. The paper considers some subjective features of fusion - one might call them the sociology of fusion - that are none the less real and that serve as impediments to technology transfer.

22797 General approach to quality in design. Osborne, W.J. (Princeton Univ, NJ, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 27-29(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

Design engineers, either consciously or unconsciously, use quality work elements to achieve quality in design. these quality work elements are identified, classified as basic or optional, and explained. The rationale for applying them to the design of fusion devices is presented in terms of effects on performance and costs. Relevant quality terms are defined, and elements of the design quality system are described. Quality of design is the direct responsibility of the design engineer.

22798 Enhanced operations through designing in reliability and maintainability. DeMund, T.W. (Grumman Aerosp Corp, Bethpage, NY, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 30-33(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

This paper describes the application of Reliability and Maintainability Programs tailored from the requirements found in MIL-STD-785 and MIL/STD-470 and applied to the design of the Tokamak Fusion Test Reactor. The program had three primary objectives, to prove the adaptability of the tailored methods to an experimental system, to provide tangible improvements to the design of IFTR by the application of Reliability and Maintainability techniques, and to provide an indoctrination to the design personnel by participation in the design process.

22799 **Designing quality into software.** Becker, D.R. (Lawrence Livermore Natl Lab, CA, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 34-36(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

Software Quality Assurance has become an area of high interest because of expectations of higher programmer productivity, fewer errors in the final program, and thus overall reduced costs for software development. QA techniques are conceptually simple and should be implemented prior to software design or code writing. This paper briefly describes the QA techniques implemented for MFTF-B.

22800 **Interfacing between concrete and steel construction and fusion research devices.** Willoughby, E. (Giffels Assoc Inc, Southfield, MI, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 37-38(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

In 1976 Giffels Associates, Inc. an architect/engineer organization, was retained by the United States Department of Energy to provide Title I and Title II design services and Title III construction inspection services for the Tokamak Fusion Test Reactor now being installed at the Princeton Plasma Physics Laboratory in Princeton, New Jersey. Construction of the complex required to house and serve the reactor itself, designed by others, now commencing. During building construction several problems occurred with respect to the interface between the building design, construction and the fusion device (reactor). A brief description of some of these problems and related factors is presented, which may be of benefit to those persons active in continuing fusion research and experimental work.

22801 **Exchange of design quality 'lessons learned'.** Bohn, F.H. (Kernforschungsanlage Juelich, Germany, F.R.). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 39-42(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

This paper has been prepared for the use of the attendees of the quality assurance workshop: 'How can more quality be designed into fusion facilities?' The topics are chosen for discussion and development of subsequent summaries during the workshop. They concentrate therefore on specific subjects of quality assurance for the design phase of fusion projects. Special emphasis is given to the question how can design quality be improved to quality assurance approaches and to tools. Examples on lessons learned are shown.

22802 **Engineering overview of EBT-P device systems.** Hamilton, W.R.; Imster, H.F. (Union Carbide Corp, Oak Ridge, TN, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 47-50(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The device and the facility for the Elmo Bumpy Torus Proof of Principle (EBT-P) experiment are to be constructed at the Valley Industrial Park at Oak Ridge, Tennessee by the McDonnell Douglas Astronautics Company under contract to the Union Carbide Corporation - Nuclear Division. This paper describes the major design features of the overall EBT-P device and each of its systems.

22803 **Bottoms up design of the Elmo Bumpy Torus - proof of principal (EBT-P) fusion research facility.** Erickson, D.T. (McDonnell Douglas Astronaut Co, St. Louis, MO, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 56-59(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The McDonnell Douglas Astronautics Company, under subcontract to the Union Carbide Corporation Nuclear Division at the DOE Oak Ridge National Laboratory has committed to furnish the EBT-P research facility. Gilbert Associates, Inc. of Reading, Penysylvania, as the Architect and Engineering subcontractor has been selected for design and construction of this facility. The bottoms up effort to provide the EBT-P facility is now alive and well, with the property purchased, dedication ceremonies conducted, the Preliminary Design effort completed and detail design currently active.

22804 **Role of systems integration in EBT-P.** Hass, D.W. (McDonnell Douglas Astronaut Co, St. Louis, MO, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 60-63(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

Systems integration is an element of design engineering dealing with configuration management, interface control, maintainability and design-to-cost analyses. Configuration management consists of identification, control, and status accounting of the configuration. The flow of these elements throughout the engineering cycle is presented. Typical maintainability design criteria for seals, disconnects, lines, etc. are described as they apply to EBT-P. Design-to-cost analyses are essential in examining the overall design and defining the lowest cost alternatives which affect both construction and operating costs. Every proposed design change is accompanied by a detailed cost assessment. Several examples of cost savings design techniques to be used on EBT-P are discussed.

22805 **EBT-P instrumentation and control system - overview.** Schmitt, R.J. (McDonnell Douglas Astronaut Co, St. Louis, MO, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 64-67(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

MDAC-STL is currently under contract to ORNL to design and construct the EBT-P device at a non-government-owned site in Oak Ridge, Tenn. Design of the EBT-P Instrumentation and Control (L and C) design has been underway since Oct. 1980. The RFP baseline (I and C) design has been iterated into a preliminary design which has recently been reviewed by ORNL and DOE. This paper presents an overview of the I and C System design as it exists now that is keyed to the EBT-P facility layout.

22806 **EBT-P data acquisition system design.** Boyd, B.A. (McDonnell Douglas Astronaut Co, St. Louis, MO, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 68-71(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The data acquisition system for EBT-P is being designed to fulfill five major EBT-P device data handling functions: acquisition, display, processing, storage, and transmission. These functions are performed by a hierarchical system of micro- and mini-computers arranged in a flexible network structure. The facility computer has responsibility for gathering data from the various subsystem microprocessors, storing it for both near-term access and permanent historical record, and displaying it on the EBT-P master control console (MCC) CRT display panels. The main operator interface to the computer is via several color graphics display terminals in the EBT-P (MCC). Programmable Logic Controllers which have the major responsibility for EBT-P device control and interlocking also feed data to the microprocessors via a high-speed data highway link.

22807 **Remote welding and cutting for the JET project.** de Burbure, S.; Galbiati, L.; Raimondi, T. (JET Jt Undertaking, Abingdon, Oxfs, England). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1138-1142(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

There are increasing requirements for joining, separating and rejoining pipes or ducts of various shapes for very demanding applications, such as high vacuum or sodium containment in a radioactive environment. Welding is considered, in these cases, the most reliable joining method. In general the joining and separating operations must be repeated a number of times and motorized carriages automatically guided are envisaged. This solution is often preferred even if personnel access is allowed as it gives reliable results and avoids human errors. This paper discusses the problems encountered and gives viable solutions.

22808 Influence of reactor maintenance considerations on the design of a commercial EBT power plant. Zuckerman, D.S. (McDonnell Douglas Astronaut Co, St. Louis, MO, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1158-1161(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

An analysis of the scheduled reactor maintenance requirements of an Elmo Bumpy Torus Reactor (EBTR) and their effect on the reactor and reactor-building design was performed. The requirements for scheduled maintenance are that blanket replacement be accomplished in less time than that required for annual scheduled balance-of-plant maintenance (28 days), that capital and operating costs be minimized and availability maximized. Three circular reactor-building concepts were evaluated: a reactor building with permanent space outboard of the reactor for maintenance operations; a building with permanent maintenance space above the reactor; and a mobile maintenance module concept where the module moves around the perimeter of the reactor building and provides temporary space for maintenance at the required location. This paper presents the rationale for selection. of the first option. Time estimates and equipment requirements for first-wall/blanket/shield (FWBS) replacement are presented.

22809 TFTR diagnostic voltage loops. Cavalluzzo, S.; Goldfarb, S. (Princeton Univ, NJ, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1162-1164(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

Voltage loops are single turn coils positioned parallel to the toroidal plasma column which provide a measure of the ohmic heating voltage. The loops are formed by stranded stainless steel conductors with polyimide insulation which are threaded through segmented tubes attached to the exterior of the vacuum vessel. This paper briefly reviews the voltage loop function and presents the design requirements. The design solution is described and the remote handling installation tools and procedure are described and illustrated. Environmental tests and installation trials using a full scale mockup are reported.

22810 Conceptual design of laser fusion reactor, SENRI-I - 1. concept and system design. Ido, S.; Naki, S.; Norimatsu, T. (Osaka Univ, Japan). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1184-1187(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

Design features of a laser fusion reactor concept SENRI-I and new concepts are reviewed and discussed. The unique feature is the utilization of a magnetic field to guide and control the inner liquid Li flow. Basic requirements and typical parameters used in the design are presented. Items to be discussed are constitution of the system, performance of liquid Li flow, neutronics, thermo-electric cycle, fuel cycle and new concepts.

22811 Conceptual design of laser fusion reactor, SENRI-I - 2. tritium breeding ratio, neutron streaming to laser beam ports and final mirrors. Oomura, H.; Ido, S.; Nakai, S.; Yamanaka, C. (Ishikawajima-Harima Heavy Ind Co, Tokyo, Japan). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1188-1191(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The purpose of this study is to investigate the neutronics and photonics features of the SENRI-I, especially the effects of laser beam ports on the blanket neutronics and to estimate the fluence of laser beam guide mirrors. Models and data used are briefly described. Flux distribution thermal deposition in the blanket, tritium breeding and the d.p.a. (displacement per atom) are examined and neutronic behavior of final elements are discussed.

22812 Global trade studies for the fusion engineering device (FED). Reid, R.L.; Wu, K.F. (Oak Ridge Natl Lab, TN, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1298-1301(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The effects of plasma minor radius, neutron wall loading, and inboard shield thickness on FED performance and cost were examined. It was observed that decreasing the plasma radius, at fixed wall loading, yields an increased burn time at the expense of a reduction in Q and slightly increased cost. It was also found that increasing the neutron wall loading /plus or minus/20/PERCENT/ resulted in a change of /plus or minus/10 720 in capital cost. It was further observed that inboard shield thickness variation has a minimal effect on capital cost when maintaining a fixed plasma minor radius and a fixed field at the TF coils.

22813 FED control power. Murray, J.G.; Bronner, G. (Princeton Univ, NJ, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1302-1305(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

Position control of the plasma in FED or in any reactor type of magnetic toroidal confined fusion machine becomes more of an engineering challenge than the present day plasma experimental devices. This paper briefly describes the structural features which play a dominant role in effecting position control and emphasizes the differences associated with present experimental devices and reactor relevant machines. It outlines the features of startup and disruption to describe their interdependence in determining the design requirements for control. An explanation of the scope of this study is provided with the procedures established to investigate position control requirements. The assumption made and a description of the specific components of the structures which were included in the studies are given. The present FED results and conclusions are then presented.

22814 Performance of the BNL Mk-V steady state magnetron H source. Hershcovitch, A.; Prelec, K.; Alessi, J. (Brookhaven Natl Lab, Upton, NY, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1368(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The MkV magnetron source has been designed with the goal to achieve an H-or D-yield of 1-2 A in pulses longer than 5 s up to a steady state mode of operation. All electrodes are water cooled and this allows power densities up to 200 W/cm/sup 2/. The source has been operated in hydrogen and hydrogen-cesium modes. Various methods of cesium vapor injection have been tried and their reliability compared. The extractor grid in its first version has been made out of solid molybdenum, without cooling, and operated in a pulsed mode (pulse length more than 1 s).

22815 Performance of the Culham multi-megawatt beam line facility. Hammond, D.P.; Cottrell, G.A.; Coupland, J.R. (Culham Lab, Abingdon, Oxfs, England). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1538-1541(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The Culham Megawatt Beam Line has been upgraded in order to test injector modules for the JET experiment. The major items provided are: a high voltage modulator tube system, modified auxiliary supplies, new vacuum tanks and cryopumps, a high power beam pump, additional tanks and cryopumps, a high power data acquisition system. Delivery of the first complete JET prototype source and accelerator was scheduled for the end of 1981. The major components, having been tested separately as far as possible, are now installed and are being tested up to the 80kV, 12A level of the existing plasma source.

22816 **Facility approach to tokamak operation.** Edmonds, P.H.; Gabbard, W.A. (Oak Ridge Natl Lab, TN, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1692(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

In anticipation of the appearance of more advanced tokamaks and other fusion relevant experiments, program has been established at ORNL to systemically identify the requirements of an effective machine operations group. This program is presently applied to the ISX-B experiment. With its continuing development, it is expected to provide major support in the identification of potential problem areas and to assist in the generation of the necessary procedures for forthcoming devices. The present and future generations of large plasma devices will function as facilities, operated by an operations group as service to the plasma physicists and diagnosticians. The purpose of the program discussed here is to develop and to encourage an orderly transition to the facility-like style of operation.

22817 **Engineering design of the Beta IV experiment.** Morse, E.C.; McNamara, B. (Univ of Calif, Berkeley, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1693-1696(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The Beta IV reactor design is a conceptual extension of the current Beta-II project at LLNL which would test various engineering systems in a fusion environment. This device would extend the technology of compact torus plasma confinement from present experiments to a small-scale power producing device. The reactor studied in this report was chosen to have a thermonuclear power output of 100 MWth and a Q of 25. Injected power is therefore 4 ME in long pulse, with a startup gun providing an initial energy input of 50 MJ. start up is accomplished by a Marshall type gun which is scale-up of the presently operating Beta-II gun.

22818 **Fabrication of the bonded center leg for TEXT iron yoke.** Polk, D.H.; McFarlin, D.J. (United Technol Corp, East Hartford, CT, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1697-1700(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The center leg of the Texas Experimental Tokamak (TEXT) iron yoke is designed not only to maximize and mounting structure. In particular, it reacts the forces and moments on the toroidal field coils, resulting in local shear stresses up to 1000 psi. Because of these structures required to minimize eddy current losses could not be fabricated using conventional transformer core techniques. Instead, the center leg structure was formed from 0.660 in., type C1010 steel plates, zinc phosphate treated to enhance bond adhesion and to provide interlaminar insulation, and bonded with an epoxy adhesive. Upon installation, the specified 1.6 volt-sec flux change was confirmed in low power tests, and, in TEXT machine operations to date, the leg has met all electrical and structural requirements.

22819 **Varennes tokamak - an experiment for fast current rampdown, quasi-continuous operation and impurity control studies.** Couture, P.; Geoffrion, J.; Gregory, B.C.; Van Andel, H.W.H.; Bolton, R.A.; Cumyn, P.B.; Stansfield, B.L.; Terreault, B. (Hydro-Que, Varennes, Canada). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1701-1704(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

The parameters and special features of the Varennes quasi-continuous tokamak are presented and the poloidal field is discussed in some detail.

22820 **Thermoelectric MHD affects heat flow in fusion technology.** Shercliff, J.A. (Univ of Cambridge, England). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1794-1796(1981). (CONF-811040—).

From 9. symposium on engineering problems of fusion research; Chicago, IL, USA (26 Oct 1981).

Seebeck currents generated at the interface between liquid lithium and its container In a magnetic field cause motions which affect the relation between the temperatures and the heating/cooling, and hence the thermal expansion and stresses. Unsteadiness could cause thermal cycling. The paper surveys the present level of understanding of TEMHD thermal convection, indicating likely effects and the scope for exploiting them or the dangers which they imply.

22821 **Argonne plasma engineering experiment (APEX) tokamak.** Norem, J.H.; Balka, L.J.; Kulovitz, E.C.; Magill, S.R.; McGhee, D.G.; Moretti, A.; Praeg, W.F. (Argonne Natl Lab, IL, USA). *Proceedings of the Symposium on Engineering Problems of Fusion Research;* 1680-1683([nd]).

This paper describes the design and operation of the Argonne Plasma Engineering Experiment (APEX) tokamak. This machine was designed to provide a high performance plasma at a minimum cost, thus combining, to some extent, The high current densities, long pulse duration, and flexibility of operation of large, multipurpose machines, with the low cost of small machines. The APEX tokamak was designed specifically for studies in plasma-wall interactions and RF heating and current drive, and some tradeoffs were made in order to optimize the device for this purpose. Special features of this design included use of the self-centering force of the toroidal field coil to simplify the mechanical design of the coils and digital equilibrium field control.

99 GENERAL AND MISCELLANEOUS

22822 **(DOE/IR/05114—1) Energy Deskbook.** Glasstone, S. (Glasstone (Samuel), Oak Ridge, TN (USA)). Jun 1982. Contract AC05-76IR05114. 463p. NTIS $12.50.

The purpose of the Energy Deskbook is to serve as a convenient reference to definitions of energy-related terms and descriptions of current and potential energy sources and their utilization. The material is presented at a low technical level with emphasis on general principles, which are not difficult to understand, rather than technology. The entries vary in length from a few lines to several pages, according to circumstances. As a general rule, each topic is defined and outlined in the first paragraph; this may be followed by a more detailed treatment, as required. An important feature of the Deskbook is the use of boldface (heavy) type for cross references. Words in the text set in boldface are the titles of articles where the particular subjects are described.

22823 **(UCRL—88686) Decision-making in large-scale military simulation: a requirement for expert systems.** Erickson, S.A. Jr.; Balaban, D.J.; Nelson, D.O. (Lawrence Livermore National Lab., CA (USA)). 1 Feb 1983. Contract W-7405-ENG-48. 22p. NTIS, PC A02/MF A01. Order Number DE83007343.

Computerized war-gaming and combat simulation represents a very fertile application area for artificial intelligence. In a war game or detailed simulation one typically finds multiple decision-making agents, each performing the tasks for which artificial intelligence (AI) is well-suited, such as hypothesis formulation, pattern recognition, planning, scheduling, and resource allocation, performed in an environment full of uncertainty and incomplete, distorted, or disguised information. The decision-makers are gathered together into two or more hierarchies, with information flow inside each hierarchy subject to interpretation and error.

22824 **(ANL/NESC—947) CPDREV; spare parts inventory control system.** Morgenthaler, A.C. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048947.

CPDREV assumes that the inventory item has a predictable sales life, and that the transition costs of passing from one order period to the next consist primarily of the order costs, the inventory carrying costs, and the penalty costs caused by backordering customer requests.

CPDREV was developed to determine proper stock levels for an inventory of process spare parts. The program determines the amount of material to buy, and when it should be bought. CPDREV can compute an implied risk from a prespecified penalty cost, or conversely, the implied penalty cost from a prespecified risk level. The frequency of reordering is computed to provide a basis for distributing the projected workload among buyers and expeditors and to avoid an overstocked inventory. CPDREV is designed to assist maintenance managers in preparing spare parts purchase recommendations.UNIVAC1100;CDC6600,CYBER74,175; FORTRAN (99%) and Assembly language (1%); EXEC8 (UNIVAC1100), SCOPE 3.4.4 (CDC6600,CYBER74), NOS 1.3 (CDC CYBER175); If the programs are segmented, 62,000 words of memory are required to execute the UNIVAC1100 version; the CDC6600 version requires 136,000 (octal) words on a CDC CYBER175.

22825 (CNEN-RT/AMB—(81)2) ALEATO: code for processing numerical data by IBM-370. Dentico, G.; Pacilio, N. (Comitato Nazionale per l'Energia Nucleare, Casaccia (Italy). Dipartimento Reattori Veloci; Comitato Nazionale per l'Energia Nucleare, Casaccia (Italy). Dipartimento Ricerca Tecnologica di Base e Avanzata). Jan 1981. 25p. (In Italian). Dep. NTIS (US Sales Only), MF A01. Order Number DE82903049.

The ALEATO code processes digital data of random nature looking for the distribution of probability that best fit the histogram of experimental data. The choice option for the distributions covers the Bemoulli, Poisson and Polya profiles. The code is self-determining the choice of the fit through an usher that guides and estimates the likelihood.

22826 (PP—60-19) Interim report to the President and the Congress. Kirk, R.J. (Office of Personnel Management, Washington, DC (USA). Office of Compensation Program Development). Sep 1981. 263p. Office of Personnel Management Compensation Group, Office of Compensation Program Development, 1900 E Street, NW, Washington, DC 20415.

The Alternative Work Schedules (AWS) experiment is a three-year evaluation established by the Federal Employees Flexible and Compressed Work Schedules Act of 1978 (Public Law 95-390), which suspended certain provisions of title 5, USC to allow two types of schedules. These are flexible schedules which allow employees to vary arrival times and the length of work days, and compressed schedules which allow the organization to schedule 80 hours in fewer than 10 working days in a two week day period (e.g., 4 to 10 hour days each week, or 5 days one week, and 4 days the next week for a total of 80 hours in a pay period). Public Law 95-390 required the Office of Personnel Management (OPM) to establish an AWS experiment, and to report the findings to the President and Congress. The experiment included more than 1500 experimenting organizations with over 325,000 employees. These experiments cover the entire spectrum of Federal agencies and activities and range from small individual work units of five to ten employees to entire agencies with employees throughout the country such as the General Accounting Office.

9902 Mathematics And Computers

REFER ALSO TO CITATION(S) 19475, 19476, 19790, 20666, 21232, 21480, 21631, 21780, 22073, 22241

22827 (ANL/NESC—364R) SNEQ; nonlinear algebraic equation solutions and curve plotting. Lechliter, G.L. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048364.

In SNAP the maximum number of unknowns is 50. In EQPLT the pseudo-FORTRAN equation is two-dimensional, having an independent variable, a dependent variable, and a parameter. The parameter may assume up to 6 values for any one graph, 100 constant values, and up to 200 values for the independent variables.

SNEQ consists of the two codes, SNAP and EQPLT, which have been merged due to their common use of the SLIP compiler. SNAP interprets and solves pseudo-FORTRAN input equations representing nonlinear algebraic systems. EQPLT interprets pseudo-FORTRAN input equations and calculates and plots multiple curves on a single graph. EQPLT is useful for parameter studies.CDC6600; FORTRAN IV and ASCENT.

22828 (ANL/NESC—386) DATATRAN2; modular programming and data system. Kopp, H.J.; Schilling, W.E. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048386.

DATATRAN2 is a data base management system for a scientific and engineering modular program environment. DATATRAN consists of a set of extensions to the FORTRAN language designed to simplify the development, interconnection and use of large computer programs in a scientific and engineering environment. It allows users to easily connect a series of functional program units (modules) to perform a specific task.CDC6600,7600,CYBER176; FORTRAN (85%), COMPASS (15%); SCOPE 3.1, 3.2, 3.3 or SCOPE 3.4 (CDC6600 Edition B), SCOPE 1.1 (CDC7600 Edition B), and SCOPE 2.1 (CDC7600,CYBER176 Edition C); 64K memory, 2 disks, and permanent storage media such as tapes are required; in addition, CDC6600 usage requires 30K words of ECS and CDC7600 usage 20K words of LCM..

22829 (ANL/NESC—411R) M0661;M0657;M0626; polynomial curve fitting. Shimamoto, T. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048411.

M0661, M0657, and M0626 perform statistical analyses of data based on a least squares polynomial fit.CDC6600; FORTRAN IV; SCOPE 3.1; CDC280 plotter for the graphical output.

22830 (ANL/NESC—428R) DOGGY; desk calculator form sheet DP package. Gazda, S.A. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048428.

Maxima of - 150 columns of input 100 rows per column.

DOGGY can perform most routine form sheet calculations. The program can handle common arithmetic manipulations on columns of input such as addition, subtraction, multiplication, and division. It also has provisions for the use of special functions such as logarithmic, trigonometric, arc trigonometric, hyperbolic, exponential, square root, maxima, minima, and raising a number to any power. DOGGY also calculates water properties such as thermal conductivity, viscosity, and Prandtl Number over a wide range of temperature and pressure.CDC6600; FORTRAN IV and ASCENT.

22831 (ANL/NESC—442R) SIMPLE1; time-sharing programming language. Barrett, M.F. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048442.

SIMPLE1 compiles and executes multistatement calculations typed in a familiar algebraic notation at a time-shared terminal, immediately returning requested results to the terminal and permitting ad lib continuation of a calculation. The user may use the system as an extended and powerful electronic calculator, or as a calculator of small load-and-go runs. Errors are detected and corrected on an as-you-go basis. Calculations may include interactive input/output, functions, and loops.CDC6600; FORTRAN IV and ASCENT; SCOPE.

22832 (ANL/NESC—444R) ROPE; finding roots of a polynomial. Mitchell, N.R. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048444.

ROPE can find roots of polynomials of order up to 99.

ROPE is used to calculate roots of polynomials.CDC6600; FORTRAN IV.

22833 (ANL/NESC—445R) LIZARD4; nonlinear differential equations solution. Dolk, D.R. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048445.

Maximum of - 25 nonlinear first-order differential equations.

LIZARD4 is used to solve nonlinear, ordinary differential equations as a one-shot effort. It was written to solve initial value equations, that is, the values of the dependent variables must be specified at some initial value of the independent variable. One-dimensional steady-state boundary value problems can be solved with LIZARD4, providing an iterative method is employed by the user where one of the boundary conditions is specified and integration proceeds until the alternate boundary condition is met.CDC6600; FORTRAN IV and ASCENT.

22834 (ANL/NESC—446R) MOST; a multidimensional optimization scheme. Lubitz, C.R.; Shanholt, G.A. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048446.

The maximum dimension of the search is 20.

MOST is designed to vary a set of coordinates (x1,x2, . . . ,xn) representing the vector x in such a way that a specified function y(x), y(x) greater than or equal to 0, is minimized.CDC6600; FORTRAN IV.

22835 (ANL/NESC—478) BETTIS ENVIRONMENTAL ROUTINES; MODEL6/3.3;MODEL7/2.0; modified Bettis Environmental Library scope 3.3. Pfeifer, C.J. (Westinghouse Electric Corp., West Mifflin, PA (USA). Bettis Atomic Power Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048478.

The BETTIS ENVIRONMENTAL ROUTINES extend the FORTRAN language by modifying some of the standard CDC6600 library routines and by adding routines to the library to facilitate decimal input and output, file maintenance, scratch I/O, storage allocation, utility functions, operating system interfacing, and operator communication. MODEL (MODified Environmental Library) differs from the original Bettis version in that it allows the operating system, rather than the environmental package, to control the operating environment.CDC6600,7600; FORTRAN IV and ASCENT (Bettis), FORTRAN IV and COMPASS (MODEL 6/3.3, MODEL 7/2.0); SCOPE 2.0 (Bettis), SCOPE 3.3 (MODEL), SCOPE 2.0 (MODEL 7/2.0); For the Bettis version 65,356 words of 60-bit core storage (more or less can be used), a system (6603) disk, at least 2 magnetic tapes, at least 4 non-system disks, each on its own channel, and CDC-280 plotting hardware. For the MODEL versions 65,356 words of 60-bit core storage (more can be used), 2 magnetic tapes, and 4 mass storage devices, each on its own channel.

22836 (ANL/NESC—484) FIGS; IBM360 and 2250 FORTRAN graphics subroutines. Dunford, C.L. (Atomics International Div., Canoga Park, CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048484.

FIGS is a FORTRAN-callable subroutine package for the support of interactive computing programs utilizing an IBM System/360 computer and an IBM2250 display unit.IBM360; FORTRAN IV and BAL; OS/360; IBM360 computer with an attached IBM2250 display unit.

22837 (ANL/NESC—496R) KAPLPLOT; KAPL CalComp plotting routines. Brooking, J. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048496.

KAPLPLOT is the set of standard CalComp subroutines written at Knolls Atomic Power Laboratory to provide graphic output. GRLIN is used to draw an axis system, establish scaling factors, and enable the user to draw linear graphs. GRLOG is used to draw an axis system, establish scaling factors, and permit users to draw full logarithmic graphs. LINLG provides the capability of drawing semi-logarithmic graphs with linearly-scaled abscissas while LOGLN provides the same capability with linearly-scaled ordinates. PENSET initializes the plotting subroutines and draws the job identification, time, date, and charge number. PENEND moves the pen off a completed plot and prevents subsequent plots from overwriting the completed plots. IPLOT moves the plotter pen from its current position to a new position. IDPLOT moves the pen a specified incremental distance in inches from its present position. PSCALE establishes the value of factors to be used by the SPLOT subroutine in scaling user data to fit on plotter coordinates. SPLOT causes the pen to move to coordinates which are obtained by applying PSCALE scale factors to user data. XCPLOT and YCPLOT cause alphabetic information to be written parallel to the direction of the abscissa axis, XCPLOT, or the ordinate axis, YCPLOT. PMARK causes a distinctive symbol to be plotted at the current position of the pen. PLTSIZE conveys to the plotting system information which will enable the plotting system to place the maximum number of plots in a minimum length of paper.CDC6600; FORTRAN IV and ASCENT; SCOPE; GRLIN, LINLG, and LOGLN each require 2000 octal locations.

22838 (ANL/NESC—514) FORSIM; solution of partial or ordinary differential equations. Carver, M.B. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048514.

Maximum of - 1000 ordinary differential equations.

FORSIM is a FORTRAN oriented simulation program which automates the continuous transient solution of systems of ordinary and/or partial differential equations. The user writes his equations in a FORTRAN subroutine, following prescribed rules, and loads this routine along with the executive routines. The executive routines then read in initial data supplied by the user and proceed with the integration.CDC6600; FORTRAN Extended; SCOPE 3.4; 160,000 (octal) memory and 6 disk files, including input and output.

22839 (ANL/NESC—515) GENED ENVIRONMENTAL ROUTINES; subroutine library. Wassem, F.A. (General Electric Co., San Jose, CA (USA). Nuclear Energy Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048515.

The GENED ENVIRONMENTAL ROUTINES consists of a set of standard routines written at the General Electric Nuclear Energy Division and a set of standard GE635 system routines.GE635; FORTRAN IV AND GMAP; GECOS

22840 (ANL/NESC—516) PTAC11; 2-pass assembler for the PDP-11 on 360. Killian, E.W. (EG and G Idaho, Inc., Idaho Falls (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048516.

The number of user defined symbols is limited to 800. The standard DEC mnemonics are used with two exceptions. The alternate mnemonics for BCC (branch if carry clear) and BCS (branch if carry set) are not used. The mnemonic for break trap is called BPT.

PTAC11 allows a programmer to assemble binary code for the Digital Equipment Corporation PDP-11 computer on the IBM360/75, taking advantage of the facilities and speed of the larger machine.IBM360/75; PL/I; OS/360; 100K bytes memory, usual I/O units and one tape unit.

22841 (ANL/NESC—519) **NRTS OS/360 Remote Job Entry; OS/360 MVT remote job entry system.** Richardson, L.C. (EG and G Idaho, Inc., Idaho Falls (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048519.

NRTS allows users at remote locations to submit jobs over slow or high speed communication lines to an IBM system 360/75 using the operating system that provides multiprogramming with a variable number of tasks. This program is an extension of the standard RJE program. Once a job has been entered execution proceeds under OS job management routines.IBM360/75; Assembler; OS/360 MVT Release 19.6; IBM360 with minimum of 512K bytes storage, using OS/360 MVT and an IBM2701 data adapter unit with synchronous data adapter TYPEII with the binary synchronous features, equipped for EBCDIC code and full transparency operation. Dual interface feature is required if line is to be switched between slow and high-speed operation. Direct access storage for RJE tables is typically less than 1-2311 DASD or 1-2314 disk pack. SYSIN data requirements are installation dependent. IBM1130 work station requirements include a single disk storage drive, 8K words of core storage, 1442-7 card read/punch, 1403-2 with RPQ F20724 or 1403-6 printer, binary synchronous communications adapters. Optionally, a 1627-1 plotter, 2415 magnetic tape, 1134 paper tape reader, 1055 paper tape punch, 2501 card reader, and 2250-4 scope are supported.

22842 (ANL/NESC—530) **GENRD; free-format card input processor.** Cox, C.W. (Lawrence Livermore National Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048530.

There is no provision for typing double precision, complex, or logical input. GENRD cannot recognize octal or other nonstandard input forms. Hollerith information cannot be continued from one card to the next nor can it be contained within a repeat specification.

GENRD will read and process free-format numeric and Hollerith input data from cards.CDC6600;IBM360; ANSI Standard FORTRAN; SCOPE 3 (CDC6600) and DOS (IBM360); 3000 decimal words of core, usual I/O, and one tape or disk unit.

22843 (ANL/NESC—541) **WSP-HASP/DOS; DOS-MFT remote workstation package.** McMahon, R.J. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048541.

The WSP (Work Station Package) is a modification of the standard HASP/RMT360 package supplied by IBM and runs on a multiprogrammed DOS System/360/30 using multi-leaving and binary synchronous communications to communicate with a System/360/195/ASP central CPU.IBM360; DOS Assembler language; 360 DOS Release 26.1. The ANL System/360/195 ASP central CPU is operating with Version 2.6.5 of ASP requiring no changes; WSP has been designed for a System/360/30 with an IBM 2540 reader-punch, two IBM 1403 printers, an IBM 1052 printer keyboard console, and an IBM 2701 data adapter unit.

22844 (ANL/NESC—849) **PORTABLE LISP; a list-processing interpreter.** Taylor, W.P. (Lawrence Livermore National Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048849.

The main restriction is the amount of list space used by the program. By changing the statement CONST MAXNODE = 600 to CONST MAXNODE = 2000 a much larger expression can be evaluated. A major feature of LISP, the ability to define and retain function definitions, is not implemented. This is a necessary extension for a useful LISP system.

The program constitutes a complete, basic LISP (LIST-Processing language) interpreter. LISP expressions are evaluated one by one with both the input expression and the resulting evaluated expression printed. Expressions are evaluated until a FIN card is encountered. Between expression evaluations a garbage-collection algorithm is invoked to recover list space used in the previous evaluation.CDC7600; PASCAL; SCOPE; The sample problem was executed in 7000 (octal) words of memory on a CDC7600.

22845 (ANL/NESC—857) **TIDY3;TIDY4; utility to edit fortran source programs.** Jackson, J. (BCS Richland, Inc., WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048857.

Maxima of - 50 different tabular, non-executable statements (TIDY4) 20 characters in a single array name including DIMENSION specifications (TIDY4) 500 distinct statement labels excluding FORMAT statements (TIDY3) 250 distinct FORMAT statement labels (TIDY3) 20 nested DO loops (TIDY3) 19 TYPE statements (TIDY3).

TIDY is a utility program for processing FORTRAN source programs into a standard form which is easy to read and modify. In processing FORTRAN software it renumbers statement labels so that they appear in increasing order, removes statement labels from unreferenced statements and deletes unreferenced FORMAT and CONTINUE statements, indents DO loops and IF levels (IF level by TIDY4 only), and collects and groups TYPE, DATA, and EQUIVALENCE statements (TIDY3 collects only TYPE statements). Each group is alphabetized and rewritten in a column-aligned manner. FORMAT statements are, optionally, either inserted following the first reference or optionally collected at the end of the code. Blanks are inserted and removed to improve readability.CDC CYBER74,175;UNIVAC1100; FORTRAN IV (TIDY3), FORTRAN ASCII (98%), Meta-Assembler (1%), and Assembler (1%) (TIDY4); SCOPE 3.4 (CDC CYBER74), NOS 1.3 (CDC CYBER175), EXEC8 (UNIVAC1100); Four mass-storage units are used for storage. 30K words of memory are required for TIDY4 execution. TIDY3 requires 46,000 (octal) words of memory.

22846 (ANL/NESC—860) **PDFPLOT; statistical distribution functions.** Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Atwood, C.L. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048860.

PDFPLOT produces plots of different types of estimated probability density functions and cumulative distribution functions. Optional output includes a listing of the cumulative probabilities.CDC CYBER76;CDC7600; FORTRAN IV (88%) and COMPASS (12%); SCOPE 2.1; 45,000 (octal) words of memory are needed to execute the program.

22847 (ANL/NESC—864) **UPD; source deck maintenance utility routine.** Perry, G.W.; Medlin, T.W. (Tennessee Valley Authority, Chattanooga (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048864.

UPD can handle any kind of 80-column source cards provided columns 73-80 are available for use as a sequence field. A deck is defined as a series of cards that have the same four characters in columns 73-76, while a sequence number occupies columns 77-80 of each source card within the deck. Typically, there is one deck for each subprogram, and the deck name is either the subprogram name or a derivative of it. Blanks may appear in the deck name only on the right, and only digits are allowed in columns 77-80. UPD, however, can also operate on source decks that do not have any sequence numbers in columns 77-80.

UPD is a source card maintenance program which enables the user to make many changes to an existing source deck stored on tape or disk while keeping a simple, accurate record of those changes, which include inserting, deleting, or replacing cards in the existing source deck.IBM360,370,303x;Amdahl470; FORTRAN IV (64%) and BAL (36%); OS/360; 150K bytes of memory, standard input and output units (logical units 5 and 6) and direct access units for the old master file (logical unit 4), the auxiliary file (logical unit 7), the new master file (logical unit 8), and a temporary file (logical unit 99) as required for execution.

22848 (ANL/NESC—866) INTEROP; nonlinear optimization algorithms. Rasmuson, D.M.; Thurgood, R.L. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048866.

The program is dimensioned for a maximum of 20 parameters and 20 states.

The INTERactive OPtimization system (INTEROP) is a collection of search direction algorithms for constrained and unconstrained nonlinear optimization problems. The search direction algorithms available in INTEROP include: modified Fletcher-Powell, modified Fletcher-Reeves, steepest-descent Newton, homogeneous predictor, and modified Powell.CDC CYBER173;CDC6600,7600; FORTRAN IV (90%) and COMPASS (10%); SCOPE 3.4.4 (CDC6600), SCOPE 2.1.3 (CDC7600); INTEROP requires approximately 130K (octal) words for execution on a CDC6600 and 76K (octal) words on a CDC7600.

22849 (ANL/NESC—867) PAMA; preferred acquisition method analysis. Jones, R.G. (Sandia National Labs., Albuquerque, NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048867.

Deviation from the standard cost elements or other special situations must be processed as hand-entered adjustments. Adjustments cannot be made to lease payments.

PAMA is an interactive COBOL program which through an inquiry procedure calculates the preferred method of acquisition of ADP equipment. The Preferred Acquisition Method Analysis leads to a lease, lease with conversion to purchase, or lease to ownership (or deferred purchase) versus purchase analysis. This methodology is intended to be applied to small procurements under $400,000 and to sole source procurements over $400,000, and can provide budget-supporting justification for all procurements. For the larger competitive procurements, a purchase versus lease methodology based on monthly life cycle analysis is preferred.CDC6600; COBOL; NOS and SCOPE 3.4.4; 66,000 (octal) words of memory are required for PAMA.

22850 (ANL/NESC—872) CATCH; map projection subroutine package. Tucker, T.C.; Campbell, L.J. (Union Carbide Corp., Oak Ridge, TN (USA). Computer Sciences Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048872.

The Clarke 1866 spheroid is assumed but a subroutine is included to simplify changing to any other ellipsoid.

CATCH (Computer-Assisted Topography, Cartography, and Hypsography) is a compatible and extensible collection of subroutines to perform a number of common map projection calculations. Included in the collection are the Albers equal area, the Lambert conformal, the Universal Transverse Mercator, the U.S. Polyconic, and the various state plane coordinate systems. Optional higher-level subroutines having the projection name as one parameter, are provided to call the projection subroutines. This facilitates use of the projection subroutines in applications programs. A general subroutine for bilinear transformation of one quadrilateral to another was developed for translating, rotating, and scaling the plane coordinates and can be used for very large-scale, approximate projections.IBM360,370,303x; FORTRAN IV; OS/370; 152K bytes of storage are required for execution.

22851 (ANL/NESC—879) SAMPLE; Monte Carlo uncertainty analysis code. Goldberg, F.F. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048879.

The program permits normal, log-normal, and log-uniform distribution types to be specified for the input variables, and all of the input variables must have the same distribution type. Other distribution types and changes allowing each variable to have any of the distribution types could easily to added.

The SAMPLE program uses Monte Carlo simulation to compute the mean, standard deviation, probability range, and distribution for the function $y=f(x(1), x(2), . .x(k))$ given that the distributions of x(1), x(2), ..x(k) are known and the functional dependence of y on the x's is known.IBM360,370,303x; FORTRAN IV; OS/360,370; 140K bytes were required to execute the sample problem.

22852 (ANL/NESC—881) ELEFUNT; tests of Fortran elementary functions. Cody, W.J. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048881.

The package contains one subroutine (MACHAR) for dynamic determination of parameters describing the floating-point arithmetic system of the host machine. Should this hardware-sensitive subprogram malfunction, the test programs must be modified to insert the necessary machine-dependent parameters in DATA statements, or otherwise make them available. This computing environment inquiry routine is known to malfunction when the arithmetic registers are wider than the storage registers.

ELEFUNT is a FORTRAN test package for the elementary functions. Each program is an aggressive test of one or more of the elementary function subroutines generally supplied with the support library accompanying a FORTRAN compiler. Functions tested are ALOG/ALOG10, ASIN/ACOS, ATAN, EXP, POWER, SIN/COS, SINH/COSH, SQRT, TAN/COTAN, and TANH.IBM360,370,303x;CDC6600,7600; UNIVAC1108,1100; FORTRAN; OS/370 (IBM3033), SCOPE 3.4.4 (CDC6600), SCOPE 2.1.5 (CDC7600), and EXEC8 (UNIVAC1100); The maximum space required by any one test driver is 50K bytes on an IBM3033, 16,000 (octal) words on a CDC6600, 5700 (octal) words on a CDC7600, and 3600 words on a UNIVAC1100/44.

22853 (ANL/NESC—882) GSMP; general systems analysis modeling code. Cook, J.M. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048882.

The General System Modeling Program (GSMP) is designed for use by systems analysis teams. Though developed primarily for the modeling of advanced energy conversion systems, it is designed to model any object satisfying the most general definition of the word 'system'. Given compiled subroutines that model the behavior of components plus instructions as to how they are to be interconnected, GSMP links them together to model a complete system. Standard system-analytic services are provided: parameter sweeps, graphics, free-form input and formatted output, file storage and retrieval, error diagnostics, component model and integration checkout facilities, sensitivity analysis, and an optimizer with nonlinear constraint capability. Steady-state or cyclic time-dependence is simulated directly, initial-value problems only indirectly.IBM370,303x; PL/I (90%), FORTRAN IV (9%), and Assembly language (1%); OS/370; If the system optimization capability is invoked, storage requirements vary from approximately 0.5 to 1 megabyte or more depending on the size of the system model.

22854 (ANL/NESC—884) VUGRAPH; plots presentation-quality viewgraphs. Knox, R.J. (Lawrence Livermore National Lab., CA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048884.

Horizontal plots normally are contained within a 7.5 inch wide x 6.25 inch high rectangle, with optional expansion to 9 inches x 7 inches. Vertical plots are contained within a 7 inch wide x 9 inch high rectangle. Text lines in a choice of four colors may be oriented horizontally or vertically. Character size and aspect ratio are continuously variable. Type styles include italics and some other modifications of the minicomputer's basic character set.

VuGRAPH offers a convenient means of generating professional quality four-color viewgraph transparencies (or small posters) in a variety of character sizes and styles using the HP9825A minicomputer with the HP9872A plotter system.HP9825A; HPL; An HP9825S system, consisting of an HP9825A desktop computer with 23K bytes of memory, and equipped with both the String-Advanced Programming ROM and the Plotter-General I/O ROM and an HP9827A plotter are required.

22855 (ANL/NESC—888) MINPACK1; nonlinear equations & least squares. Garbow, B.S. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048888.

MINPACK1 is a package of FORTRAN subprograms for the numerical solution of systems of nonlinear equations and nonlinear least squares problems. The individual subprograms are: IDENTIFICATION DESCRIPTION CHKDER Check gradients for consistency with functions DOGLEG Determine combination of Gauss-Newton and gradient directions DPMPAR Provide double precision machine parameters ENORM Calculate Euclidean norm of vector FDJAC1 Calculate difference approximation to Jacobian (nonlinear equations) FDJAC2 Calculate difference approximation to Jacobian (least squares) HYBRD Solve system of nonlinear equations (approximate Jacobian) HYBRD1 Easy-to-use driver for HYBRD HYBRJ Solve system of nonlinear equations (analytic Jacobian) HYBRJ1 Easy-to-use driver for HYBRJ LMDER Solve nonlinear least squares problem (analytic Jacobian) LMDER1 Easy-to-use driver for LMDER LMDIF Solve nonlinear least squares problem (approximate Jacobian) LMDIF1 Easy-to-use driver for LMDIF LMPAR Determine Levenberg-Marquardt parameter LMSTR Solve nonlinear least squares problem (analytic Jacobian, storage conserving) LMSTR1 Easy-to-use driver for LMSTR QFORM Accumulate orthogonal matrix from QR factorization QRFAC Compute QR factorization of rectangular matrix QRSOLV Complete solution of least squares problem RWUPDT Update QR factorization after row addition R1MPYQ Apply orthogonal transformations from QR factorization R1UPDT Update QR factorization after rank-1 addition SPMPAR Provide single precision machine parametersIBM360,370 (designed to be machine-independent); FORTRAN IV; OS/360 (IBM360), OS/370 (IBM370); The test executions require from 92K to 158K bytes of storage.

22856 (ANL/NESC—896) TIDY-J; Fortran source code editing processor. Hightower, W.H. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048896.

Maxima of - 19 continuation cards 1000 unique statement numbers per subprogram.

TIDY-J is a utility program for processing FORTRAN source programs into a standard form which is easy to read and modify. In processing FORTRAN source statements it left-justifies statement labels and renumbers them to appear in increasing order, removes statement labels from unreferenced statements, deletes unreferenced FORMAT and unnumbered CONTINUE statements, deletes consecutive blank comment cards in excess of two, and inserts identification in columns 73-79. All statements, including comments, are aligned to begin in column 7. FORMAT statements are either collected at the end of the code, or optionally, left where they appear. Blank characters are inserted in statements and removed from them to improve readability. TIDY-J also provides a limited set of FORTRAN diagnostics on such errors as missing or duplicate statement numbers, asymmetric parentheses count, illegal DO-loop indexing, illegal statements, and inaccessible parts of the program. If the program contains a reference to non-existent statement numbers, TIDY-J generates pseudo statement numbers to replace these numbers in the referencing statements.IBM360,370,303x; FORTRAN IV; OS/MVT or OS/MVS; Two mass storage devices, logical units 8 and 9, are used for temporary storage. New "TIDYed" decks are punched on cards (logical unit 7). 150K bytes of memory are required for TIDY-J execution.

22857 (ANL/NESC—897) PL-MOD; fault tree analysis by modularization. Olmos, J.; Wolf, L. (Massachusetts Inst. of Tech., Cambridge (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048897.

PL-MOD is limited to steady-state occurrence probabilities. Only replicated gates representing a supercomponent event independent from all other gates in the tree may be treated.

PL-MOD performs an analysis of operating systems modeled by means of fault trees using modularization techniques. The program was developed to perform the modularization and evaluation of the modular occurrence probabilities and Vesely-Fussell importance measures for analysis of nuclear reactor safety system fault trees efficiently. It is capable of modularizing fault trees containing replicated components and replicated modular gates and can handle mutually exclusive inputs and explicit higher order symmetric (k-out-of-n) gates.IBM370,303x; PL/I; OS/VS1 (IBM370/168) and OS/MVT (IBM3033); 200K bytes of memory are required for execution.

22858 (ANL/NESC—905) GWCORE; GSPC 79 core graphics routines package. Wenner, P. (George Washington Univ., Washington, DC (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048905.

This package of FORTRAN callable subroutines is an implementation of the 1979 ACM SIGGRAPH core graphics specification. It is a machine-independent, device-independent output only (at this time) graphics language. It provides the primitives - lines, markers, polylines, polymarkers, polygons, moves, and text, as well as segmentation capabilities which permit many control functions such as visibility, highlighting, new frames, detectability, and image transformation. virtual size of application programs written with GWCORE is one-half million bytes. Integer*4 and real variables are also used so the system is not directly usable on 16-bit machines.

22859 (ANL/NESC—909) FC;LSEI;WNNLS; constrained least squares fit. Hanson, R.J. (Sandia National Labs., Albuquerque, NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048909.

Source decks (FC,LSEI,WNNLS 5572 cards, BLAS 726 cards) Sample driver (537 cards) Reference reports, SAND78-1290, SAND78-1291, and NESC Note.

FC allows a user to fit discrete data, in a weighted least-squares sense, using piece-wise polynomial functions represented by B-splines on a given set of knots. In addition to the least-squares fitting of the data, equality, inequality, and periodic constraints at a discrete, user-specified set of points can be imposed on the fitted curve or its derivatives. The subprograms LSEI and WNNLS solve the linearly-constrained least-squares problem. LSEI solves the class of problem with general inequality constraints, and, if requested, obtains a covariance matrix of the solution parameters. WNNLS solves the class of problem with nonnegativity constraints. It is anticipated that most users will find LSEI suitable for their needs; however, users with inequalities that are single bounds on variables may wish to use WNNLS.CDC6600,7600,CYBER175 (designed to be machine-independent); FORTRAN IV; NOS 1.4 (CDC6600), SCOPE 2.1 (CDC7600), NOS 1.3 (CDC CYBER175); 37,000 (octal) words of storage are needed to execute the sample driver that is provided. The storage required is a linear function of the number of data points plus a quadratic function of the number of piecewise polynomial coefficients. The code is edited output produced by the FORTRAN preprocessor, FLECS.

22860 (ANL/NESC—910) GRAIL; a device-independent graphics language. Brooking, J.A.; Schaller, N. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048910.

GRAIL is designed to be a graphical, device-independent, picture description system. GRAIL was designed to alleviate the software maintenance burden imposed by having several types of devices capable of generating graphical output under the control of applications programs. GRAIL is used through FORTRAN subroutine calls to describe a picture or set of pictures. These calls generate a GRAIL file which, when interpreted by post-processor programs, will generate pictures on any graphics device the user chooses.CDC6600,7600; FORTRAN IV (81%) and COMPASS (19%); NOS/BE 1.3 and SCOPE 3.2 (CDC6600), SCOPE 1.1 (CDC7600); The two GRAIL test programs require approximately 22,700 (octal) words for execution. The post-processor program, GRACAL, executes in approximately 30,100 (octal) words of central memory. GRAIL has been used in conjunction with CalComp, CDC280 COM, Versatec, and GOULD plotting devices.

22861 (ANL/NESC—912) MOCARS; mc distribution & simulation limits. Matthews, S.D.; Poloski, J.P. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048912.

Maxima of - 20 quantile values When calculating component importance, sampling distributions are assumed to be normal, lognormal, or exponential.

MOCARS uses Monte Carlo techniques to determine the distribution and simulation limits for a function. MOCARS randomly samples data from any of 12 different probability distributions and either evaluates a user-specified function or cut set system unavailability using the sample data. After ordering the data, the values at various quantities and associated confidence bounds are calculated. The available distributions are uniform, exponential, normal, binomial, Poisson, lognormal, Weibull, gamma, beta, Cauchy, Pearson Type IV, and empirical. If the cut set unavailability function is evaluated, MOCARS can determine the importance ranking for components in the unavailability calculation. Frequency and cumulative distribution histograms are also calculated from the sample data.CDC CYBER76;CDC7600; FORTRAN IV (76%) and COMPASS (24%); SCOPE 2.1; If a segmented load is performed, 15,000 (octal) words of memory are required for execution. Without segment loading additional memory will be needed.

22862 (ANL/NESC—913) LPMGB; linear programming subroutine with bounds. Hanson, R.J. (Sandia National Labs., Albuquerque, NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048913.

If the problem has M constraint equations in N variables, the extra storage, excluding data, is a linear function of M and N+(M*M) memory locations.

LPMGB minimizes a linear function of several variables subject to linear equality constraints with bounds on selected variables.CDC7600,CYBER175;IBM370,303x; FORTRAN; OS/370 (IBM370), SCOPE 2.1 (CDC7600), NOS 1.3 (CDC CYBER175); 27,000 (octal) words of memory are needed to execute the CDC7600 version with the test driver that is provided; the IBM370 version requires 120K bytes of memory.

22863 (ANL/NESC—916) UT200; DEC emulation of CDC 200 user terminal. Crow, V. (Pacific Northwest Lab., Richland, WA (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048916.

The UT200 program enables a properly configured DEC PDP-11 to be used as a remote job entry (RJE) terminal with CDC data processing equipment.DEC PDP-11; PAL PDP-11 assembly language; CAPS-11; 10K words of memory and the following input/output devices are needed: VT05, VT50, or VT52 CRT terminal, LP-11 line printer, CR-11 card reader, and DP-11 synchronous line interface. In addition, a TA-11 cassette unit, or alternative device, must be available to assemble and load the program.

22864 (ANL/NESC—918) LASO; block lanczos symmetric eigenvalue code. Scott, D.S. (Union Carbide Corp., Oak Ridge, TN (USA). Nuclear Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048918.

LASO is a package of subroutines developed for solving large sparse symmetric eigenvalue problems. There are two driver subroutines, one to determine a fixed number of eigenvalues and eigenvectors at one end of the spectrum of a large sparse symmetric matrix and the other to determine all the eigenvalues and eigenvectors of a large sparse symmetric matrix outside a user-defined excluded interval. Both are available in both single and double precision applicable to short word-length (32-bit) and longer word-length hardware.IBM360,370,303x (designed to be machine-independent); FORTRAN IV; OS/370 MVT and MVS; 500K bytes of memory are needed for compilation and 180K bytes are used for the double precision execution of the sample problem.

22865 (ANL/NESC—922) VMCON; nonlinearly constrained optimization. Hillstrom, K.E.; Minkoff, M. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048922.

VMCON minimizes a nonlinear function subject to nonlinear equality and inequality constraints.IBM370,303x; FORTRAN IV; OS/370; 95K bytes of memory are required to execute VMCON with the sample problems provided.

22866 (ANL/NESC—929) QLEVEL; potential bound & quasibound levels. Le Roy, R.J. (Waterloo Univ., Ontario (Canada)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048929.

Maxima of - 6010 mesh points 210 turning points 200 levels at which a solution is desired The potential used must be smooth or care must be taken at points where it has discontinuous derivatives.

QLEVEL solves the radial or one-dimensional Schroedinger equation for any given (smooth) potential to determine its eigenvalues, eigenfunctions, and the expectation values of various operators for any bound or quasibound levels (orbiting or shape resonances) of the given potential. The program can automatically generate the whole manifold of vibrational and rotational levels of a potential from a single initial trial eigenvalue, and can generate and use any one of a wide variety of analytic potentials or use a numerical potential defined by a set of user-supplied points.IBM370,303x; FORTRAN IV; OS/370; 350K bytes of memory are required to execute the program.

22867 (ANL/NESC—935) IDAP; interactive decision analysis procedure. Jusko, M.J.; Whitfield, R.G. (Argonne National Lab., IL (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048935.

The number of nodes in the user's decision tree is limited by the size of the main memory available. One node uses 94 bytes plus 4 bytes per attribute; a 1024-node 3-attribute tree requires an additional 106K bytes.

IDAP (Interactive Decision Analysis Procedure) is a program for creating, manipulating, and evaluating decision trees, which are representations of decision problems characterized by uncertain outcomes and multiple conflicting objectives. Capabilities of the program include: handling multiple decision nodes, including sequential decisions; handling discrete probability nodes with the number of branches virtually unlimited, so that a continuous probability function can be closely approximated; handling many attributes; accepting a wide variety of functional forms for marginal utility functions, including both discrete and continuous forms; treating multiattribute utility functions of either the additive or multiplicative form; calculating the expected utility for each decision alternative; identifying the optimal alternative, i.e. that which maximizes the expected utility; and performing sensitivity analyses by changing utility function parameters or attribute level tolls for nodes.IBM360,370,303x; PL/I; IBM OS/370 or IBM VM/370 under CMS; The program requires approximately 350K bytes of memory.

22868 (ANL/NESC—936) LCURVE; learning curve production calculations. Hatcher, B.L. (General Electric Co., St. Petersburg, FL (USA). Neutron Devices Dept.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048936.

LCURVE is a BASIC time-sharing computer program written to estimate the effort or dollars required to perform a task in a manufacturing process. The learning curve theory is that as quantities double, the rate of learning remains the same. For a 90 percent learning curve this means the second unit requires 90 percent of the hours needed to build the first unit, and the fourth unit requires 90 percent of the average hours needed to build the first two units. The percent learning curve to be used for the manufacturing process must be selected with care. If historical data are available, least squares analysis can be applied to determine the actual learning curve for a particular product and organization.Honeywell Series 60 Level 66 Model 20; BASIC; GCOS (Honeywell66/20), RT-11 (DEC LSI-11).

22869 (ANL/NESC—939) MAPPER; report-quality graphics on command. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; Penny, S.K. (Union Carbide Corp., Oak Ridge, TN (USA). Computer Sciences Div.). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048939.

Three-dimensional surfaces and mapping data bases are not included.

MAPPER is designed to provide a command language whereby non-programmers can produce report quality visual aids. The user can produce presentation and report quality slides, graphs, charts, tables, and maps in both color and black and white on 35mm film, Tektronix terminals, and Versatec and CalComp plotters. MAPPER can also be used to make 35mm and 16mm color or black and white movies. MAPPER can draw boxes, circles, ellipses, and complex line segments in a wide variety of line formats. There are six types of label commands and twelve lettering styles available to meet labeling requirements. Label options include manual sizing and location, two forms of automatic sizing and location, flexible string control, rotation, justification control, and multiple line capability. The user has a choice of color control and selective shading of specific areas. Symbols may be defined, positioned, scaled, distorted, and shaded as specified. Axes, curves, and error bars may be drawn. Additional features include user-defined logos, skipping, multilevel projection ports, contouring, three types of file subroutine usage, movie generating commands, and FORTRAN support capabilities.IBM360,370;DEC10; FORTRAN IV; OS/MVS (IBM360,370), TOPS 10 (DEC10); DISSPLA software is required along with appropriate film, plotter, and graphics input devices (e.g. CalComp 1036 and 1055 plotters, Versatec and Gould 5005 plotters, FR-80 film recorder, and Tektronix 4010-compatible terminals and Graphics Tablet), and 470K bytes of storage (IBM360,370) or 178 plus 15 pages of virtual memory (DEC10).

22870 (ANL/NESC—946) FLOCHT; computer drawn flow charts & diagrams. Fischer, S.K. (Oak Ridge National Lab., TN (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048946.

Both programs accept a maximum of 69 different instructions. .

FLOCHT is a combination of a DEC PDP10 computer program, FLOW1, and an IBM360 program, FLOW2, designed to produce publication quality flow charts and diagrams from a rough draft. Use of FLOCHT requires a minimum knowledge of the computer systems.DEC PDP10 with IBM360,370 or 303x; FORTRAN IV (99%), Assembly language (1%); OS/360 (FLOW2), TOPS-10 (FLOW1); 400K bytes of memory are required to execute the FLOW2 program.

22871 (CNEN-RT/EDP—82-1) Management and control of the IBM 370-168 system with the AG02 system. Litido, M.; Maioli, C.; Zini, C. (Comitato Nazionale per l'Energia Nucleare, Rome (Italy)). 1982. 72p. (In Italian). NTIS (US Sales Only). Order Number DE83900857.

A description is given of the characteristics and workload of the aforementioned computer center as well as an analysis of the components and function of the AG02 system. A tabular evaluation of the system's operation is given for the period May 18-June 5, 1981 at the Computer Center of the Italian National Nuclear Energy Commission. 8 references, 1 figure, 1 table.

22872 (CONF-820322—3) Computer program abstract as software documentation. Butler, M.K. (Argonne National Lab., IL (USA)). 1982. Contract W-31-109-ENG-38. 6p. NTIS, PC A02/MF A01. Order Number DE83007570.

From Federal information processing standards software documentation workshop; Washington, DC, USA (3 Mar 1982).

The computer program abstract, while not universally accepted as a form of software documentation, has long been recognized as a necessary reference document by the computer user community. Users have banded together in cooperative organizations with like computing environments, common disciplines, or a shared need for particular applications software, to promote the use of computer program abstracts as a means of publication, program exchange, and software development cost savings. Compilations of program abstracts have been adopted to describe the contents of computer program libraries and to market the software industry's products. In 1981, publication of an American National Standard for Computer Program Abstracts was approved, lending an air of respectability to the abstract's claim to a place in the software documentation family. This paper first seeks to define a computer program abstract and to point out its distinguishing features. Then, users and proponents of computer program abstracts are identified, and prior standardization efforts are reviewed, followed by a discussion of the development of the American National Standard.

22873 (CONF-820825—2) ANSI standard PL/I: an update. Dritz, K.W. (Argonne National Lab., IL (USA)). Aug 1982. Contract W-31-109-ENG-38. 27p. NTIS, PC A03/MF A01. Order Number DE83007962.

From SHARE 59 meeting; New Orleans, LA, USA (22 Aug 1982).

Activities, past and present, connected with the standardization of PL/I are surveyed in this talk. Noting implementations of full ANS PL/I (X3.53 to 1976), we begin with a review of the most significant differences between it and IBM PL/I. Some features and implementations of ANS General Purpose Subset PL/I (X3.74 to 1981) are covered next, and we also look briefly at the proposed extensions for real-time applications. Present activities of ANSC X3J1 towards revising full ANS PL/I are the final topic. Highlighted are features originating in the SHARE PL/I Project as well as proposals stemming from the author's own special interest, i.e., extensions to enhance the portability of mathematical software written in PL/I. The talk is an elaboration of numerous points presented on viewgraphs. The viewgraphs are reproduced here without benefit of elaboration; they are more or less self-explanatory.

22874 **(EUR—8034-EN) Documentation for the QMC generic LP modelling system. Final report.** Slee, P.V.; Williams, P.C. (Queen Mary Coll. Industrial Research Ltd., London (UK)). 1982. 176p. European Community Information Service, 2100 M Street, NW, Suite 707, Washington, DC 20037.

The documentation consists of five manuals: The BUILDER reference manual provides a general introduction to the system by means of descriptions and explanation of all available generic model building facilities. The Descriptive Manual provides a complete guide to the preparation of input data for BUILDER. The PRINTER Manual describes in detail the features of the PRINTER programs. The Computer System Use Manual gives advice on the compilation and execution of the Generic software. The Error Recovery Manual provides assistance in the interpretation of error messages produced by the system. Each manual consists of an introduction followed by a series of sections arranged in alphabetical order of subject. Where sections are common to more than one manual there is appropriate cross-referencing.

22875 **(LBL—15552) Max-IV disc cache.** Jacobson, V. (Lawrence Berkeley Lab., CA (USA)). Oct 1982. Contract AC03-76SF00098. 19p. NTIS, PC A02/MF A01. Order Number DE83008297.

This note describes some design considerations for routines to cache sectors of disc in main memory on a Modcomp-IV or Classic running Max-IV. Anyone who has used the Tools under Max-IV or has a real time system which does a lot of disc I/O (like the NBS system) is aware of the pathetic disc performance. The CPU utilization, even with 5 or 6 users, rarely exceeds 30% (limited by disc saturation). The idea of a cache is to use memory & CPU cycles to reduce the number of disc seeks.

22876 **(PB—82-217597) EFOM 12C software: general overview. Final report.** Jadot, P.; Fuchsova, J.; Vankelecom, E.; Van der Voort, E.; Thonet, C. (Commission of the European Communities, Luxembourg). 1981. 131p. (EUR—7391-EN). NTIS PC E06/MF E06.

The EFOM EC-12C software is described, produced by Systems-Europe during the first program of the CEC on energy modelling. This includes DAMOCLES, a specific data-base management system; SIMUL, a simulation program whose prime function is to check data consistency and issue warning messages when inconsistencies occur; and ORESTE-EDISON, a linear program matrix generator and report writer. The energy model, and the method of representing the energy system are briefly described. Appendix A defines the parameters needed to perform the case studies using the EFOM 12C software.

22877 **(SAND—83-0269C) DOBIS multiple data base support as implemented at Sandia National Laboratories Technical Library.** Kurtz, S.; Jones, D.T. (Sandia National Labs., Albuquerque, NM (USA); New Mexico Univ., Albuquerque (USA). Computing Center). 1983. Contract AC04-76DP00789. 90p. (CONF-830207—1). NTIS, PC A05/MF A01. Order Number DE83006206.

From DOBIS/LIBIS library system conference; Paris, France (17 Feb 1983).

Sandia National Laboratories leased the DOBIS-LIBIS library software from IBM in 1982 to provide computerized library services for the Sandia Albuquerque and Livermore Technical Librariies. Sandia made modifications to the software to expand the system's capabilities to allow use of multiple data files running under a single communication system. The enhancements have allowed Sandia to segretate their classified data from unclassified data and to restrict access to the classified data. The modifications have applicability for other users of the DOBIS sofrtware concerned with preserving the integrity of their private or classified information.

22878 **(UCID—19563-8) Electronics Engineering Department Computer Program Newsletter No. 8: image-processing computer codes.** Twogood, R.E.; Portnoff, M.R.; Sherwood, R.J. (Lawrence Livermore National Lab., CA (USA)). 3 Jan 1983. Contract W-7405-ENG-48. 40p. NTIS, PC A03/MF A01. Order Number DE83007768.

This newsletter presents an overview of the image processing computer capabilities that are available in the Electronics Engineering Department at LLNL. The computer programs discussed cover a wide range of operations, from simple image file formatting and manipulation to sophisticated image enhancement, 2-D transforms, and image filtering operations. This series of Computer Program Newsletters is published to inform the LLNL research community of the various software capabilities available in the Electronics Engineering Department.

22879 **(Y/DJ—25-016) Interactive control charts using SAS82.** Schlotzhauer, D.C. (Oak Ridge Y-12 Plant, TN (USA)). Jan 1983. Contract W-7405-ENG-26. 19p. (CONF-830125—1). NTIS, PC A02/MF A01. Order Number DE83007088.

From SAS users group international conference; New Orleans, LA, USA (16 Jan 1983).

American industry is under pressure to produce quality products. Statistical techniques, especially control charts, are becoming recognized as vital tools to this end, and the computer has greatly simplified their implementation by freeing people from the computations involved. This paper presents a program using SAS 82.1 and SAS/GRAPH making it possible to create x-bar and range charts in an interactive mode. In response to a series of prompts, the user provides information and makes various selections which tailor the resulting plot to his needs. For example, new control limits may be calculated at any point. Listed on the plot are runs-test statistics and out-of-limits points giving a complete analysis of the process on a single page. Also, since the new macro language is extensively used, the program serves as an example of its usefulness in SAS programming. Examples from the nuclear weapons industry will illustrate use of the program. Charts were established to help control the composition of material used in the manufacture of parts for these weapons.

22880 **Latin square three dimensional gage master.** Jones, L.L. (to Dept. of Energy). US Patent 4,364,182. 21 Dec 1982. Filed date 12 May 1981. vp.

PAT-APPL-262846.

A gage master for coordinate measuring machines has an nxn array of objects distributed in the Z coordinate utilizing the concept of a latin square experimental design. Using analysis of variance techniques, the invention may be used to identify sources of error in machine geometry and quantify machine accuracy.

22881 **Newton's method with a model trust region modification.** Sorensen, D.C. (Argonne National Lab., IL). *SIAM (Society for Industrial and Applied Mathematics) Journal on Numerical Analysis;* **19**: No. 2, 409-426(Apr 1982). Contract W-31-109-ENG-38.

A modified Newton method for unconstrained minimization is presented and analysed. The modification is based upon the model trust region approach. This report contains a thorough analysis of the locally constrained quadratic minimizations that arise as subproblems in the modified Newton iteration. Several promising alternatives are presented for solving these subproblems in ways that overcome certain theoretical difficulties exposed by this analysis. Very strong convergence results are presented concerning the minimization algorithm. In particular, the explicit use of second order information is justified by demonstrating that the iterates converge to a point which satisfies the second order necessary conditions for minimization. With the exception of very pathological cases this occurs whenever the algorithm is applied to problems with continuous second partial derivatives.

22882 **A_0-stable formulas of Adams type.** Feinberg, R.B. (Iowa State Univ., Ames). *SIAM (Society for Industrial and Applied Mathematics) Journal on Numerical Analysis;* **19**: No. 2, 259-262(Apr 1982).

This paper is concerned with the stability and accuracy of linear multistep formulas of Adams type. It is shown in particular that there are A_0-stable and k-step formulas of order k only for $k \leq 4$.

22883 Splines under tension for gridding three-dimensional data. Brand, H.R.; Frazer, J.W. (Lawrence Livermore National Lab., CA). *Analytical Chemistry;* **54**: No. 3, 414-416(Mar 1982). Contract W-7405-ENG-48.

By use of the splines-under-tension concept, a simple algorithm has been developed for the three-dimensional representation of nonuniformly spaced data. The representations provide useful information to the experimentalist when he is attempting to understand the results obtained in a self-adaptive experiment. The shortcomings of the algorithm are discussed as well as the advantages.

22884 (BG-Trans—5777) Description of criteria and testing methods for the hardware and software of microcomputer systems in applications relating to the safeguarding of systems in accordance with safety regulations. (British Gas Corp., London). Mar 1982. Translation source information not available . 16p. Dep. NTIS (US Sales Only), MF A01.

In technical safety relevant applications, microcomputer systems have to be designed so as to ensure the same degree of safety and reliability as is achieved by conventional engineering means. For this condition to be met, it is necessary to equip hardware and software parts of systems and equipment with verifiable self-testing routines and external testing equipment. Some of these methods are discussed. (GHT)

22885 VAL language: description and analysis. McGraw, J.R. (Lawrence Livermore National Lab., CA). *ACM Trans. Prog. Lang. Syst.;* **4**: No. 1, 44-82(Jan 1982). Contract W-7405-ENG-48.

VAL is a high-level, function-based language designed for use on data flow computers. A data flow computer has many small processors organized to cooperate in the executive of a single computation. A computation is represented by its data flow graph; each operator in a graph is scheduled for execution on one of the processors after all of its operands' values are known. VAL promotes the indentification of concurrency in algorithms and simplifies the mapping into data graphs. This paper presents a detailed introduction to VAL and analyzes its usefulness for programming in a highly concurrent environment. VAL provides implicit concurrency (operations that can execute simultaneously are evident without the need for any explicit language notation). The language uses function- and expression-based features that prohibit all side effects, which simplifies translation to graphs. The salient language features are described and illustrated through examples taken from a complete VAL program for adaptive quadrature. Analysis of the language shows that VAL meets the critical needs for a data flow environment. The language encourages programmers to think in terms of general concurrency, enhances readability (due to the absence of side effects), and possesses a structure amenable to verification techniques. However, VAL is still evolving. The language definition needs refining, and more support tools for programmer use need to be developed. Also, some new kinds of optimization problems should be addressed.

22886 Period doubling for trapezoid function iteration: metric theory. Beyer, W.A.; Stein, P.R. (Los Alamos National Lab., NM). *Adv. Appl. Math.;* **3**: 1-17(1982).

Iterations of a one-parameter family $F(\lambda,x) = \lambda f(x)$ of endomorphisms of [0,2] having the form of a trapezoid $f(x) = x/e$ for x belongs to [0,e], $f(x) = 1$ for x belongs to (e,2 - e) and $f(x) = (2 - x)/e$ for x belongs to [2 - e,2], are investigated. Here λ belongs to [1,2] and e belongs to (0,1). Let λ/sub n/ be the smallest value of $\lambda > 1$ for which $x = 1$ is a periodic point of period 2/sup n/. It is proved that for $e < 0.99$, λ/sub n/ - λ/sub n-1/ $\cong$ k(λ/sub ∞//e)/sup -2n/, where k is some constant and λ/sub ∞/ = lim/sub n$\rightarrow\infty$/λ/sub n/. The same conclusion probably holds for any $e < 1$. This behavior is substantially different from that found by Feigenbaum and others for the case where f(x) assumes its maximum value for a unique x. Numerical investigations are reported for functions related to the trapezoid function.

22887 Identification of noise in linear data sets by factor analysis. Roscoe, B.A.; Hopke, P.K. (Univ. of Illinois, Urbana). *Journal of Radioanalytical Chemistry;* **70**: No. 1-2, 483-495(1982). Contract AC02-80EV10403.

With the use of atomic and nuclear methods to analyze samples for a multitude of elements, very large data sets have been generated. Due to the ease of obtaining these results with computerized systems, the elemental data acquired are not always as thoroughly checked as they should be leading to some, if not many, bad data points. It is advantageous to have some feeling for the trouble spots in a data set before it is used for further studies. A technique which has the ability to identify bad data points, after the data has been generated, is classical factor analysis. The ability of classical factor analysis to identify two different types of data errors make it ideally suited for scanning large data sets. Since the results yielded by factor analysis indicate correlations between parameters, one must know something about the nature of the data set and the analytical techniques used to obtain it to confidentially isolate errors.

22888 Solving sparse symmetric definite quadratic λ-matrix problems. Scott, D.S. *Bit;* **21**: 475-480(1981). Contract W-7405-ENG-26.

This paper describes a method for computing all the eigenvalues in a user supplied interval [a,b], and their associated eigenvectors, of the symmetric definite quadratic λ-matrix problem $(M \lambda^2 + C \lambda + K)x = 0$, where the matrices are sufficiently sparse that methods based on similarity transformations are inappropriate. Only the triangular factorization of one n x n matrix need be computed.

9903 Information Handling

REFER ALSO TO CITATION(S) 22341

22889 (ANL/NESC—403R) TIGIR2; modular document information system. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy, J.H.; Zackrison, A.E. (Knolls Atomic Power Lab., Schenectady, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048403.

TIGIR2 is a modular program designed to generate and maintain libraries of document information (abstracts, bibliographic information, index terms, and other significant information), to retrieve the information selectively, to print the retrieved information in various output formats, and to generate statistics of the information files.CDC6600; FORTRAN and ASCENT; SCOPE.

22890 (ANL/NESC—856) ANSDDF; ANSI data description file utilities. Fowler, T.B.; Tobias, M.L.; Fox, J.N.; Lawler, B.E.; Koppel, J.U.; Triplett, J.R.; Lynn, L.L.; Waldman, L.A.; Goldberg, I.; Greebler, P.; Kelley, M.D.; Davis, R.A.; Keck, C.E.; Redfield, J.A.; Murphy,; McNeely, B.N. (Los Alamos National Lab., NM (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048856.

ANSDDF is an implementation of Level 1 of the draft proposed American National Standard Specification for an Information Interchange Data Description File. Level 1 is concerned only with unstructured alphanumeric data. The implementation, designed to provide the interface of the standard interchange format with the user system, is in the form of a user-callable multiple entry PL/I subprogram that performs the functions necessary for the creation and processing of the standard files. The implementation is for magnetic tape and the labels and block structures used are those defined for the spanned record option in ANSI X3.27-1977, Magnetic Tape Labels and File Structure for Information Interchange.IBM360,370,303x; PL/I; OS/360; 160K bytes of memory are needed for execution of both the ANSBLD and ANSLST procedures.

22891 **(ANL/NESC—915) CHECKER; CRECT; STNDRD; FIZCON; PSYCHE; RESEND; INTER; INTEND; SUMRIZ; PLOTEF; LSTFCV; RIGEL ENDF/B V5 processing codes; CHECKER, CRECT,.. AND ENDF/B V5 processing codes.** Dunford, C.L. (Brookhaven National Lab., Upton, NY (USA)). [nd]. vp. Available from NTIS and National Energy Software Center, Argonne National Laboratory, 9700 South Cass Avenue, Argonne Il 60539. Order Number DE83048915.

Source decks (CHECKER 2583 cards, CRECT 262 cards, STNDRD 1200 cards, FIZCON 4817 cards, PSYCHE 5108 cards, RESEND 2911 cards, INTER 870 cards, INTEND 1581 cards, SUMRIZ 2220 cards, PLOTEF 6447 cards, LSTFCV 4106 cards, RIGEL 2226 cards) Reference report, BNL-50300, Memorandum, and NESC Note.

This collection of ENDF/B processing codes consists of twelve programs for processing ENDF/B (Evaluated Nuclear Data File Version B) Version-V data files. The programs perform the following functions: CHECKER checks ENDF/B data files for legal formats. CRECT corrects an ENDF/B BCD tape by inserting and deleting data. STNDRD standardizes ENDF/B data formats (removing E's in exponential format and inserting zeroes in control cards where necessary), resequences files, and creates or updates the dictionary for all materials. FIZCON checks ENDF/B data for physics consistency and to see that recommended procedures are followed. PSYCHE performs physics checks of ENDF/B data, calculates resonance integrals, checks secondary particle energy conservation, and performs reaction Q-value and Chart-of-the-Nuclides tests. RESEND generates infinitely dilute unbroadened point cross sections in the ENDF format by combining ENDF File 3 background cross sections with points calculated from File 2 resonance parameter data. INTER is a special version of the general-purpose ENDF integration program INTEND. INTEND is a general-purpose program which generates energy integrals from the ENDF/B cross section files using an arbitrary weight function and an arbitrary energy grid. SUMRIZ creates a summary for an ENDF material. A description and selection of useful data are written in each case. PLOTEF plots the ENDF/B data according to material number and file number from BCD input in standard, rather than alternate, format. LSTFCV produces interpreted listings of information from a BCD standard arrangement ENDF/B tape. RIGEL selectively or in toto retrieves ENDF/B data from one to nine ENDF/B tapes, merges the retrieved ENDF/B data onto from one to eight ENDF/B result tapes, changes the arrangement (standard to alternate or vice versa), and changes the mode (BCD to binary or vice versa).

22892 **(N—82-26029) Telemetry system for acquisition and recording of data: STAR.** Jeszensky, P.J.E. (Foundation for the Technical Development of Engineering, Sao Paulo (Brazil)). Jul 1981. 13p. (Portugese). NTIS, PC A12/MF A01.

In Instituto de Pesquisas Espaciais 1st Seminar on Use of the Natl. System for Collection of Satellite Data p 49-62 (SEE N82-26026 16-82).

Operation of the STAR telemetric data acquisition and recording system is described. The information flow through the network, the form of the messages, and the coding are described. A functional description of the elements of the network, including the ground station, is presented.

22893 **(UCRL—88735) Managing information for effective use: a case study.** Frobose, R.H. (Lawrence Livermore National Lab., CA (USA)). 14 Feb 1983. Contract W-7405-ENG-48. 7p. (CONF-830414—1). NTIS, PC A02/MF A01. Order Number DE83007345.

From 5. annual international conference on computer capacity management; New Orleans, LA, USA (18 Apr 1983).

An organization's information problems usually do not result from a lack of data but rather from the fact that the information is frequently in an inaccessible form. This paper describes a system which solves that problem by automatically handling the migration of the information that we gather about computer-center operations. It takes advantage of the fact that the inforamtion at various intermediate stages is amenable to different views and hence appropriate for answering different information requirements.

9904 Law

22894 **(KFK—3275) Technical risks and law.** Bluemel, W.; Wagner, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.); Hochschule fuer Verwaltungswissenschaften, Speyer (Germany, F.R.)). Nov 1981. 52p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE83750181.

Course of lectures of Karlsruhe Research Centre and the University of Administrative Science, Speyer on May 18, 1981, June 1, 1981, June 22, 1981.

Using chemical and nuclear installations as examples, the five lectures attempt to bring the world of technology and the world of law closer together.

22895 (KFK—3275, pp 5-11) **Technical risks and Constitutional Law.** Benda, E. Nov 1981. (In German). Dep. NTIS (US Sales Only).

Course of lectures of Karlsruhe Nuclear Research Centre and University of Administrative Science, Speyer on May 18, 1981, June 1, 1981, June 22, 1981.

In Technical risks and law.

The author regards technical risk assessment as a legal problem of increasing importance. He discusses the delimitation of hazard, risk and damage; the protective duty of the state, and security of basic rights; the determination of risk elements; the interpretation of undetermined legal concepts. The essential question is as to what extent the undetermined legal concepts are subject to judicial reviews. A transition from 'subject-related' to 'procedural' reviewing requires corresponding insitutional and procedural rules according to which technical safety rules will be created. Under Constitutional Law, it does not seem to be satisfying to bind the courts to technical rules as long as there are none.

9905 Civilian Defense

REFER ALSO TO CITATION(S) 20728, 21660, 21661

22896 **(AD-A—119825/8) State-of-the-art assessment: shelter habitability. Final report Oct 81-Sep 82.** Wright, M.D.; Chessin, R.; Laney, M.; Cox, L. (Research Triangle Inst., Durham, NC (USA)). Sep 1982. 191p. (RTI—2265/00/04F). NTIS, PC A09/MF A01.

The objectives of this study were to assess the state-of-the-art of shelter habitability research, to describe nuclear weapons effects and mitigation techniques, to summarize current civil defense programs and policies, and to identify future research needs related to shelter habitability. The work consisted of an extensive review of civil defense literature, a review of non-civil defense literature through computer searches, and personnel communications with individual researchers. The information obtained was summarized into a state-of-the-art assessment of research related to shelter habitability. General conclusions were listed to identify areas where there is general agreement among researchers. Recommendations for further study were made for areas where there is disagreement among researchers and where there are important unanswered questions.

22897 **(AD-A—119914/0) Principles of warning and criteria governing eligibility of National Warning Systems (NAWAS) terminals.** (Federal Emergency Management Agency, Washington, DC (USA)). 9 Nov 1981. 18p. (CPG—1-14). NTIS, PC A02/MF A01.

The purpose of the guide is to provide civil defense and emergency management personnel with information concerning the basic principles of warning. The guide includes descriptions of the types of warning signals and their meaning, the Emergency Broadcast System (EBS), tests, exercise terms, basic steps in dissemination of warning, and criteria governing eligibility of National Warning System (NAWAS) terminals.

CORPORATE AUTHOR INDEX

In the Corporate Index, report literature is indexed using the name of the organization or institution responsible for issuing the report. Headings are provided for all report literature and for published literature for which a corporate approach is especially desirable, e.g., symposium and conference proceedings.

Each entry under a corporate heading gives the document title and the volume and abstract numbers. The document type, e.g., R for Report; country of publication, e.g., US; and language of the document, e.g., In German; are given in parentheses at the end of the entry. If no language statement appears, the language is English. Tables of document types and country of publication codes appear after the indexes.

DOE Energy Information Data Base: Corporate Author Entries (DOE/TIC-4585) is used in the standardization of corporate entries. DOE/TIC-4585 is available for purchase from the National Technical Information Service (NTIS), U. S. Department of Commerce, Springfield, Virginia 22161.

Energy-conservation strategies and their effects on travel demand, 8:20947 (R;US)

Battelle Columbus Labs., OH (USA)

ADEP; 1-dimensional and 2-dimensional few-group space-time kinetics, 8:20539 (R;US)

ECCSA4; loss-of-coolant & emergency cooling, 8:20566 (R;US)

Environmental assessment of coal cleaning processes. Final report Jul 76-Sep 79, 8:19600 (R;US)

Evaluation of advanced materials. Final report, 8:21124 (R;US)

FRCRL2; LOCA fission product release analysis, 8:20657 (R;US)

MIRAB;MIRAP; containment system iodine removal, 8:20656 (R;US)

MUCHA1;MUCHA2; multiple channel analysis emergency core cooling, 8:20658 (R;US)

NURLOC-1.0; loss-of-coolant thermal analysis, 8:20319 (R;US)

Research options for the development of sensors to measure the thermal state of solid steel bodies. Draft final report, 8:20989 (R;US)

User's guide to SOLREL: a simulation of reliability and availability of photovoltaic systems, 8:20047 (R;US)

Battelle Human Affairs Research Center, Seattle, WA (USA)

Engineering expertise on shift in nuclear power plants: the foreign experience, 8:20316 (R;US)

Battelle-Institut e.V., Frankfurt am Main (Germany, F.R.)

Development of a cadmium selenide thin film solar cell. Final report, Mar. 1980, 8:19981 (R;DE;In several languages)

Battelle Memorial Inst., Columbus, OH (USA). Office of National Waste Terminal Storage Integration

Projected costs for mined geologic repositories for dispoal of commercial nuclear wastes, 8:19857 (R;US)

Battelle Memorial Inst., Columbus, OH (USA). Office of Nuclear Waste Isolation

Technical progress report for the quarter, 1 April-30 June 1982, 8:19858 (R;US)

Battelle Pacific Northwest Labs., Richland, WA (USA)

Dosimetric and behavioral analysis of microwave-drug synergistic effects on operant behavior in the rat. Final report Sep 79-Dec 81, 8:22022 (R;US)

BCS Richland, Inc., WA (USA)

TIDY3;TIDY4; utility to edit fortran source programs, 8:22845 (R;US)

BDM Corp., Albuquerque, NM (USA)

Verification of cryogenic blowout control technology for offshore wells. Final report, 8:19689 (R;US)

Bechtel Corp., San Francisco, CA (USA)

Dual alkali acceptance test at Louisville Gas and Electric Company; Volume I. Acceptance test and appendices A-C. Final report Apr 79-Jul 80, 8:20298 (R;US)

Dual alkali acceptance test at Louisville Gas and Electric Company; Volume II. Appendices D-F. Final report Apr 79-Jul 80, 8:20299 (R;US)

Dual alkali acceptance test at Louisville Gas and Electric Company; Volume III. Appendices G-J. Final report Apr 79-Jul 80, 8:20300 (R;US)

FOG; one-dimensional few-group few-gp diffusion slab cylinder sphere, 8:22420 (R;US)

Bechtel Group, Inc., San Francisco, CA (USA)

Modular HTGR systems design and cost summary, 8:20480 (R;US)

Monolithic HTGR - reformer design and cost summary: thermochemical pipeline application, 8:20479 (R;US)

Preliminary evaluation of the Avco-Ebara FGT process. Final report, 8:19589 (R;US)

Bendix Corp., Baltimore, MD (USA). Environmental and Process Instruments Div.
Coal mine dust personal sampler (CMDPS). Final report, 8:19660 (R;US)

Bendix Corp., Cocoa Beach, FL (USA). Launch Support Div.
Assessing safety in fossil fueled electric power generating plants. Final report, 8:20281 (R;US)

Bendix Corp., Kansas City, MO (USA)
Nontoxic polyimides. Final report, 8:21155 (R;US)

Bendix Field Engineering Corp., Grand Junction, CO (USA)
Assessment of uranium potential for the NURE quadrangle evaluation program: the elicitation procedure. National Uranium Resource Evaluation, 8:19789 (R;US)
Computer-modeling codes to improve exploration nuclear-logging methods. National Uranium Resource Evaluation, 8:19790 (R;US)
Probabilistic endowment appraisal system based upon the formalization of geologic decisions. National Uranium Resource Evaluation. Final report: demonstration and comparative analysis of estimates and methods, 8:19795 (R;US)
Uranium hydrogeochemical and stream sediment reconnaissance of the Beaver NTMS quadrangle, Alaska. National Uranium Resource Evaluation, 8:19792 (R;US)
Uranium hydrogeochemical and stream sediment reconnaissance of the Sterling NTMS quadrangle, Colorado. National Uranium Resource Evaluation, 8:19793 (R;US)
Uranium hydrogeochemical and stream sediment reconnaissance of the Ketchikan NTMS quadrangle, Alaska. National Uranium Resource Evaluation, 8:19794 (R;US)

Bendix Field Engineering Corp., Grand Junction, CO (USA). Grand Junction Operations
Application of NURE data to the study of crystalline rocks in the Wyoming uranium province, 8:19791 (R;US)

Bend Research, Inc., OR (USA)
Membrane separation technology in the 1980's. ECUT: Energy Conversion and Utilization Technology Program. Biocatalysis research activity. Final report, 8:20971 (R;US)

BENMOL Corp., Alexandria, VA (USA)
Alexandria fluidized-bed process-development unit. Hot-mode testing , 8:20256 (R;US)

Bergen Univ. (Norway)
Oil spill identification by chemical analysis, 8:19727 (R;NO)

Big Green Investments, Denver, CO (USA)
Solar heating system for office/warehouse buildings: piping and ductwork drawings (Engineering Materials), 8:20118 (E;US)

Birmingham Univ. (UK)
Particle acceleration in solar flares, 8:22105 (R;FR)

Boeing Co., Huntsville, AL (USA). Boeing Huntsville Simulation Center
FAIMOS; one-dimensional, multigroup diffusion in slab, cylindrical, or spherical geometries , 8:22427 (R;US)
PERT; one-dimensional perturbation for AIM and FOG codes, 8:22422 (R;US)
TEMPEST2; thermal neutron spectrum cross sections, 8:22424 (R;US)

Boeing Co., Seattle, WA (USA)
Design, fabrication and test of graphite/polyimide composite joints and attachments for advanced aerospace vehicles, 8:21138 (R;US)
Selected advanced aerodynamic and active control concepts development, 8:20951 (R;US)

Boeing Engineering and Construction, Tukwila, WA (USA)
Pacific Bulk commodity Transportation System, phase III. Volume IV: marad/Boeing study. Final report, 8:19624 (R;US)

Bonn Univ. (Germany, F.R.). Landwirtschaftliche Fakultaet
Heat pumps for air conditioning in animal shelters and for heating of buildings, 8:20974 (R;DE;In German)

Boston Univ., MA (USA)
Infrared-absorption spectrum of free carriers in polar semiconductors. Progress report, July 1, 1982-June 30, 1983, 8:21160 (R;US)

Boston Univ., MA (USA). Dept. of Chemistry
Formation of fuel via photochemical electron transfer. Progress report, February 1, 1982-January 31, 1983, 8:21266 (R;US)

Boston Univ., MA (USA). Dept. of Physics
Dispersion of the refractive index near the absorption edge in compound semiconductors, 8:21161 (R;US)

Boyce Thompson Inst. for Plant Research, Ithaca, NY (USA)
Carbon metabolism in legume nodules. Progress report, June 1, 1982-January 30, 1983, 8:21910 (R;US)

Brigham Young Univ., Provo, UT (USA). Dept. of Chemical Engineering
Combustion research needs, 8:21301 (R;US)

Brigham Young Univ., Provo, UT (USA). Dept. of Chemistry
Separation of asphaltenes using high-resolution supercritical-fluid chromatography. Progress report, December 1, 1982-February 28, 1983, 8:19561 (R;US)

British Gas Corp., London
Description of criteria and testing methods for the hardware and software of microcomputer systems in applications relating to the safeguarding of systems in accordance with safety regulations, 8:22884 (TG;GB)

British Library, Boston Spa. Lending Div.
Process for the removal of oxides of nitrogen and the aqueous solution used, 8:21193 (R;US)

Brookhaven National Lab., Upton, NY (USA)
An e-p primer, 8:22249 (R;US)
Antiproton-nucleus interactions, 8:22367 (R;US)
AVERAGE; unresolved region average cross section calculations, 8:22474 (R;US)
BESFIT; diffraction model elastic scattering cross sections, 8:22176 (R;US)
Buoyancy-induced flow studies in thermally stratified loop of a double-envelope building, 8:20894 (R;US)
CHECKER;CRECT;DAMMET;PLOTFB; SLAVE3 ENDF/B V1 processing codes; CHECKER,CRECT,DAMMET,PLOTFB,... ENDF/B V1 proc, 8:22477 (R;US)
CHECKER;CRECT;STNDRD;FIZCON; PSYCHE;RESEND;INTER;INTEND;SUMRIZ;PLOTEF;LSTFCV;RIGE ENDF/B V5 processing codes; CHECKER,CRECT,.. AND ENDF/B V5 processing codes, 8:22891 (R;US)
Coal-oil mixtures: an alternative fuel for the commercial sector. Annual report, fiscal year 1981, 8:19627 (R;US)
CRECT;CHECKER;RIGEL;PLOTFB; LISTFC;DICTION;SLAVE3;DAMMET ENDF/B V2 processing codes, 8:22349 (R;US)
Data-acquisition system for environmental monitoring aboard a twin-engined aircraft, 8:21689 (R;US)
Effects of magnetic non-linearities on a stored proton beam and their implications for superconducting storage rings, 8:21485 (R;US)
eP physics at the CBA, 8:22251 (R;US)
Examination of failed studs from No. 2 steam generator at the Maine Yankee Nuclear Power Station, 8:20382 (R;US)
Facility for in-vivo measurement of lithium, 8:21896 (R;US)
Higher-order modes calculation of rf cavity with cylindrical symmetry, 8:21484 (R;US)
Improved four-stage accel-decel production of low-energy stripped heavy ions, 8:21499 (R;US)
Laser-driven grating linac, 8:21472 (R;US)
NOAH; one-dimensional, one-group space-time diffusion feedback, 8:22485 (R;US)
RAMP1; Reich-Moore resolved region cross-sections, 8:22503 (R;US)
RESEND;ADLER; ENDF/B resonance cross section codes, 8:20529 (R;US)
Review of Panel on Reference Nuclear Data surveys and discussions on reference nuclear data needs, 8:22342 (R;US)
Review of the Limerick Generating Station Probabilistic Risk Assessment, 8:20721 (R;US)
SIGPLOT; resolved multilevel Briet-Wigner cross section calculations, 8:22475 (R;US)
Status reports on ISABELLE magnets, 8:21500 (R;US)
Structural maps and parameters important to alloy phase stability, 8:21040 (R;US)
THRES2; statistical model reaction cross-sections, 8:22355 (R;US)
Waste-Form Development Program. Annual progress report, October 1981-September 1982, 8:19818 (R;US)

Brooklyn Coll., NY (USA). Dept. of Physics
Optical and electrochemical investigation of ruthenium and iridium and their oxides in relation to their electrocatalytic activity. Progress report, 8:21122 (R;US)

Brown, Boveri und Cie A.G., Heidelberg (Germany, F.R.). Zentrales Forschungslabor
Exhaust sensor for heating systems, 8:20939 (TG;US)

Brown Univ., Providence, RI (USA). Div. of Engineering
Characterization of tar products from rapid pyrolysis of bituminous coals. Fifth quarterly progress report, October 1982-December 1982, 8:19560 (R;US)

Budd Co., Fort Washington, PA (USA). Technical Center
Design and evaluation of low-cost stainless steel - fiberglass-foam blades for large wind-driven generating systems, 8:20211 (R;US)
Development and fabrication of solar-collector SMC reflector assemblies, 8:20133 (R;US)

Bundesministerium fuer Wirtschaft, Bonn (Germany, F.R.)
Electric power supply in the Federal Republic of Germany - August 1981, 8:20846 (R;DE;In German)
Electric power supply in the Federal Republic of Germany - February 1982, 8:20847 (R;DE;In German)
Electric power supply in the Federal Republic of Germany in the year 1981, 8:20848 (R;DE;In German)

Bureau Energie Onderzoek Projecten, Patten (Netherlands)
Building licenses for wind turbines. Preliminary directives and case studies, 8:20210 (R;NL;In Dutch)
Solar energy in the Netherlands. Program of the second phase of the National Research Program on Solar Energy (1982-1985), 8:19964 (R;NL;In Dutch)

Bureau of Mines, Albany, OR (USA). Albany Research Center
Introduction of sulfur into copper converter slags to produce copper matte. Report of investigations/1982, 8:20986 (R;US)

Bureau of Mines, Avondale, MD (USA). Avondale Research Center
The solubility of methane, carbon dioxide, and oxygen in brines from 0 deg to 300 deg c. Report of investigations/1982, 8:20200 (R;US)

Bureau of Mines, Denver, CO (USA). Intermountain Field Operation Center
Preliminary testing of a prototype portable x-ray fluorescence spectrometer. Information circular, 8:21586 (R;US)

Bureau of Mines, Pittsburgh, PA (USA). Energy Research Center
Design of heat-recovery and seed-recovery units in MHD power generation, 8:20878 (R;US)
MHD combustor designs and materials of construction, 8:20879 (R;US)

Bureau of Mines, Reno, NV (USA). Reno Research Center
Operation of a mineral recovery unit on brine from the Salton Sea Known Geothermal Resource Area. Report of investigations/1982, 8:20167 (R;US)

Bureau of Mines, Tuscaloosa, AL (USA). Tuscaloosa Research Center
Refractory properties of brick produced from beneficiated chrome-containing furnace linings. Report of investigations/1982, 8:20983 (R;US)

Bureau of Mines, Washington, DC (USA)
Bureau of Mines, oil shale data bank. Part 1 - bibliography: Volume 2, 8:19776 (R;US)
Bureau of Mines oil shale data bank. Part III. Recent research projects, 8:19777 (R;US)
Bureau of Mines oil-shale data bank. Part I. Bibliography. Volume 1, 8:19775 (R;US)
Bureau of Mines oil-shale data bank. Part II. Patents, 8:19778 (R;US)

Bureau of Mines, Washington, DC (USA). Div. of Education and Training Services
Haulage accident prevention, 8:19659 (R;US)

Bureau of Reclamation, Denver, CO (USA). Engineering and Research Center
Characterization of LaVerkin Springs water and methods for its reuse in energy development, 8:21881 (R;US)

Bureau of the Census, Washington, DC (USA)
Annual housing survey: 1979. United States and regions. part f: energy-related housing characteristics, 8:20934 (R;US)

Burns and Roe, Inc., Woodbury, NY (USA)
MHD oxidant intermediate temperature ceramic heater study. Final report, 8:20882 (R;US)

Burns and Roe Services Corp., Oradell, NJ (USA)
Alexandria fluidized-bed process-development unit. Hot-mode testing , 8:20256 (R;US)

Proposed classification of biotapological marine ecosystems off the coast of Italy. Part I, 8:21877 (R;IT;IT)

Comitato Nazionale per l'Energia Nucleare, Casaccia (Italy). Dipartimento Reattori Veloci

ALEATO: code for processing numerical data by IBM-370, 8:22825 (R;IT;IT)

Comitato Nazionale per l'Energia Nucleare, Casaccia (Italy). Dipartimento Ricerca Tecnologica di Base e Avanzata

ALEATO: code for processing numerical data by IBM-370, 8:22825 (R;IT;IT)

Comitato Nazionale per l'Energia Nucleare, Fiascherino (Italy). Dipartimento Radiazioni e Ricerche di Sicurezza e Protezione

Proposed classification of biotapological marine ecosystems off the coast of Italy. Part I, 8:21877 (R;IT;IT)

Comitato Nazionale per l'Energia Nucleare, Frascati (Italy). Lab. Nazionali di Frascati

Detailed numerical code to analyze pumping linear cavities for solid-state lasers, 8:21399 (R;US)

Comitato Nazionale per l'Energia Nucleare, Rome (Italy)

Analysis of characteristic curves of the PC.1 and PC.2 centrifugal pumps of the CPC-1 system, 8:20417 (R;DE;IT)

Management and control of the IBM 370-168 system with the AG02 system, 8:22871 (R;IT;IT)

Comitato Nazionale per l'Energia Nucleare, Rome (Italy). Direzione Centrale della Sicurezza Nucleare e della Protezione Sanitaria

Proposed classification of biotapological marine ecosystems off the coast of Italy. Part I, 8:21877 (R;IT;IT)

Comitato Nazionale per l'Energia Nucleare, Trisaia (Italy). Dipartimento Ciclo del Combustibile

Annual meteorological data at CRN Trisaia, 1978, 8:21677 (R;IT;IT)

Annual meteorological data at Trisaia, 1976, 8:21675 (R;IT;IT)

Annual meteorological data for CRN Della Trisaia, 1977, 8:21676 (R;IT;IT)

Annual meteorological data for CRN Della Trisaia, 1979, 8:21678 (R;IT;IT)

Commission of the European Communities, Brussels (Belgium)

Geothermal heating, 8:20186 (R;XE)

Commission of the European Communities, Ispra (Italy)

^{237}U nelle ricadute atmosferiche): Ispra 1980 (^{237}U in atmospheric fall-out): Ispra 1980), 8:21804 (R;US)

Commission of the European Communities, Karlsruhe (Germany, F.R.). European Inst. for Transuranium Elements

Correlation between fuel structure and mechanical properties of UO$_2$, 8:20611 (R;US)

Mechanical stability of a Cm-doped celsian glass-ceramic, 8:21156 (R;XE)

Commission of the European Communities, Luxembourg

A european atomic energy Community Report. Part I: comparative risks from electricity generating systems. Part II: risk assessment of energy systems. Final report, 8:20274 (R;US)

A theoretical study on the growth of large sodium vapour bubbles in liquid sodium, 8:20692 (R;US)

Advanced electrochemical energy storage devices, 8:20750 (R;XE)

Analysis of the factors which determine the COP of a heat pump and a feasibility study on ways and means of increasing same, 8:20902 (R;XE)

Conversion and chemical storage of solar energy in a photoelectrochemical cell, 8:20000 (R;XE)

Corrosion behaviour of engineering materials at elevated temperatures in an oxidising environment containing sulphur derivatives: influence of the composition of aggressive media and of the alloys under test (tenue a la corrosion a temperature elevee de materiaux par les milieux oxydants contenant des derives soufres: influence de la composition des phases agressives et des allinges exprimentes). Final report, 8:21082 (R;US)

Design, construction and testing of a gas engine driven high temperature industrial heat pump, 8:20973 (R;XE)

Development of a method of preparing ZrO$_2$ (Y$_2$O$_3$) thin film electrolytes on porous supporting materials, 8:19909 (R;XE;In German)

Development of a thermal storage system based on the heat of absorption in hygroscopic materials, 8:20142 (R;XE)

Dutch solar pilot test facility, 8:20092 (R;XE)

Effect of the electrical field in the membrane of photosynthesis, 8:19999 (R;XE)

EFOM 12C software: general overview. Final report, 8:22876 (R;US)

Energy models of European communities implementation and methodological tests in Italy. Final report, 8:20796 (R;US)

Energy revovery from waste, with special regard to the possibility of producing high-grade granulated insulating materials by swelling processes, 8:20972 (R;DD;In German)

Etude des possibilites de recuperation des chaleurs perdues dans les installations thermiques: application aux cokeries classiques (study of ways of recovering waste heat from heat consuming installations: applications to traditional coke ovens). Final report, 8:20978 (R;US)

Experimental Rankine cycle engine designed for heat recovery from exhaust gases of industrial plants, 8:21471 (R;XE)

Final report of the E.C. comparison of the national standard pyrheliometers, 8:19968 (R;XE;In French)

Gas bubble behaviour and ohmic potential drop during water electrolysis, 8:19911 (R;XE)

Kinetic factors controlling the yield of photosystem II and O$_2$ emission, 8:21267 (R;XE)

Long-term alternative energy R and D strategies. Final report, 8:20768 (R;US)

Novel oxides having high protonic conductivity as electrolyte for low temperature water vapour electrolysis, 8:19910 (R;XE)

Nuclear data guide for reactor neutron metrology. part I: activation reactions (1979 edition). Part II: fission reactions (1979 edition), 8:20558 (R;US)

Photochemical dissociation of water adsorbed in artificial membranes made from phyllosilicates, 8:21270 (R;XE)

Photochemical dissociation of water by means of visible light, 8:21269 (R;XE)

Pilot Test Facility (P.T.F.), 8:20094 (R;XE;In French)

Present state of technology of recovery and conversion process for synthetic fuels, 8:20864 (R;XE)

Present state of technology of recovery and conversion process for synthetic fuels, 8:19518 (R;XE)

Presentation of the software for central control system 1 of the solar pilot test facilities. Vol. 3, 8:20093 (R;XE)

Properties and electron transfer reactivity of coordination compounds for the photochemical splitting of water, 8:19912 (R;XE)

Radiation protection: progress report. 1981, 8:21967 (R;US)

Recovery of heat from exhaust air of spray driers in the dairy industry. Summary report (final), 8:20976 (R;US)

Regional analysis of potential energy production from agricultural wastes: a technical and economic study. Final report, 8:19957 (R;US)

Round table meeting on chemical and physical valorisation of coal, 8:19519 (R;XE)

Signal transmission via the electrical house wiring system for a control system for energy conservation in households and small business, 8:20903 (R;XE;In German)

State of the art of winning and conversion processes for synthetic fuels, 8:19530 (R;XE;In German)

Studies on parameterization of global, diffuse and direct solar radiation, 8:19967 (R;XE)

Study and evaluation of the latent cooling potential of chemical de-humidifiers, 8:20096 (R;XE)

Study of primary reactions of photosynthesis in green plants by rapid flash absorption spectroscopy, 8:21268 (R;XE)

- Study on the propagation of hydraulic fractures in rocks (etude sur la propagation des fractures hydrauliques dans les roches). Final report, 8:19766 (R;US)
- Summary report of the CEC-solar radiation data-programme 1975-1979, 8:19969 (R;XE)
- The evaluation of the Communities' geothermal energy, production and utilization of hydrogen, and systems analysis: development of models R and D sub-programmes. Research evaluation report no. 2, 8:20143 (R;US)
- Thermodynamic and engineering assessment of hybrid processes for the production of hydrogen with specific application to the Mark 13 process, 8:19908 (R;XE)
- Trends in energy demand in Italy (energy demand model for Italy). Final report, 8:20797 (R;US)
- United Kingdom solar pilot test facility, 8:20095 (R;XE)
- Use of immobilized hydrogenase for hydrogen production- final report, 8:19918 (R;US)

Commission of the European Communities, Strasbourg (France)

- Substitution of coal for petroleum in 'other industries', 8:20809 (R;XE;In German)

Computer Sciences Corp., Albuquerque, NM (USA)

- 200 kj copper foil fuses. Final report, 8:21304 (R;US)

Connecticut Univ., Storrs (USA)

- Alcohol recovery and carbon dioxide purification in alcohol plants using semipermeable membranes. Final technical report, September 1, 1981-August 31, 1982, 8:19989 (R;US)

Environmental and socio-economic status of the Hampshire energy project, 8:21888 (R;US)
Evaluation of administrative procedures at the Synthetic Fuels Corporation, 8:20813 (R;US)
Status of strategic petroleum reserve activities as of September 30, 1982, 8:19747 (R;US)
General Atomic Co., San Diego, CA (USA)
BLOOST6; combined kinetics two-dimensional heat transfer, 8:20505 (R;US)
BUG2; two-dimensional multigroup diffusion & burnup in xy, rz geometries, 8:22495 (R;US)
BUGTRI; two-dimensional multigroup diffusion & burnup in triangular geometries, 8:22496 (R;US)
COHBE;PREP; coherent inelastic scattering law calculations, 8:22478 (R;US)
2DF; two-dimensional, multigroup discrete ordinate code, 8:22430 (R;US)
DYNAM; dynamic analysis boiling flow steam, 8:21413 (R;US)
FEVER7; one-dimensional multigroup diffusion and depletion, 8:22454 (R;US)
FLAC; steady-state flow, pressure distribution, 8:20568 (R;US)
FLANGE1; scattering law cross section calculation, 8:22437 (R;US)
FREVAP6; HTGR metallic fission product release, 8:20602 (R;US)
FSDP3; pointwise cross sections from Breit-Wigner parameters, 8:22434 (R;US)
GADOSE;DOSET; HTGR accident analysis dose calculations, 8:20391 (R;US)
GAFFE; equilibrium fuel cycle calculation, 8:20470 (R;US)
GAFGAR;p3t;PROC;TAPCOP; spectra and group-averaged cross section calculation, 8:20511 (R;US)
GAKER; inelastic scattering cross section calculations for moderators, 8:22448 (R;US)
GAKIT; one-dimensional, multigroup kinetics with temperature feedback, 8:22470 (R;US)
GAMBLE5; two-dimensional, multigroup diffusion in xy and rz geometry, 8:22435 (R;US)
GAMTRI; two-dimensional, multigroup, diffusion triangular mesh geometries, 8:22484 (R;US)
GAND; GAFGAR cross-section library preparation, 8:20514 (R;US)
GANDY3; unresolved resonance cross secton calculation, 8:22460 (R;US)
GAPER2D; 2-dimensional perturbation calculation from 2DF output, 8:20532 (R;US)
GAPOTKIN; space-independent reactor kinetics, 8:20512 (R;US)

GASA (GA Stability Analysis); stability analysis for reactor kinetic equations, 8:20504 (R;US)
GASKET; thermal scattering law calculation, 8:22440 (R;US)
GASP7; one-dimensional burnup power distribution search, 8:22455 (R;US)
GATT; three-dimensional, few-group diffusion calculations in hexagonal geometries, 8:22476 (R;US)
GAZE2; one-dimensional multigroup diffusion in slab, spherical, and cylindrical geometries, 8:22491 (R;US)
GGC4; multigroup cross sections fast thermal spectra, 8:22451 (R;US)
GRDWRK; grid generation for safe programs, 8:21312 (R;US)
HEXSCAT; elastic scattering cross sections hexagonal lattice, 8:22449 (R;US)
HTGR Steam Cycle/Cogeneration Design Development Plan for Nuclear Steam Supply System. Volume II. Design development plan, 8:20483 (R;US)
HTGR steam-cycle/cogeneration lead plant design and cost report. Volume II. Nuclear Steam Supply System, 8:20484 (R;US)
HTGR steam-cycle/cogeneration technology development plan for Nuclear Steam Supply System. Volume III. Technology development plan, 8:20482 (R;US)
MUSCAT; view factor shielding code cavity geometry, 8:22438 (R;US)
OPUS; power plant performance and price study, 8:20469 (R;US)
PSEUDO; statistical resonance parameter calculations, 8:22450 (R;US)
PWCOST; reactor fuel cycle cost calculation, 8:20473 (R;US)
SAFE-CRACK; viscoelastic analysis of concrete, 8:21434 (R;US)
SAFE-CREEP; viscoelastic analysis of concrete, 8:21151 (R;US)
SAFE-2D; plane & axisymmetric stress analysis, 8:21320 (R;US)
SAFE-3D; three-dimensional composite structure stress study, 8:21314 (R;US)
SAFE-PLANE; plane stress analysis, two-dimensional bodies, 8:21308 (R;US)
SHELL5; thin shell 3-dimensional structural analysis, 8:21435 (R;US)
TACASI; analysis of resonance measurements, 8:22487 (R;US)
TAC3D; transient three-dimensional heat transfer program, 8:21411 (R;US)
TEMCO7; temperature coefficient calculation, 8:22456 (R;US)
TOAD; processing of analyzer gamma-ray spectra, 8:22348 (R;US)
ZPR-III Assembly 48 GAFGAR ENDF/B Data Tapes; ZPR-III assembly 48 GAFGAR ENDF/B data tapes, 8:20515 (R;US)

General Atomic Europe, Zurich (Switzerland)
GAUGE; two-dimensional, few-group, neutron diffusion in hexagonal geometries, 8:22459 (R;US)

General Dynamics/Convair, San Diego, CA (USA)
Study of multi-megawatt technology needs for photovoltaic space power systems. Volume 1: executive summary, 8:20041 (R;US)
Study of multi-megawatt technology needs for photovoltaic space power systems, volume 2. Final report, 8:20042 (R;US)

General Dynamics Corp., St. Louis, MO (USA)
Central-cell blanket-module-maintenance approach for the MARS high-temperature blanket, 8:22746 (R;US)

General Electric Co., Cincinnati, OH (USA). Aircraft Engine Group
MICHRD; microhardness measurement analysis, 8:21039 (R;US)

General Electric Co., Cincinnati, OH (USA). Nuclear Materials and Propulsion Operation
AVOID; annular void cross section calculation, 8:22445 (R;US)

General Electric Co., Pleasanton, CA (USA). Vallecitos Nucleonics Lab.
BURNUP; heavy element isotopic burnup analysis, 8:20509 (R;US)

General Electric Co., San Jose, CA (USA)
FLARE; three-dimensional reactivity and power distribution, 8:20494 (R;US)

General Electric Co., San Jose, CA (USA). Advanced Products Operation
RAPFU; fuel cycle parameters for fast breeders, 8:20407 (R;US)

General Electric Co., San Jose, CA (USA). Nuclear Energy Div.
BISYN; two-dimensional, multigroup diffusion synthesis calculations, 8:22447 (R;US)
ENDRUN2; multigroup constants from ENDF/B data, 8:20412 (R;US)
EXPN; analysis of pulsed neutron source data, 8:19904 (R;US)
GENED ENVIRONMENTAL ROUTINES; subroutine library, 8:22839 (R;US)
MANTA; steady-state thermal-hydraulic analysis, 8:20597 (R;US)
TDOWN; spatial & composition-dependent cross sections, 8:20541 (R;US)
TROUT; mug multigroup cross section library maintenance, 8:20538 (R;US)

General Electric Co., San Jose, CA (USA). Nuclear Engineering Div.
Mark I containment program structural-acceptance criteria: Plan Unique Analysis Application Guide, 8:20330 (R;US)
Oxygen suppression in boiling water reactors. Phase 2. Annual report 1981, December 2, 1980-December 31, 1981, 8:20326 (R;US)

Mathematical modeling of cooling-tower plumes, 8:21679 (R;US)
Illinois Univ., Urbana (USA)
Applications of nuclear reaction analysis for determining hydrogen and deuterium distribution in metals, 8:21195 (R;US)
High-energy photoproduction of rho and phi vector mesons, 8:22250 (R;US)
Neutron star binaries, pulsars and burst sources, 8:22110 (R;US)
Progress on the SLAC SNOOP diagnostic module for FASTBUS, 8:21607 (R;US)
Response of native plant individuals and communities to elevated CO_2. Progress report 1982, 8:21994 (R;US)
Illinois Univ., Urbana (USA). Dept. of Agricultural Economics
Economic balances of small scale ethanol from biomass operations, 8:19951 (R;US)
Illinois Univ., Urbana (USA). Dept. of Mechanical and Industrial Engineering
Measurement of solids motion in gas-fluidized beds. Technical progress report, 1 October 1982-31 December 1982, 8:21335 (R;US)
Illinois Univ., Urbana (USA). Dept. of Nuclear Engineering
Effects of nuclear elastic scattering and modifications of ion-electron equilibration power on advanced-fuel burns, 8:22724 (R;US)
Illinois Univ., Urbana (USA). Dept. of Physics
CODILLI; least squares analysis of resonance data, 8:22463 (R;US)
eP physics at the CBA, 8:22251 (R;US)
Illinois Univ., Urbana (USA). Fusion Studies Lab.
Tritium-assisted deuterium-based fusion breeders, 8:22702 (R;US)
Indian Inst. of Tech., Madras
^{127}I Moessbauer study of Chevrel-phase superconductors $Mo_6X_6I_2$ (X = S,Te), 8:21157 (R;US)
Indian Inst. of Tech., New Delhi
Two level multi-objective reconnaissance system study of a large water resource system. Doctoral thesis, 8:21882 (R;US)
Innsbruck Univ. (Austria)
A selected ion flow tube investigation on the quenching of N_2 (v not equal to o) by various neutrals, 8:22199 (R;AT)
Insights West, Inc., Los Angeles, CA (USA)
An assessment of vapor compression heat pump technology and applications for industrial processes. Final report Nov 80-Feb 82, 8:20975 (R;US)
Institut Economique et Juridique de l'Energie, Grenoble (France)
Development of optimization model for energy system program analysis and models of energy systems, 8:20766 (R;FR;FR)
Institute for Basic Research, Cambridge, MA (USA). Div. of Physics
Lie algebras and flexible Lie-admissible algebras. Hadronic press monographs in mathematics Number 1, 8:22590 (R;US)
Lie-admissible approach to the hadronic structure. Volume II. Covering of the Galilei and Einstein relativities. Hadronic press monographs in theoretical physics Number 2, 8:22561 (R;US)
Institute of Gas Technology, Chicago, IL (USA)
Anaerobic sludge digestion with a biocatalytic additive, 8:20998 (R;US)
Chemistry of ash deposits in the U-GAS process, 8:19421 (R;US)
Coal-gasification-process concepts, 8:19424 (R;US)
Effect of building characteristics on gas-appliance performance and end-use efficiency. Final report 1 Dec 80-31 Oct 81, 8:20917 (R;US)
Effect of impure refrigerants on evaporative chillers, 8:21333 (R;US)
Electrolyte vaporization losses from molten-carbonate fuel cells, 8:20885 (R;US)
Experimental evaluation of NO/sub x/ control using a glass tank simulator, 8:21695 (R;US)
Fluid bed consisting of fluid-bed units: a new fluidization method, 8:21190 (R;US)
Gas saturation in formation waters: Volume 1. Annual report Apr 80-Mar 81, 8:19751 (R;US)
Gas saturation in formation waters: Volume 2. Annual report Apr 80-Mar 81, 8:19752 (R;US)
Solar-assisted hydrogen generation by photoelectrocatalysis. Annual report mar 80-feb 81, 8:19915 (R;US)
Wastewater reclamation and methane production using water hyacinth and anaerobic digestion, 8:20997 (R;US)
Institute of Nuclear Energy Research, Lung-Tan (Taiwan)
EQUIPOISE3; two-dimensional, two group diffusion is slabs or cylinders, 8:22423 (R;US)
FEVER; one-dimensional, few-group diffusion depletion program, 8:20390 (R;US)
RELOAD FEVER; one-dimensional, few-group diffusion depletion, 8:20467 (R;US)
SAFE-AXISYM; stress analysis of axisymmetric load, 8:21307 (R;US)
Institute of Space and Astronautical Science, Tokyo (Japan)
X-ray astronomy program in Japan, 8:22114 (R;US)
Institutet foer Vatten- och Luftvaardsforskning, Stockholm (Sweden)
Lakes as a heat source for residential heating: a survey of costs in comparison with different systems and ecological consequences, 8:20940 (TG;US)
Institut fuer Kerntechnik und Energiewandlung e.V., Stuttgart (Germany, F.R.)
Development of a modular heat exchanger with integrated latent heat energy store. Final report, Dec. 1979, 8:20139 (R;DE;In several languages)
Input data for the Federal Republic of Germany for the energy demand model MEDEE-3, 8:20792 (R;XE)
Investigation of medium and high temperature phase change materials for thermal energy storage. Final report, Apr. 1980, 8:20140 (R;DE;In several languages)
Instituto de Pesquisas Espaciais, Sao Jose dos Campos (Brazil)
Time delays in solar bursts measured in the mm-cm range of wavelengths, 8:22076 (R;US)
Institut Royal Meteorologique de Belgique, Brussels
Measurement of the solar constant, 8:22082 (R;US)

International Atomic Energy Agency, Vienna (Austria)
  Diversion analysis and safeguards measures for liquid-metal fast-breeder reactors. Paper IAEA-SM-260/6, 8:20421 (R;US)
  Management of wastes from uranium mining and milling, 8:19869 (R;XA)
  Radioimmunoassay and related procedures in medicine 1982, 8:21919 (R;XA)
International Coal Refining Co., Allentown, PA (USA)
  SRC-I quarterly technical report, July-September 1982, 8:19474 (R;US)

Influences of environmental chemicals on the climate and biological after-effects, 8:21712 (R;DE;In German)

Kilkelly Environmental Associates, Inc., Raleigh, NC (USA)
Continuous-emission monitoring in the electric-utility industry. Final report, 8:20837 (R;US)

KM Sciences, Arlington, VA (USA)
Final report of work in support of the Nrl Fel program. Final report 14 Mar-15 Sep 82, 8:21381 (R;US)

KMS Fusion, Inc., Ann Arbor, MI (USA)
Free electron lasers for transmission of energy in space. final report, 8:21397 (R;US)

Knolls Atomic Power Lab., Schenectady, NY (USA)
CLEM; angular distribution Legendre fitting, 8:20547 (R;US)
CURFIT; curve fitting experimental data points, 8:20491 (R;US)
DATATRAN2; modular programming and data system, 8:22828 (R;US)
DATATRAN2 RAD1 Geometry Modules; radial geometry modules for two-dimensional imput, 8:21325 (R;US)
DATATRAN2 Utility Plotting Modules; utility plot modules f(x) & f(x,y), 8:21326 (R;US)
DOGGY; desk calculator form sheet DP package, 8:22830 (R;US)
3DXT;DEP3; 3-dimensional xenon transient and depletion, 8:20534 (R;US)
DYNO1; photomultiplier electron distribution, 8:21624 (R;US)
FINEL; finite-element study in two,-and three-dimensonal structures, 8:21324 (R;US)
GASPAN; complex gamma-ray spectra analysis, 8:21566 (R;US)
GEM; eigenvalue problem for vibrating systems, 8:21316 (R;US)
JP1XR; coupled-channel scattering cross section calculations, 8:22504 (R;US)
KAPLPLOT; KAPL CalComp plotting routines, 8:22837 (R;US)
LION4;LION; three-dimensional temperature distribution program, 8:20565 (R;US)
LIZARD4; nonlinear differential equations solution, 8:22833 (R;US)
MOST; a multidimensional optimization scheme, 8:22834 (R;US)
MULTI; multi-level resonance theory cross section calculations, 8:20550 (R;US)
PHASER; phase shift cross section and polarization calculations, 8:22505 (R;US)
RAPP; high-velocity flow study of steam-water mixtures, 8:21409 (R;US)
RAUMZEIT; one-dimensional time-dependent diffusion calculations, 8:22464 (R;US)
ROPE; finding roots of a polynomial, 8:22832 (R;US)
SIMPLE1; time-sharing programming language, 8:22831 (R;US)
SNEQ; nonlinear algebraic equation solutions and curve plotting, 8:22827 (R;US)
SOR3; stress analysis of shells of revolution, 8:21306 (R;US)
SORSDB; pressure vessel stress and fatigue, 8:20567 (R;US)
STEM; matrix generation for a system of beams, 8:21315 (R;US)
STINT3; single-channel space-time synthesis, 8:22481 (R;US)
TIGIR2; modular document information system, 8:22889 (R;US)
TUBE; u-tube heat exchanger stress analysis, 8:21319 (R;US)

Kraftanlagen A.G., Heidelberg (Germany, F.R.)
The MIT Abu El Kom solar demonstration project in Egypt. Phase a: solar thermal installations. Final report, Mar. 1980, 8:20082 (R;DE;In several languages)

Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.)
Requirements for heat resistant and highly heat resistant materials in the construction of stationary turbines, 8:21062 (R;DE;In German)

KVB, Inc., Irvine, CA (USA)
Emissions from refinery process heaters equipped with low-Nox burners. Final report Oct 80-Jan 81, 8:19720 (R;US)
OD3P report. Status report, 8:21299 (R;US)

KVB, Inc., Minneapolis, MN (USA)
Thirty-day field tests of industrial boilers: site 5 - gas-fired low-Nox burner. Final report Mar 79-Mar 80, 8:21457 (R;US)
Thirty-day field tests of industrial boilers: site 6 - gas-fired fire-tube boiler. Final report mar 79-mar 80, 8:21458 (R;US)

Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst.
Experimental study on natural-convection boiling burnout in an annulus, 8:20684 (R;US)
KUCA critical experiments using MEU fuel (II), 8:20644 (R;US)
Liquid transfer and entrainment correlation for droplet-annular flow, 8:20683 (R;US)

L

Law Engineering Testing Co., Marietta, GA (USA)
Permeability of selected sediments in the vicinity of five salt domes in the Gulf Interior Region, 8:22034 (R;US)
Salt, caprock, and sheath study, 8:22063 (R;US)

Lawrence Berkeley Lab., CA (USA)
ANALYZE; hydrothermal reservoir test analysis, 8:20170 (R;US)
Atmospheric aerosol research. Excerpt from the Energy and Environment Division annual report, FY 1981, Chapter 4, 8:21737 (R;US)
CCC; one-phase conduction convection compaction, 8:20171 (R;US)
DEVOG; coupled molecular scattering equations, 8:22334 (R;US)
Earth Sciences Division annual report 1981, 8:22031 (R;US)
Efficient, radiation-hardened, 800-keV neutral beam injection system, 8:22739 (R;US)
Eikonal theory of the transition to phase incoherence, 8:22625 (R;US)
Energy efficiency in Chinese apartment buildings: parametric runs with the DOE.2 computer program, 8:20906 (R;US)
Erosion of hard-metal coatings, 8:21126 (R;US)
Erosion/corrosion newsletter (excerpted from LBL—13840), 8:21076 (R;US)
Expectations for old and new physics at high energy colliders, 8:22268 (R;US)
Four-layer, two-inch bore, superconducting dipole magnet, 8:21341 (R;US)

Low-noise wide-band amplifiers for stochastic beam cooling experiments, 8:21528 (R;US)
Max-IV disc cache, 8:22875 (R;US)
Methods for evaluating the DOE Appropriate-Technology Program: A review and compilation of evaluation methods, 8:20865 (R;US)
Microstructural influence on abrasive wear resistance of high-strength, high-toughness medium-carbon steels, 8:21074 (R;US)
Microstructures, transformations and properties of oxidation-resistant, iron-base, aluminum-modified alloys, 8:21073 (R;US)
Molecular-beam studies of primary photochemical processes, 8:21271 (R;US)
Neutral-particle-beam production and injection, 8:22740 (R;US)
Nuclear reactions and synthesis of new transuranium species, 8:22392 (R;US)
Nuclear-waste isolation in the unsaturated zone of arid regions, 8:19853 (R;US)
PC; coupled molecular scattering equations, 8:22335 (R;US)
Photosensitized electron transport across lipid vesicle walls, 8:20001 (R;US)
Progress in energy-efficient buildings, 8:20907 (R;US)
Ramp rate sensitivities of several superconducting dipole magnets operated in He I and superfluid He II, 8:21340 (R;US)
Selected hydrologic and geochemical issues in site characterization for nuclear waste disposal: flood basalts at the Hanford Reservation, 8:19854 (R;US)
Source, origin, and propagation of quenches measured in superconducting dipole magnets, 8:21339 (R;US)
TERZAGI; isothermal fluid flow & subsidence, 8:20173 (R;US)
WELBORE; transient wellbore fluid flow model, 8:20174 (R;US)

Lawrence Livermore National Lab., CA (USA)

Acceptance testing of two 24" lathes, 8:21357 (R;US)
Alpha Survey Meter (Engineering Materials), 8:21615 (E;US)
ANCON; space-independent reactor kinetics code, 8:20535 (R;US)
ANGCOR; directional correlation coefficients, 8:22514 (R;US)
Atomic processes in high-density plasmas, 8:22748 (R;US)
Blast attenuation in a shot tunnel using water jets, 8:21669 (R;US)
Calculation and interpretation of In-Situ measurements of initial radiations at Hiroshima and Nagasaki, 8:21935 (R;US)
Can fiber-composite flywheels increase automobile fuel economy, 8:21032 (R;US)
Comments on "Technology for the renewal of transportation infrastructure", 8:21030 (R;US)
Computer simulation of concrete penetration by shaped-charge jets, 8:21656 (R;US)
DAC1; SN perturbation code using DTF4 fluxes, 8:20525 (R;US)
3DDT; 3-dimensional multigroup diffusion xyz or r-theta-z, 8:20528 (R;US)
Decision-making in large-scale military simulation: a requirement for expert systems, 8:22823 (R;US)
Determination of static friction of beryllium to beryllium and beryllium to 1040 steel, 8:21089 (R;US)
Efficient, radiation-hardened, 800-keV neutral beam injection system, 8:22739 (R;US)
Electronics Engineering Department Computer Program Newsletter No. 8: image-processing computer codes, 8:22878 (R;US)
Electronics Engineering Department quarterly report No. 2, 1982, 8:21445 (R;US)
Energy and Technology Review, 8:22163 (R;US)
EQ3/6; chemical equilibrium of aqueous systems, 8:21154 (R;US)
Equation of state data of APC 2.5, 8:21169 (R;US)
Equipment fragility data base. Seismic Safety Margins Research Program, 8:20717 (R;US)
EXPALS; least squares exponential decay curves, 8:21289 (R;US)
Experiments on hot-electron ECRH in the Tandem Mirror Experiment-Upgrade, 8:22633 (R;US)
Explicit particle-dynamics model for granular materials, 8:21685 (R;US)
Fusion-neutron effects on magnetoresistivity of copper stabilizer materials, 8:22744 (R;US)
GENRD; free-format card input processor, 8:22842 (R;US)
H-Division quarterly report, July-September 1982, 8:22564 (R;US)
High-power microwave-pulse susceptibility of discrete semiconductor devices, 8:21621 (R;US)
ICRF pumping in the TMX-U transition region, 8:22750 (R;US)
Improbability of a resonance breakdown in quasi-optical ECRH beam systems for the Magnetic Fusion Test Facility and other mirror systems, 8:22743 (R;US)
Initial ICRF heating experiments in the TMX-U central cell, 8:22749 (R;US)
I.R. emission measurements of shocked rocket propellants by time-resolved infrared radiometry, 8:21655 (R;US)
Laser phosphate glasses, 8:21176 (TG;US)
LASL group-averaged cross-sections; SN 18- 24- and 25-group sets, 8:20548 (R;US)
Leaching study of nuclear melt glass: Part I, 8:19888 (R;US)
Line-coincidence schemes for producing laser action at soft-x-ray wavelengths, 8:21402 (R;US)
Managing information for effective use: a case study, 8:22893 (R;US)
Mechanical engineering research. Quarterly progress report, October-December 1982, 8:21354 (R;US)
Microwave generator experiment at LLNL, 8:21495 (R;US)
Neutron REM survey meter (Engineering Materials), 8:21613 (E;US)
Nonlocal Boltzmann theory of plasma channels, 8:22632 (R;US)
Particle-dynamics calculations of shear flow, 8:22234 (R;US)
PELE-IC; fluid-structure interaction analysis, 8:21417 (R;US)
PHENIX; 2-dimensional diffusion burnup refueling history, 8:20408 (R;US)
PORTABLE LISP; a list-processing interpreter, 8:22844 (R;US)
Practical heat conduction for everday problems (CE3142) (Engineering Materials), 8:21430 (E;US)
Precision-leveling surveys near the Lawrence Livermore National Laboratory site (1969 through 1980), 8:21849 (R;US)
Preliminary conceptual design study of a suppressed-fission tokamak hybrid, 8:22745 (R;US)
Processing, cure reactions, network structure and mechanical properties of TGDDM/DDS epoxies, 8:21143 (R;US)
Protecting against failure by brittle fracture in ferritic-steel shipping containers greater than four-in. thick, 8:21356 (R;US)
Reevaluation of an individual's radiation exposure at NTS in 1963-64, 8:21972 (R;US)
Report to the DOE Nuclear Data Committee, 1983, 8:22347 (R;US)
Response of porous beds to rapid gas pressurization, 8:21653 (R;US)
Review of intense-ion-beam propagation with a view toward measuring ion energy, 8:22631 (R;US)
Review of quantum Monte Carlo methods and results for Coulombic systems, 8:22565 (R;US)
Seismic hazard analysis overview and executive summary, 8:20712 (R;US)
Summary of ignition and growth modeling of shock initiation and delayed detonation in full-density and porous propellants, 8:21654 (R;US)
Technical evaluation report on the proposed technical specification change on the surveillance requirements for the response-spectrum recorder at Arkansas Nuclear One, Unit 2. (Docket No. 50-368), 8:20385 (R;US)
Technical evaluation report (Revision 1) on the proposed design modifications and technical specification changes on grid voltage degradation for the Peach Bottom Atomic Power Station, Units 2 and 3, 8:20729 (R;US)
Time-tying of EMP test data, 8:21355 (R;US)
Tritium effects on germ cells and fertility, 8:21973 (R;US)
Underground coal gasification data base, 8:19533 (R;US)
Vapor pressure of shale oil and prediction of condenser performance, 8:19785 (R;US)
VUGRAPH; plots presentation-quality viewgraphs, 8:22854 (R;US)

Lehigh Univ., Bethlehem, PA (USA). Biotechnology Research Center

New method for simultaneous saccharification and fermentation. Final report, 8:19991 (R;US)

Lehigh Univ., Bethlehem, PA (USA). Dept. of Mechanical Engineering and Mechanics

Heat transfer to tubes in freeboard space of fluidized-bed combustors. Progress report, August 1, 1982-February 1, 1983, 8:20265 (R;US)

Lehigh Univ., Stone Harbor, NJ (USA). Wetlands Inst.

Ecological studies of wood-boring bivalves in the vicinity of the Oyster Creek Nuclear Generating Station. Progress report Sep-Nov 81, 8:21876 (R;US)

Levelton (B.H.) and Associates Ltd., Vancouver, British Columbia (Canada)

Wood-waste fuels preparation and handling, 8:20014 (R;CA)

Lewis (John S.) Associates, Inc., Natick, MA (USA)

Isolated grain condensation behavior: computation methods and first results. Final report, 8:22095 (R;US)

Leybold-Heraeus G.m.b.H. und Co. K.G., Hanau (Germany, F.R.)
- Process development for large-scale production of CdS thin film solar cells sputtered copper sulfide layers and cadmium sulfide-copper sulfide heteorojunctions. Application of high rate sputtering using hot-pressed targets. Final report, 8:19980 (R;DE;In several languages)

Leybold-Heraeus G.m.b.H. und Co. K.G., Koeln (Germany, F.R.)
- Development of cryorefrigerators. Final report, September 1980, 8:21331 (R;DE;In several languages)

Little (Arthur D.), Inc., Cambridge, MA (USA)
- Break-up of oil on rough seas - simplified models and step-by-step calculations. Final report, 8:19721 (R;US)
- Engineering evaluation of radon daughter removal techniques. Open file report (final), 8:19893 (R;US)
- Evaluation of existing programs for simulation of residential building energy use. Final report, 8:20930 (R;US)
- Responses of airborne biota to microwave transmission from satellite power system. Final report, 8:22023 (R;US)
- Whey protein concentrate market enhancement. Final report, 8:20016 (R;US)

Litton Systems, Inc., Bethesda, MD (USA). Environmental Systems Div.
- Preliminary air pollution survey of hydrogen sulfide: a literature review, 8:21768 (R;US)

Lockheed-California Co., Burbank (USA)
- Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 1: load alleviation/extended span development and flight tests. Final report, 8:20952 (R;US)

Lockheed Missiles and Space Co., Inc., Sunnyvale, CA (USA)
- Solar cell modules for plasma interaction evaluation. Final report, 8:20005 (R;US)

Lockheed Missiles and Space Co., Palo Alto, CA (USA)
- A preliminary design of the cryogenic system for the Cooled Limb Scanning Interferometer Radiometer (CLIR), phase 3. Final report, 8:21345 (R;US)
- Atmospheric emission photometric imaging, 8:22171 (R;US)
- Wolter type i LAMAR, 8:22116 (R;US)

Lockheed Missiles and Space Co., Sunnyvale, CA (USA)
- ISOTOPES; maximum yield from reaction or decay, 8:19902 (R;US)

Long Island Lighting Co., Mineola, NY (USA)
- Design and demonstration of a storage assisted air conditioning system, 8:20911 (R;US)

Los Alamos National Lab., NM (USA)
- ACSAP; resonance region cross section analysis, 8:22512 (R;US)
- Active tuning of rf cavities, 8:21527 (R;US)
- Anion exchange x-ray-fluorescence determination of uranium in plutonium, 8:21215 (R;US)
- ANSDDF; ANSI data description file utilities, 8:22890 (R;US)
- APACHE; two-dimensional chemically reactive fluid flow code, 8:21415 (R;US)
- ARRRG;FOOD; aquatic & terrestrial radiation, 8:21943 (R;US)
- BGO in several satellite-borne applications, 8:21580 (R;US)
- BNWIGL;UNIWIGL; two-group time-dependent one-dimensional diffusion, 8:22510 (R;US)
- Candidate sites for future hot-dry-rock development in the United States, 8:20149 (R;US)
- Comparison of COMPARE and BEACON subcompartment analyses of Battelle-Frankfurt containment tests, 8:20720 (R;US)
- DACRIN; radiation organ dose from inhalation, 8:21941 (R;US)
- Daily results of the initial operation of the Los Alamos salt-gradient solar pond, 8:20128 (R;US)
- Deformation of microstructures due to low-velocity particulate erosion of ductile metals by spherical particles, 8:21072 (R;US)
- DESA; district energy system cost energy model, 8:20994 (R;US)
- Economic analysis of four passive-cooling strategies for commercial office buildings, 8:19974 (R;US)
- Economics of utility oil and gas substitution: national and region-specific analysis, 8:19715 (R;US)
- Electronic structure and bonding in transuranics: comparison with lanthanides, 8:22196 (R;US)
- Energy balance and photochemical processes in the inner coma, 8:22077 (R;US)
- Energy-conservation study for the US Air Force Academy, 8:20905 (R;US)
- Evaluating the performance of passive-solar-heated buildings, 8:20097 (R;US)
- Evaluation of environmental control technologies for commercial uranium nuclear fuel fabrication facilities, 8:19881 (R;US)
- EVENT user's manual: a computer code for analyzing explosion-induced gas-dynamic transients in flow networks, 8:21439 (R;US)
- Examination of fast-reactor fuels and FBR analytical quality-assurance standards and methods. Progress report, July 1-September 30, 1982, 8:20429 (R;US)
- Explosively produced fracture of oil shale. Progress report, July-September 1982, 8:19779 (R;US)
- Extended-burnup calculations for operating-reactor reload reviews, 8:20347 (R;US)
- FESH; x-y multi-group neutron transport method, 8:22508 (R;US)
- Finite-element approach to analyzing coupled thermal-hydraulic problems, 8:21423 (R;US)
- GETOUT; radionuclide transport geologic media, 8:21870 (R;US)
- GLEN; group constant calculations from TOR output data, 8:22468 (R;US)
- GRAIL; a device-independent graphics language, 8:22860 (R;US)
- Guidelines for conservation levels and for sizing passive-solar collection area, 8:20098 (R;US)
- Heuristic introduction to gravitational waves, 8:22562 (R;US)
- HEXEREI2; HTGR thermal-hydraulic analysis, 8:20667 (R;US)
- High-efficiency free-electron laser results, 8:21388 (R;US)
- ICARUS; redundant system unavailability model, 8:20668 (R;US)
- INTEROP; nonlinear optimization algorithms, 8:22848 (R;US)
- Ka-band microwave generation using the Smith-Purcell effect, 8:21444 (R;US)
- KAPPAS; semiclassical transmission probability, 8:22340 (R;US)
- K-FIX;3D; three-dimensional extension two-phase flow dynamics, 8:20553 (R;US)
- K-TIF; two-fluid PWR downcomer fluid dynamics, 8:20351 (R;US)
- LAMPF II main-ring lattice with low transition energy, 8:21494 (R;US)
- LARCA; flux-weighting of DTF4 cross sections, 8:22486 (R;US)
- Los Alamos National Laboratory Building Cost Index, 8:21338 (R;US)
- Los Alamos portable beta-ray spectrometer, 8:21579 (R;US)
- Measurement of radioactive contaminated wastes, 8:19833 (R;US)
- Mechanistic debris-bed packing model, 8:20697 (R;US)
- Melt depth and regrowth kinetics in pulsed laser annealing of silicon and gallium arsenide, 8:21167 (R;US)
- MINX; multigroup crossections from ENDF/B-IV data, 8:22507 (R;US)
- MNN; solution of close coupling equations, 8:22339 (R;US)
- MOCARS; mc distribution & simulation limits, 8:22861 (R;US)
- Molecular mechanisms of intercellular communication: transmembrane signaling, 8:21904 (R;US)
- Multiple-scattering corrections to the Beer-Lambert law, 8:22563 (R;US)
- New method for inverting the closed-orbit distortion problem, 8:21559 (R;US)
- NJOY; neutron & photon crossections from ENDF/B, 8:22513 (R;US)
- Numerical modeling of the formation of H^- ion beams in surface-plasma sources, 8:22752 (TG;US)
- Oblique interactions of detonation waves with explosive/metal interfaces, 8:21650 (R;US)
- OCTAVIA; pressure vessel failure probabilities, 8:20573 (R;US)
- Optical instrumentation for on-line analysis of chemical processes, 8:21216 (R;US)
- PABLM; accumulated environment radiation dose, 8:21944 (R;US)
- PAD; one-dimensional coupled Sn neutronics & hydrodynamics, 8:20671 (R;US)
- PASOLE; simulation of passive solar systems, 8:20080 (R;US)
- PDFPLOT; statistical distribution functions, 8:22846 (R;US)
- PECS3; probabilistic evaluation cladding life, 8:20413 (R;US)
- Plasma properties of driver gas following interplanetary shocks observed by ISEE-3, 8:22078 (R;US)
- Proceedings of the second LAMPF II workshop, 8:21519 (R;US)
- Proceedings of the second LAMPF II workshop, 8:21524 (R;US)
- RAS; reliability analysis for phased missions, 8:20669 (R;US)
- RELAP5/MOD1/018; LWR loss of coolant analysis, 8:20673 (R;US)
- rf plasma synthesis of ultrafine, ultrapure silicon carbide powder, 8:21125 (R;US)
- SALE; analytical chemistry quality control, 8:21192 (R;US)
- SALE2D; general transient fluid flow algorithm, 8:21418 (R;US)
- SCAP; point kernel single or albedo scatter, 8:22515 (R;US)
- SCORE-EVET; three-dimensional hydraulic reactor core analysis, 8:20610 (R;US)

Sentinel Gap basalt reacted in a temperature gradient, 8:22058 (R;US)
SHAFT79; two-phase geothermal reservoir model, 8:20172 (R;US)
SOLA-LOOP; two-phase flow network analysis, 8:21416 (R;US)
SOLA-VOF; transient fluid flow free boundaries, 8:21420 (R;US)
Source terms for the initial radiations, 8:21668 (R;US)
Space nuclear power and man's extraterrestrial civilization, 8:20448 (R;US)
Space reactors. Progress report, October 1981-March 1982, 8:20447 (R;US)
Spheromak heating with Alfven waves, 8:22624 (R;US)
Studies of transport of waste radionuclides, through soil at the Maxey Flats, Kentucky, waste-burial site, 8:19885 (R;US)
SUBDOSA; external dose airborne radionuclides, 8:21942 (R;US)
SUPERENERGY2; steady-state LMFBR core analysis, 8:20415 (R;US)
SURGTANK; reactor steam surge tank dynamics, 8:20572 (R;US)
Thermal and kinematic history of mantle xenoliths from Kilbourne Hole, New Mexico, 8:22030 (R;US)
TOR; thermal scattering for crystalline materials, 8:22546 (R;US)
Transport and reactor theory. Progress report, July 1-September 30, 1982, 8:22738 (R;US)
Two parallel formulations of particle-in-cell models, 8:22623 (R;US)
TWOTRAN2; two-dimensional, multigroup transport in xy, rz, and r theta geometries, 8:22466 (R;US)
Untangling the water gas shift from Fischer-Tropsch: a Gordian knot, 8:21251 (R;US)
Uranium hydrogeochemical and stream sediment reconnaissance of the Beaver NTMS quadrangle, Alaska. National Uranium Resource Evaluation, 8:19792 (R;US)
Uranium hydrogeochemical and stream sediment reconnaissance of the Sterling NTMS quadrangle, Colorado. National Uranium Resource Evaluation, 8:19793 (R;US)
Uranium hydrogeochemical and stream sediment reconnaissance of the Ketchikan NTMS quadrangle, Alaska. National Uranium Resource Evaluation, 8:19794 (R;US)
Vegetational analysis of a canyon ecosystem at Los Alamos, 8:21843 (R;US)
VENUS2; 2-dimensional coupled neutronics-hydrodynamics, 8:20659 (R;US)
VMCON; nonlinearly constrained optimization, 8:22865 (R;US)

Los Alamos Scientific Lab., NM (USA)
DTF4; one-dimensional, multigroup discrete ordinate program, 8:22432 (R;US)
Precise source location of the anomalous 1979 March 5 gamma ray transient, 8:22149 (R;US)

Louisiana Dept. of Transportation and Development, Baton Rouge (USA). Research and Development Section
Evaluation of asphalt cement extraction and recovery methods. Final report Oct 80-Jun 82, 8:20987 (R;US)

Louisiana State Univ., Baton Rouge (USA). Coastal Studies Inst.
The effects of weather systems, currents, and coastal processes on major oil spills at sea. Technical report, 8:19722 (R;US)

Louisiana State Univ., Baton Rouge (USA). Dept. of Physics and Astronomy
Studies of sub-micron devices with emphasis on MOS systems. Progress report, July 1, 1982-June 30, 1983, 8:21441 (R;US)

Lowell Observatory, Flagstaff, AZ (USA). Planetary Research Center
Current studies of CH_3D: ye olde line drive, 8:22132 (R;US)

Lufthansa G.m.b.H., Hamburg (Germany, F.R.)
Sideslip indication system as a fuel saving aid in jet transport aircraFt operation, 8:20949 (R;DE)

M

Maine Univ., Orono (USA)
High resolution alpha spectroscopy by liquid scintillation techniques. Master's thesis, 8:21584 (R;US)

Maine Univ., Orono (USA). Land and Water Resources Center
UV disinfection for onsite sand filter effluent, 8:21884 (R;US)

Mainz Univ. (Germany, F.R.). Fachbereich Rechts- und Wirtschaftswissenschaften
Relation between the Federal Law on Immission Control and the Private Neighbours Law, 8:21818 (R;DE;In German)

Manhattan Coll., New York (USA). Dept. of Chemical Engineering
Model for fabric-filter cleaning: single-element and multiple-compartment effects, 8:21691 (R;US)

Martin Marietta Corp., Baltimore, MD (USA). Environmental Center
Long-term benthic monitoring programs for the mesohaline Chesapeake Bay. Interim report, 8:20306 (R;US)

Martin Marietta Corp., Denver, CO (USA)
Second-generation photovoltaic-concentrator-array design, 8:20020 (R;US)

Maryland Dept. of Natural Resources, Annapolis (USA). Power Plant Siting Program
Power plant cumulative environmental impact report. Final report, 8:21830 (R;US)

Maryland Univ., College Park (USA)
Generation of narrow-band tunable radiation in the 1200-A spectral region, 8:21386 (R;US)

Maryland Univ., College Park (USA). Coll. of Business and Management
Annual report to Congress, 1979. Volume 3. Projections; energy programs/energy markets-overview; energy programs/energy markets-technical papers, 8:20790 (R;US)

Maschinenfabrik Augsburg-Nuernberg (M.A.N.) A.G., Muenchen (Germany, F.R.)
Stationary flywheel energy storage systems. Final report, 8:20735 (TG;US)

Mason and Hanger-Silas Mason Co., Inc., Amarillo, TX (USA)
Corner-turning characteristics of TATB/HMX/Kel-F mixtures, 8:21651 (R;US)

Mason and Hanger-Silas Mason Co., Inc., Leonardo, NJ (USA)
Testing truck-mounted vacuum and air conveyor systems for oil spill recovery, 8:19735 (R;US)

Massachusetts Inst. of Tech., Cambridge (USA)
Conceptual design of superconducting magnet system for magnetohydrodynamic (MHD) Engineering Test Facility (ETF) 200 MWE power plant. Final report, 8:20881 (R;US)
Cross-reaction networks in the catalytic hydrodenitrogenation of synthetic liquid fuels. Quarterly report, November 1, 1982-January 31, 1983, 8:21250 (R;US)
Evolution of x-ray astronomy, 8:22137 (R;US)
Interstellar, intracluster and supercluster gas, 8:22112 (R;US)
PL-MOD; fault tree analysis by modularization, 8:22857 (R;US)

Massachusetts Inst. of Tech., Cambridge (USA). Aeroelastic and Structures Research Lab.
SABOR4; discrete-element analysis of thin shells, 8:21323 (R;US)

Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Chemical Engineering
Boiling and spreading rates of instantanteous spills of liquid methane on water. Final report Sep 80-Aug 81, 8:19762 (R;US)

Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering
Coolant mixing in LMFBR rod bundles and outlet plenum mixing transients. Progress report, September 1, 1981-November 30, 1981, 8:20423 (R;US)
Coolant mixing in LMFBR rod bundles and outlet-plenum mixing transients. Progress report, March 1, 1982-May 31, 1982, 8:20425 (R;US)
TDIST3; community energy consumption analysis, 8:20963 (R;US)
Wire-wrapped rod-bundle heat-transfer analysis for LMFBR, 8:20424 (R;US)

Massachusetts Inst. of Tech., Cambridge (USA). Energy Lab.
Estimation of resources and reserves. Final report, 8:19673 (R;US)
Evaluation of models for predicting evaporative water loss in cooling impoundments. Final report, 8:20275 (R;US)
Individual burner fuel/air ratio control optical adaptive feedback control system. Final report, 8:21456 (R;US)

Massachusetts Inst. of Tech., Lexington (USA). Lincoln Lab.
Effects on the utility feeder of utility-interactive inverters at the Northeast Residential Experiment Station, 8:20036 (R;US)
InP materials, 8:21147 (R;US)
Natural Bridges National Monument photovoltaic power plant: maintenance manual, 8:20034 (R;US)
Photovoltaic-system evaluation at the Northeast Residential Experiment Station. Final report, November 1980-May 1982, 8:20035 (R;US)
Remote sensing of turbine engine gases. Final report 1 Oct 80-30 Sep 81, 8:21688 (R;US)

Materials Sciences Corp., Blue Bell, PA (USA)
Thermomechanical response of gr/pi composites. Final report, 1 October 1979-30 March 1981, 8:21140 (R;US)
Mathematical Sciences Northwest, Inc., Bellevue, WA (USA)
Pacific northwest industrial energy load analysis. Final report May 81-Feb 82, 8:19760 (R;US)
Mathtech, Inc., Arlington, VA (USA)
Mini-assessment of environmental trends and problems: alternative feedstocks. Final report, 8:19687 (R;US)
Max-Planck-Gesellschaft zur Foerderung der Wissenschaften e.V., Berlin (Germany, F.R.). Fritz-Haber-Institut
Helium 2 cooling systems for long term missions in space: phase separation and hybrid cooling systems, 8:21342 (R;DE;In German)
Max-Planck-Institut fuer Physik und Astrophysik, Garching (Germany, F.R.). Inst. fuer Astrophysik
Energy balance and photochemical processes in the inner coma, 8:22077 (R;US)
Max-Planck-Institut fuer Physik und Astrophysik, Garching (Germany, F.R.). Inst. fuer Extraterrestrische Physik
Observations of fast, transient gamma ray phenomena, 8:22079 (R;DE)
Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)
Final report on the scientific and engineering design of a soft X-ray diode array diagnostic system for JET (KJ 1), 8:22622 (R;DE)
Vacuum magnetic field and modular coil system of the advanced stellarator Wendelstein VII-AS, 8:22736 (R;DE)
Max-Planck-Institut fuer Quantenoptik, Garching (Germany, F.R.)
IR laser induced reactions: temperature distributions and detection of primary products, 8:21283 (R;DE;In German)
Max-Planck-Institut fuer Stroemungsforschung, Goettingen (Germany, F.R.)
Direct investigation of hydrogen chloride elimination from 1,2-dichlorothane by laser induced radical chain reactions, 8:21272 (R;DE;In German)
Rainbow scattering of low energy Li ions on W single crystal surfaces, with special regard to the azimuthal dependence, 8:22198 (R;DE;German)
McDonnell Douglas Astronautics Co., St. Louis, MO (USA)
Materials selection for the US INTOR divertor collector plate, 8:22689 (R;US)
McDonnell Douglas Corp., Huntington Beach, CA (USA)
Development of a consensus standard for determining thermal performance of high-concentration-ratio solar collectors, 8:20135 (R;US)
McKee (Davy) Corp., Cleveland, OH (USA)
Coal-gasification basic research and cost studies. Quarterly report No. 5, 8:19432 (R;US)
McMaster Univ., Hamilton, Ontario (Canada). Dept. of Engineering Physics
PARTI; optimal group or mesh collapsing, 8:22488 (R;US)
Mechanical Technology, Inc., Albany, NY (USA)
Technology Demonstrator Engine (TDE). Period test report, August 1979-May 1981, 8:20269 (R;US)
Mechanical Technology, Inc., Latham, NY (USA)
Automotive Stirling-Engine Development Program. Semiannual technical progress report, July 1-December 31, 1981, 8:21021 (R;US)
Dynamic analysis of slurry letdown valves at H-Coal pilot plant, 8:19433 (R;US)
Messerschmitt-Boelkow-Blohm G.m.b.H., Ottobrunn (Germany, F.R.)
Comparison of concepts for solar-heated or solar-driven absorption and compression cooling machines for air conditioning and food preservation purposes, phase 1. Final report, Nov. 1978, 8:20083 (R;DE)
Organic fluids for the practical use in energy conversion systems of solar power plants. Final report, Jun. 1980, 8:20052 (R;DE;In several languages)
Miami Univ., Coral Gables, FL (USA). Clean Energy Research Inst.
Miami international symposium on metal-hydrogen systems, 8:19929 (R;US)
Michigan Research Center, Inc., East Lansing (USA)
Evaluative studies in nuclear medicine research: positron computed tomography assessment. Final report, January 1, 1982-December 31, 1982, 8:21912 (R;US)
Michigan State Univ., East Lansing (USA)
Shape transitions at high spin, 8:22375 (R;US)
Michigan State Univ., East Lansing (USA). Dept. of Physics
Progress report and renewal proposal, 8:22370 (R;US)
Michigan Univ., Ann Arbor (USA)
CINCAS; nuclear fuel cycle cost and economics, 8:20472 (R;US)
Michigan Univ., Ann Arbor (USA). Dept. of Electrical and Computer Engineering
Investigation of special-purpose processors for real-time synthetic-aperture-focusing techniques for nondestructive evaluation of nuclear-reactor vessels and piping components, 8:20344 (R;US)
Michigan Univ., Ann Arbor (USA). School of Public Health
Performance testing of personnel dosimetry services. A revised procedures manual, 8:22541 (R;US)
Performance testing of personnel-dosimetry services. Final report of test No. 3, 8:22540 (R;US)
Middle Tennessee State Univ., Murfreesboro (USA)
Nuclear-structure studies via neutron interactions. Progress report, July 1, 1982-June 30, 1983, 8:22358 (R;US)
Miljoestyrelsen, Roskilde (Denmark). Luftforureningslab.
Annual report for 1981, 8:19598 (R;DK;In Danish)
Mineraloelwirtschaftsverband e.V., Hamburg (Germany, F.R.)
Petroleum and pollution protection, 8:19729 (R;DE;In German)
Minerals Management Service, Metairie, LA (USA). Gulf of Mexico OCS Region
Final Regional Environmental Impact Statement. Volume 2, 8:21892 (R;US)
Final regional environmental impact statement. Volume 1. Gulf of Mexico, 8:21893 (R;US)
Minerals Management Service, New York (USA). Atlantic OCS Region
Proposed 1983 outer continental shelf oil and gas lease sale offshore the Mid-Atlantic states. Final environmental impact statement, 8:19730 (R;US)
Ministere de l'Environment et du Cadre de Vie, Neuilly (France)
The operational oil pollution surveillance system being used in France: forecasted future developments in consideration of the NATO/CCMS remote sensing pilot study conclusions, 8:19726 (R;FR)
Ministerium fuer Wirtschaft, Mittelstand und Verkehr des Landes Nordrhein-Westfalen, Duesseldorf (Germany, F.R.)
KDV-pressure gasification of coal, 8:19423 (R;DE;In German)
Minnesota Univ., Minneapolis (USA). Dept. of Chemical Engineering and Materials Science
Microstructural approach to fatigue-crack processes in polycrystalline bcc materials. Annual technical progress report IV, 8:21067 (R;US)
Minnesota Univ., Minneapolis (USA). School of Public Health
Evaluation of coal mine dust personal sampler performance. Final report, 8:19663 (R;US)
Mission Research Corp., Albuquerque, NM (USA)
Improved treatment of multiple scattering of intense charged particle beams. Interim report, 8:22419 (R;US)
KMRAD: a linearized particle code for the study of resistive instabilities. Final technical report, 8:21480 (R;US)
Resistive wall instabilities in the modified betatron. Revision 1. Interim report, 8:21481 (R;US)
Standing waves and notches in a parallel-plate type of EMP simulator and their reduction. Final report, 8:21659 (R;US)
Mission Research Corp., Santa Barbara, CA (USA)
Mass fire model concept. Final report 8 Sep 80-31 May 81, 8:21664 (R;US)
Missouri State Highway Dept., Jefferson City (USA). Div. of Materials and Research
Waste products in Missouri with potential highway application. Missouri cooperative highway research program (final), 8:21007 (R;US)
Missouri Univ., Columbia (USA). Dept. of Physics
Measurement of the physical structure of coal liquids by small-angle x-ray scattering. Final technical report, April 1, 1980-March 31, 1981, 8:19556 (R;US)
Small-angle x-ray scattering studies of the porosity of coals and chars. Final technical report, Sept. 30, 1978-March 31, 1981, 8:19545 (R;US)
Missouri Univ., Rolla (USA). Dept. of Electrical Engineering
Research support for plasma diagnostics on Elmo Bumpy Torus. Observations of EBT ring geometry by means of diamagnetic field measurements using a compensated ferromagnetic

resonance magnetometer, and a preliminary numerical study of EBT flux penetration dynamics, 8:22627 (R;US)

Missouri Univ., Rolla (USA). Dept. of Nuclear Engineering
Kinetics of radiation-induced segregation in ternary alloys, 8:20419 (R;US)

Mitre Corp., McLean, VA (USA). METREK Div.
Wood-fuel use in Papua New Guinea: an assessment of industrial combustion equipment, 8:20900 (R;US)

Mobil Solar Energy Corp., Waltham, MA (USA)
Stress studies in EFG. First quarterly progress report, July 9, 1982-September 30, 1982, 8:19996 (R;US)
Stress studies in EFG. Second quarterly progress report, October 1, 1982-December 31, 1982, 8:19997 (R;US)

Monsanto Research Corp., Miamisburg, OH (USA). Mound
COLCO; thermal diffusion column coefficients, 8:19903 (R;US)
Nonliquid surface preparation for electrodeposition, 8:21077 (R;US)
Pelletized Waste Form Demonstration Program. Volume II. Description and performance, 8:19855 (R;US)
Tester design concepts for Component Test Facility, 8:21652 (R;US)

Montana Energy and MHD Research and Development Inst., Inc., Butte (USA)
High-temperature fuel-cell research and development. Final technical progress report, 1 Oct 1980-30 Sep 1981, 8:20887 (R;US)

Montana State Univ., Bozeman (USA). Agricultural Experiment Station
Selective placement of strip mine overburden in Montana. V: summary report. Open file report Jul 76-Jun 81, 8:19604 (R;US)

Motor Industry Research Association, Nuneaton (UK)
Motor vehicle energy usage: a literature survey up to the end of 1974, 8:20948 (R;US)

MSA Research Corp., Evans City, PA (USA)
Evaluation of foams for mitigating air pollution from hazardous spills. Final report 29 Oct 76-31 Jul 80, 8:21758 (R;US)

Mueller Associates, Inc., Baltimore, MD (USA)
Status of alcohol fuels utilization technology for highway transportation: a 1981 perspective. Volume II. Compression-ignition engines, 8:21012 (R;US)

Muenster Univ. (Germany, F.R.). Sonderforschungsbereich 26 Raumordnung und Raumwirtschaft
Econometrical model of the energy demand of New York State, 8:20793 (R;DE)

Myers Associates, Inc., Towson, MD (USA)
Energy conservation manual for multi-family dwellings, 8:20899 (R;US)

N

Nagoya Univ. (Japan)
Workshop on first wall coating, 8:22737 (R;JP)

Nashville Electric Service, TN (USA)
Cogeneration energy-recovery facility feasibility study: environmental rport, 8:21000 (R;US)

National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center
Aluminum blade development for the MOD-OA 200-kilowatt wind turbine. Final report, 8:20231 (R;US)
Construction of low-cost, Mod-0A wood-composite wind-turbine blades, 8:20212 (R;US)
Covering solid, film cooled surfaces with a duplex thermal barrier coating, 8:21080 (R;US)
Durability/life of fiber composites in hygrothermomechanical environments, 8:21141 (R;US)
Evaluation of inelastic constitutive models for nonlinear structural analysis, 8:21454 (R;US)
Ion beam sputter deposited diamond like films, 8:21163 (R;US)
LANDSAT remote sensing: observations of an Appalachian mountaintop surface coal mining and reclamation operation, 8:21842 (R;US)
New strategy for efficient solar energy conversion: Parallel-processing with surface plasmons, 8:20004 (R;US)
Nonlinear structural and life analyses of a combustor liner, 8:21455 (R;US)
Tank testing of a 2500-cm2 solar panel, 8:20002 (R;US)

National Aeronautics and Space Administration, Greenbelt, MD (USA). Goddard Space Flight Center
A broad-band vlf-burst associated with ring-current electrons, 8:22174 (R;US)
Accretion disk coronae, 8:22144 (R;US)
Analysis of observational spectra, 8:22094 (R;US)
Astrophysical tests for radiative decay of neutrinos and fundamental physics implications, 8:22147 (R;US)
Broad band x-ray telescope (BBXRT), 8:22119 (R;US)
Charged particle motions in the distended magnetospheres of Jupiter and Saturn, 8:22152 (R;US)
Compact objects, 8:22087 (R;US)
Complete x-ray sample of the high latitude sky from HEAO-1 A-2: log N log S and luminosity functions, 8:22139 (R;US)
Cosmology, 8:22089 (R;US)
Detectors for energies greater than 10 MeV, 8:22093 (R;US)
Detectors for energies less than 10 MeV, 8:22092 (R;US)
Diffuse radiation, 8:22090 (R;US)
Experimental and theoretical studies of interstellar grains, 8:22148 (R;US)
Extragalactic gamma radiation: use of galaxy counts as a galactic tracer, 8:22153 (R;US)
Galaxies, 8:22088 (R;US)
Gamma ray interaction processes, 8:22091 (R;US)
Gamma ray observations of the solar system, 8:22084 (R;US)
Goddard contributions to the workshop on gamma ray transients, 8:22143 (R;US)
Helium, hydrogen, and oxygen velocities observed on isee-3, 8:22158 (R;US)
Infrared absorption by OH containing compounds, 8:22098 (R;US)
Inorganic spark chamber frame and method of making the same, 8:21452 (R;US)
Laser resonator, 8:21393 (R;US)
Neutral hydrogen in elliptical galaxies with nuclear radio sources and optical emission lines, 8:22146 (R;US)
Neutrino masses, neutrino oscillations, and cosmological implications, 8:22155 (R;US)

National Research Council, Washington, DC (USA). Committee on Disposal of Excess Spoil

Disposal of excess spoil from coal mining and the Surface Mining Control and Reclamation Act of 1977: a study of regulatory requirements, engineering practices, and environmental protection objectives, 8:19591 (R;US)

National Research Council, Washington, DC (USA). Committee on Ground-Water Resources in Relation to Coal Mining

Coal mining and ground-water resources in the United States, 8:19599 (R;US)

National-Standard Co., Niles, MI (USA)

National-Standard Company waste-tire fluidized-bed-combustion boiler project. Final report, 8:20970 (R;US)

Naval Ocean Systems Center, San Diego, CA (USA)

Possible effects of noise from offshore oil and gas drilling activities on marine mammals: a survey of the literature. Final report FY 80, 8:22021 (R;US)

Naval Postgraduate School, Monterey, CA (USA)

Energy forecasting models within the Department of the Navy. Master's thesis, 8:20756 (R;US)

MOD5; stochastic model of neutron slowing-down, 8:22502 (R;US)

Offshore transport and dispersion in the California coastal region - BLM III. NPS data summary. Technical report, 8:21856 (R;US)

Naval Research Lab., Washington, DC (USA)

Electron drift in a linear magnetic wiggler with an axial guide field. Memorandum report, 8:21375 (R;US)

Equilibrium of a high current electron ring in a modified betatron accelerator. Memorandum report, 8:21482 (R;US)

Flow-induced oscillations of OTEC mooring and anchoring cables: state of the art. Final report, 8:21465 (R;US)

New measurement techniques using tracers within laser-produced plasmas, 8:22741 (R;US)

XUV and x-ray spectra from Texas Experimental Tokamak plasmas. Memorandum report 1981-1982, 8:22596 (R;US)

Naval Submarine Medical Center, Groton, CT (USA). Submarine Medical Research Lab.

Position paper: the toxic effects of chronic exposure to low levels of carbon dioxide. Interim report, 8:21988 (R;US)

Naval Surface Weapons Center, Silver Spring, MD (USA)

Physical security modeling for the shipboard nuclear weapons security program, 8:21663 (R;US)

Naval Underwater Systems Center, New London, CT (USA). New London Lab.

New York City Police Department Automated Fuel Monitoring system. Volume I. Overview. Technical report, 8:20942 (R;US)

New York City Police Department Automated Fuel Monitoring system. Volume II. Documentation report. Technical report, 8:20943 (R;US)

NCB (IEA Grimethorpe) Ltd., Grimethorpe (UK)

Fluidised Bed Combustion Project, Grimethorpe Experimental Facility, 8:20259 (R;US)

Fluidised-bed combustion: IEA Grimethorpe pressurized fluidized-bed test facility incident report - combustor water wall damage during operation on March 17, 1981, 8:20258 (R;US)

Fluidised-bed combustion: IEA Grimethorpe pressurized fluidised-bed test facility incident report - performance of the exhaust-gas heat exchangers, 8:20261 (R;US)

Fluidised-bed combustion: IEA Grimethorpe pressurized fluidised-bed test facility incident report - booster-compresser failure, 8:20260 (R;US)

IEA Grimethorpe Pressurized Fluidised Bed Test Facility incident report: history of erosion on the primary and secondary quench vessel vent valves, 8:20257 (R;US)

NEA Data Bank, 91 - Gif-sur-Yvette (France)

JUPITOR1;JP1; coupled channel x-sec evaluation, 8:22452 (R;US)

Nebraska Univ., Lincoln (USA)

Biochemical and physiological characterization of higher plants with reduced photorespiration. Progress report, March 1, 1982-March 1, 1983, 8:21909 (R;US)

Nero and Associates, Inc., Portland, OR (USA)

Quantification of environmental costs and benefits study module VI. Final report, 8:21889 (R;US)

Nevada Univ., Reno (USA). Mackay School of Mines

Proceedings: support-structure corrosion in steam generators, 8:20356 (R;US)

Newcastle upon Tyne Univ. (UK)

The role of additives in the densification of nitrogen ceramics. Annual report no. 2 (final), 8:21118 (R;US)

Newcastle upon Tyne Univ. (UK). Transport Operations Research Group

Review of the commodity flow studies (1975-1979), 8:19622 (R;US)

The inland distribution of the products of North Sea oil, 8:19740 (R;US)

Newmark, Hansen and Associates, Urbana, IL (USA)

Biochemical changes in blood components after lethal doses of radiation. Final report Oct 80-Sep 81, 8:21939 (R;US)

Theory, electro-optical design, testing, and calibration of a prototype atmospheric supersaturation, humidity, and temperature sensor. Final report Mar 81-Jul 82, 8:21938 (R;US)

New Mexico Bureau of Mines and Mineral Resources, Socorro (USA)

Contamination of ground and surface waters due to uranium mining and milling. Volume I: Biological processes for concentrating trace elements from uranium mine waters. Open file report 25 Jul 79-14 Sep 81, 8:19886 (R;US)

New Mexico Energy and Minerals Dept., Santa Fe (USA)

Preparing for possible motor-fuel shortages: a community planning guide, Grants, New Mexico, 8:20954 (R;US)

Preparing for possible motor-fuel shortages: a community planning guide, Taos, New Mexico, 8:20955 (R;US)

New Mexico Health and Environment Dept., Santa Fe (USA). Environmental Improvement Div.

Hydrologic analyses of two brine encounters in the vicinity of the Waste Isolation Pilot Plant (WIPP) Site, 8:22028 (R;US)

Review comments on Environmental Analysis Cost Reduction Proposals (WIPP-DOE-136), July 1982, 8:19816 (R;US)

New Mexico Inst. of Mining and Technology, Socorro (USA). New Mexico Petroleum Recovery Research Center

Large-scale stimulation of a low-permeability Permian Pennsylvanian, gas reservoir, 8:19765 (R;US)

New Mexico State Highway Dept., Santa Fe (USA)

Preparing for possible motor-fuel shortages: a community planning guide, Grants, New Mexico, 8:20954 (R;US)

Preparing for possible motor-fuel shortages: a community planning guide, Taos, New Mexico, 8:20955 (R;US)

New Mexico State Univ., Las Cruces (USA). Dept. of Chemical Engineering
Enhanced oil recovery by CO_2 foam flooding, 8:19681 (R;US)

New Mexico Univ., Albuquerque (USA)
Aspects of high-energy laser theory. Final report, 8:21379 (R;US)
IIR algorithms for adaptive line enhancement, 8:21631 (R;US)

New Mexico Univ., Albuquerque (USA). Computing Center
DOBIS multiple data base support as implemented at Sandia National Laboratories Technical Library, 8:22877 (R;US)

New Mexico Univ., Albuquerque (USA). Dept. of Chemical and Nuclear Engineering
Chip desorption and pore-structure effects in methane release from coal. Final report, 8:19764 (R;US)

New York State Energy Research and Development Authority, New York (USA)
Wind farm economics in the area of the city of Buffalo, 8:20208 (R;US)

New York Univ., NY (USA). Dept. of Physics
Heavy particle collisions, 8:22175 (R;US)

Niels Bohr Inst., Copenhagen (Denmark)
Nuclear shape transitions and some properties of aligned-particle configurations at high spin, 8:22374 (R;US)

Nokota Co., Bismarck, ND (USA)
Dunn-Nokota Methanol project, Dunn County, North Dakota. Volume I. Executive summary, 8:19948 (R;US)

North Carolina Central Univ., Durham (USA)
Optically pumped submillimeter-waves and applications. Final report, 8:21346 (R;US)

North Carolina State Univ., Raleigh (USA)
Long-duration thermal storage for solar-thermal high-pressure steam IPH, 8:20103 (R;US)

North Carolina State Univ., Raleigh (USA). Dept. of Chemical Engineering
Coal gasification/gas cleanup test facility: volume ii. environmental assessment of operation with devolatilized bituminous coal and chilled methanol. Final report Sep 80-Apr 81, 8:19601 (R;US)

North Carolina Univ., Chapel Hill (USA). Dept. of Environmental Sciences and Engineering
Smog chamber experiments to test oxidant related control strategy issues. Final report 1978-81, 8:21759 (R;US)

North Dakota Univ., Grand Forks (USA)
Synthesis of oligomeric models of coal derived materials for use with GPC calibration. Quarterly report, September 1982-November 1982, 8:19562 (R;US)

North Dakota Univ., Grand Forks (USA). Dept. of Chemistry
Homogeneous catalysis of lignite liquefaction with hydrogen sulfide, 8:19431 (R;US)

Northeastern Univ., Boston, MA (USA)
Probabilistic analysis for liquefaction, 8:22053 (R;US)

Northwestern Univ., Evanston, IL (USA)
Interphase transport in horizontal stratified cocurrent flow, 8:20713 (R;US)
Investigation of deep level defects in epitaxial semiconducting. Progress report, June 15, 1982-June 14, 1983, 8:21158 (R;US)

Northwestern Univ., Evanston, IL (USA). Dept. of Mechanical and Nuclear Engineering
Computer simulation of kinetic properties of plasmas. Final report, 8:22073 (R;US)

Northwestern Univ., Evanston, IL (USA). Dept. of Physics
Magnetic ordering and electronic structure of $CeAl_3$, 8:21059 (R;US)

Norwegian Air Survey Co., Oslo
Use of side looking airborne radar (SLAR) for oil pollution monitoring in norway, 8:19728 (R;FR)

Nossaman-Krueger and Knox, Washington, DC (USA)
Section 210 of PURPA and solar-thermal-energy development: the current regulatory environment and suggestions for future action. Task III report, 8:20055 (R;US)

Notre Dame Univ., IN (USA). Radiation Lab.
University of Notre Dame Radiation Laboratory quarterly report, October 1, 1982-December 31, 1982, 8:21285 (R;US)

NPS Energy Management, Inc., Washington, DC (USA)
Case studies in major bulk-power transactions, 8:20824 (R;US)
Financing new electric-generating facilities in deregulated markets: insights from analogous industries, 8:20825 (R;US)

Nuclear Assurance Corp., Atlanta, GA (USA)
U.S. reactor spent-fuel storage capabilities. Technical report, 8:20478 (R;US)

Nuclear Regulatory Commission, King of Prussia, PA (USA). Region I
NRC TLD direct radiation monitoring network: Progress report, October-December 1981. Technical report, 8:21838 (R;US)

Nuclear Regulatory Commission, Washington, DC (USA)
A collection of mathematical models for dispersion in surface water and groundwater, 8:21874 (R;US)
Advance notification of shipments of nuclear waste and spent fuel: guidance, 8:19812 (R;US)
Calculational limitations in PWR system simulation, 8:20682 (R;US)
Indexes to Nuclear Regulatory Commission Issuances, July-September 1981, 8:20459 (R;US)
NRC TLD (thermoluminescent dosimeter) direct radiation monitoring network. Technical progress report Jul-Dec 81, 8:21806 (R;US)
Nuclear property insurance: status and outlook, 8:20704 (R;US)
Nuclear Regulatory Commission Issuances, February 1982, 8:20461 (R;US)
Nuclear Regulatory Commission Issuances, January 1982, 8:20460 (R;US)
Proceedings of the topical meeting on advances in reactor physics and core thermal hydraulics, 8:20554 (R;US)
Regulatory and technical reports: compilation for first quarter 1982, January-March, 8:20451 (R;US)
Report to Congress on abnormal occurrences, October-December 1981. Quarterly report, 8:20699 (R;US)
Systematic evaluation program status summary report, April 1982, 8:20700 (R;US)
Title list of documents made publicly available: documents from October through December 1978 for Dockets 50-334 through STN 50-597, 8:20453 (R;US)

Nuclear Regulatory Commission, Washington, DC (USA). Advisory Committee on Reactor Safeguards
Review and evaluation of the Nuclear Regulatory Commission Safety Research Program for Fiscal Years 1984 and 1985, 8:20705 (R;US)
